ENCYCLOPAEDIA LONDINENSIS;

OR,

UNIVERSAL DICTIONARY

OF

ARTS, SCIENCES, AND LITERATURE.

COMPREHENDING,

UNDER ONE GENERAL ALPHABETICAL ARRANGEMENT;

ALL THE WORDS AND SUBSTANCE OF

EVERY KIND OF DICTIONARY EXTANT IN THE ENGLISH LANGUAGE.

IN WHICH THE IMPROVED DEPARTMENTS OF

BRANCHES OF POLITE LITERATURE,

ARE SELECTED FROM THE

ACTS, MEMOIRS, AND TRANSACTIONS, OF THE MOST EMINENT LITERARY SOCIETIES,

IN EUROPE, ASIA, AND AMERICA.

FORMING A COMPREHENSIVE VIEW OF THE RISE, PROGRESS, AND PRESENT STATE, OF HUMAN

LEARNING IN EVERY PART OF THE WORLD.

EMBELLISHED BY A MOST

MAGNIFICENT SET OF COPPER-PLATE ENGRAVINGS,

ILLUSTRATING, AMONGST OTHER INTERESTING SUBJECTS,

THE MOST CURIOUS, RARE, AND ELEGANT, PRODUCTIONS OF NATURE, IN EVERY PART OF THE UNIVERSE;

AND ENRICHED

WITH PORTRAITS OF EMINENT AND LEARNED PERSONAGES, IN ALL AGES OF THE WORLD.

TOGETHER WITH

A COMPREHENSIVE AND CORRECT SYSTEM OF HERALDRY,

FINELY ILLUMINATED, AND ENRICHED WITH THE ARMORIAL BEARINGS OF THE ROYAL FAMILY;

OF THE ENGLISH, SCOTCH, AND IRISH, NOBILITY; OF THE BARONETS OF THE UNITED KINGDOM;

AND OF NUMEROUS DISTINGUISHED FAMILIES, PATRONS OF THIS WORK.

COMPILED, DIGESTED, AND ARRANGED,

BY JOHN WILKES, OF MILLAND HOUSE, IN THE COUNTY OF SUSSEX, ESQUIRE;

ASSISTED BY EMINENT SCHOLARS OF THE ENGLISH, SCOTCH, AND IRISH, UNIVERSITIES.

VOLUME IX.

London:

PRINTED FOR THE PROPRIETORS, BY J. ADLARD, DUKE-STREET, WEST SMITHFIELD: SOLD AT THE
ENCYCLOPAEDIA OFFICE, AVE-MARIA-LANE, ST. PAUL'S; BY J. WHITE, FLEET-STREET;
AND BY CHAMPANTE AND WHITROW, JEWRY-STREET, ALDGATE.

1811.
Non audiendi sunt homines imperiti, qui humano ingenio majorem, vel inutilem, et rebus gerendis adversum πολυμαγδερων criminantur. Est saltēt quaedam Scientiarum cognatio et conciliatio; unde et Ενεκλεφµανης vocant Graeci; ut in una perfectus dice nequeat, qui ceteras non attigerit.—Morhof Polyhistor, l. i. c. i. s. i.

Those inexperienced persons, who make it a charge of accusation against variety and extensive learning, that it exceeds the compass of human ability, or is useless, or that it is an impediment to transacting business, deserve no attention. For there is between the Sciences a degree of natural and close connexion; from which the Greeks use the term "Encyclopaedia," so that no one can be perfect in any one Science, who has not attained to some knowledge of the rest.
DESCRIPTION OF THE FRONTISPIECE ILLUSTRATING HERALDRY.

No. 750.
GREEN, adj. [grun, Germ. grün, Dut. groen] Having a colour formed commonly by compounding blue and yellow; of the colour of the leaves of trees or herbs. The green colour is said to be most favourable to the fight. —The general colour of plants is green, which is a colour that no flower is of: there is a greenish primrose, but it is pale and scarce a green. Bacon. —Pale; sickly: from whence we call the maid's disease the green sicknifs, or chlorosis. Like it is Sappho's φλοροτρόφις: 
Till the green sicknifs and love's force betray'd
To death's remorseful arms th'unhappy maid. G.rth.
Flourishing; fresh; undecayed; from trees in spring.—
If I have any where said a green old age, I have Virgil's authority; Sed cruda deo virifque fenex. Dryden. —New; fresh: as a green wound. —A man that flideth revenge
keepeth his own wounds green, which otherwife would heal and do well. Bacon.

Gries are green;
And all thy friends, which thou muft make thy friends,
Have but their flings and teeth newly ta'en out. Shak. 
Not dry.—If a spark of error have thus far prevailed, falling even where the wood was green, much not the peril thereof be greater in men, whose minds are of themselves as dry as fawd? Hooker.

Being an olive-tree
Which late he fell'd; and being green, must be Made lighter for his manage. Chapman.
Not roasted; half raw.—Under this head we may rank those words which signify different ideas, by a fort of far-fetched analogy; as when we fay the meat is green, when it is half roasted. Wace's Logic—Unripe; immature; young; because fruits are green before they are ripe.—If you would fat green geese, shut them up when they are about a month old. Mortimer.

O charming youth, in the first opning page;
So many graces in fo green an age. Dryden.

GREEN, s. The green colour; green colour of different shades. —Cinnabar, illuminated by this beam, appears of the fame red colour as in day-light; and if at the lens you intercept the green making and blue making rays, its redness will become more full and lively. Newton.—See the article Colour, vol. iv. p. 789–792. See also Chromatics, and the article Dying.—A gruffly plain:
The young Amylæ, fairer to be seen
Than the fair lily on the flow'ry green. 
Leaves; branches; wreaths.

With greens and flow'rs recruit their empty hives,
And seek fresh forage to sustain their lives.
Ev'ry brow with cheerful green is crowned;
The leaves are doubled, and the bowls go round. Dryden.

To GREEN, v. a. To make green. A low word:
Great Spring before
Green'd all the year; and fruits and blossoms blush'd
In sociai sweetnefs on the self-fame bough. Thomson.

GREEN, a county of the American States, in Washington district, state of Tennesee.
GREEN, a township of the American States, in Franklin county, Pennfylvania.—Also a township in Washington county, in the fame state.
GREEN, a poll-town of the American States, in Lincoln county, in the district of Maine, fuated on the east side of Androcooggin river, thirty-one miles west-by-south of Pittftown, thirty-nine north of Portland, and 164 north-by-eaft of Boston containing, by the cenfus of 1796, 639 inhabitants.

GREEN, a navigable river of the American States, Kentucky, which rises in Mercer county, has a gentle current, and is navigable nearly 150 miles. Its course is generally west; and at its confluence with the Ohio is upwards of 200 yards wide. Between the mouth of Green river and Salt river, a diftance of nearly 200 miles, the land upon the banks of the Ohio is generally fertile and rich; but, leaving its banks, the plain country is little better than barren land. On this river are a number of salt springs or licks; and also three springs or ponds of bitumen, which do not form a dream, but empty themselves into a common reervoir, and, when ufed in lamps, answer all the purpofes of the bell oil. Vast quantities of nitre are found in the caves on its banks; and many of the settlers manufacture their own gunpowder.

GREEN, a river of the American States, which rises in the town of Marlborough, in Vermont, and falls into Connecticut river above Deerfield, in Massachusetts.
GREEN (Matthew), a truly original English poet, born at London in 1696. The anecdotes of his life are extremely few. It is only known that his parents were difturers in good repute; that he received his education among the fect; and that he obtained a place in the culum-house, the duties of which he discharge with diligence and fidelity. His learning extended only to a little Latin; but from the frequency of his classical allusions, it appears that what he read when young, he did not forget. The religious aufferity in which he was bred had its common effect of infpiriting him with settled
difficult; and he fled from the gleam of that disseminating
in which tender plants are sheltered from the weather.

See the article Horticulture.

GREEN HUE, f. In the forest law, any thing green
within the forest.

GREEN ISLAND, a small island of England, in
the harbour of Poole.

GREEN ISLAND, a small island near the north-east
coast of New Holland: four leagues east-north-east from Cape Griffin.

GREEN ISLAND, an island in Hudson's Bay. Lat.
61° 2'. N. Lon. 72° 40'. W. Greenwich.

GREEN ISLAND, a small island near the east coast
of Antigua. Lat. 17° 13'. N. Lon. 61° 21'. W. Greenwich.

GREEN ISLAND, a small island of the West Indies,
about a mile north-east from the island of St. Thomas.

GREEN ISLAND, or Server Island, one of
the smaller Virgin Islands, claimed by the Spaniards, and
situated near the east end of Porto Rico.

GREEN ISLAND HARBOUR, a bay on the west-
ern extremity of the island of Jamaica. It furnishes good
anchorages, having Davis's Cove on the north-east, and
Half-moon and Orange bays on the south-west.

GREEN MOUNTAINS, a range of mountains in
North America, extending north-north-east to south-
west, and dividing the waters which flow easterly into
Connecticut river, from those which fall westerly into
Lake Champlain, Lake George, and Hudson's river.
The ascent from the east to the top of the Green
Mountain in Vermont, is much easier than from the
west, till you get to Onion river, where the mountain
terminates. The height of land is generally from twenty
to thirty miles from the river, and about the same distance
from the New-York line. The natural growth
upon this mountain is hemlock, pine, spruce, and other
evergreens; hence it has always a green appearance, and
upon this account has obtained the descriptive name of
Per Mona. On some parts of this mountain snow lies till late June, and four poor days thereafter through Massachussetts and Connecticut, and terminates in Newhaven. Kellington Peak, the highest of these
mountains, is about 3454 feet above the level of the
ocean.

GREEN RIVER, a river of Canada, which runs into
the river St. Lawrence, one hundred miles below Quebec.

GREEN SICKNESS, f. The disease of maidens, so
called from the paleness which it produces. See Chlo-
rosis.—Sour eruptions, and a craving appetite, es-
specialiy of terrestrial and abhorrent substances, are the
cafe of girls in the green sickness. Arbutnct.

GREEN SILVER, in the feudal law, an ancient
right from within the manor of Writtle, in the county of
Essex, where every tenant whole fore-door opens to
Greenbury, shall pay a halfpenny yearly to the lord,
by the name of green fiber. The term fiber, here, must
mean rent.

GREEN WAX, in law, is where ejectments are de-
livered to the sheriff out of the exchequer, under the
feal of that court, made in green wax, to be levied in
the several counties, by Stat. 7 Hen. IV. c. 3.

GREEN WEED, /. Dyers weed. See Genista.

GREENE, a town of Denmark, in North Jutland:
twenty-eight miles north-east of Aarhus.

GREENBERGH, a township of the American States,
in Wellchefer county, New-York, containing 1400 in-
habitants, of whom 164 are electors.

GREENBUSH, a township of the American States,
in Renshiater county, New-York; 164 of its inhabitants
are electors.

GREENCASTLE, a town of the American States,
in Franklin county, Pennsylvania, situated near the Co
ehogue creek.

Here are two Presbyterian churches. It is eleven miles south-by-
west of Chambersburg, and 156 west-by-south of Phila
delphia.

GREENE, a county of the American States, in Ken-
tucky,
perpetual ice, precluded all access. The ancient settlement may be traced in the map by Torfaeus, in his Groenlandia Antiqua; from which it would seem that the colony extended over about two hundred miles in the south-east extremity. On the west some ruins of churches have also been discovered.

About a hundred years after all intercourse between Norway and Greenland had ceased, several ships were sent successively by the kings of Denmark in order to discover the eastern district; but all of them miscarried. Among these adventurers, Magnus Hennißen, after having surmounted many difficulties and dangers, got sight of the land; which, however, he could not approach. At his return, he pretended that the ship had been arreled in the middle of her course by rocks of loadstone at the bottom of the sea. The same year, 1576, in which this attempt was made, captain Martin Probiher was sent upon the same errand by queen Elizabeth. He likewise desired the land; but could not get access to it, and the ship returned loaded with eight hundred cwt of fish; but not before he had failed sixty leagues in the strait which still retains his name, and landed on several islands, where he had some communication with the natives. He had likewise taken possession of the country in the name of queen Elizabeth, and brought away some pieces of ore, friars of high refining of London, contained a proportion of gold. In the ensuing spring he undertook a second voyage, at the head of a small squadron, equipped at the expense of the public; entered the frists a second time; discovered upon an island a gold and silver mine; bestowed names upon different bays, islands, and headlands; and brought away a landing of ore, together with two natives, a male and a female. Such was the success of this voyage, that an other was fitted out under the auspices of admiral Probiher, consisting of fifteen fail, including a consider-able number of soldiers, miners, smelters, carpenters, &c. who were to remain all the winter near the mines in a wooden fort, the different pieces of which they carried in several offtores. They met with stormy weather, impenetrable fogs, and violent currents, which retarded their operations until the season was too far advanced. The admiral therefore determined to return with as much ore as he could procure: of this they obtained large quantities out of a new mine, to which they gave the name of Countess of Suffex. This ship fell in the beginning of September, and after a month's stormy passage, arrived in England: but this adventure was never after prosecuted.

Thus food the affairs of Greenland, when Hans Egde, minifier of Vogen in Norway, prompted by a laudable zeal to promote the knowledge of Christ among the savage Greenlanders, made some proposals for renewing the intercourse between Denmark and Greenland, which had been discontinued for many centuries. Most of the friends and acquaintance of this worthy divine, when they heard of his project, looked upon it as a chimerical undertaking. However, in 1718, he resigned his benefice in the south part of Norway, and removed, with his wife and children, to Bergen. His proposals did not meet with a favourable reception, either from the merchants or clergy of that city. He therefore went to Copenhagen, in 1719, and laid his plan before the king; who sent an order to the magis-try of Bergen, to propose to the citizens the erecting of a Greenland company. This, after many difficulties, was at last effected in 1721, and a capital of 10,000 rix dollars was raised for that purpose. The company fitted out three ships for Greenland; and the
the indefatigable Egede was sent thither as missionary, and furnished with three hundred guilders by the company; but the trade carried on with Greenland brought in no great profit. In the mean while the missionary employed his time in learning the Greenland language; and by his liberality and fluency of manners, so endeared himself to the inhabitants, that the respect they showed him in some particulars, far exceeded his wishes; for they entertained such an exalted idea of his piety and virtue, that all the sick flocked about him, imploring him to heal them, being persuaded that his breathing on them would restore them to health.

His Danish majesty, in 1728, caused horses to be transported to New Greenland, in hopes that the settlers might, by their means travel over land to eastern or Old Greenland; but the icy mountains were found totally impassable. Lieutenant Richards, in a ship which had wintered near the new Danish colony, also attempted on his return to Denmark, to land in Old Greenland; but all his endeavours proved abortive. M. Egede gave his whole time, in the pursuit of his mission, to learning the Greenland language; and by the different groups of the natives he showed him, far exceeded his wishes; for they entertained such an exalted idea of his piety and virtue, that all the sick flocked about him, imploring him to heal them, being persuaded that his breathing on them would restore them to health.

In 1731, a royal edict was published, enjoining all the king's subjects in Greenland to return home; and the colonies were thereby dissolved. But M. Egede, being zealous for the salvation of the inhabitants, stayed behind, together with his family, and some others who chose to follow his fortunes. In 1733, the Greenland trade was re-affumed with great vigour; and the king granted a pension of two thousand rix dollars a year to the missionaries. In 1736, M. Egede returned to Denmark, after a residence of fifteen years, which he had passed with a pious and fervant spirit; and the king, considering him as a great number of converts.

The Greenlanders of both sexes are short, and under the common fize, but well proportioned. Their faces are somewhat flat; their hair black and lank; and their complexion, from their hard manner of living, and exposure to perpetual cold, is of a brownifh red. It is very seldom that they are afflicted with epidemic diseases, but the fever, to which they are most liable, is of a fpecies peculiar to cold climates. They are timorous and stupid; and neither as is the case with all the dogs peculiar to cold climates. They are live and quick, and of a prodigious fize, falcons, and other birds of prey. They have two sorts of habitation, one of which serves for houses, and the other for winter dwellings. They have two forts of habitation, one of which serves for houses, and the other for winter dwellings.
nals, which feed in large herds, into a narrow defile, where they are easily slain with arrows. Their bow is made of fir-tree, wound about with the twined finew of animals; the firing is composed of the same material; and the arrow is six feet in length, pointed with a bearded iron, or a sharp bone; but those with which they kill birds have no barb, that they may not tear the sea-fowl they kill with lance, with which they throw to a great distance with surprising dexterity. Their canoe, like that used in Nova Zembla and Hudson's bay, is about eighteen feet in length, pointed at both ends, and three quarters of a yard in breadth. It is composed of thin rafts fastened together with the finews of animals. It is covered with dressed sealkins both below and above, in such a manner that only a circular hole is left in the middle, large enough to admit the body of one man. Into this the Greenlander thrusts himself up to the waist, and fastens the skin so tight about him that no water can enter. Thus secured, and armed with a paddle broad at both ends, he will venture out to sea in the most tempestuous weather to catch seals and sea-fowl; and if he is overt, he can easily raise himself by means of his paddle. In this flight vellom they will row themselves sixty or seventy miles in a day; and, as Mr. Pinkerton informs us, they are sometimes wafted as far as the Orkneys.

What is called the ice block, is an amazing congeries of the parts of an integer, one of which is the principal vendor of which is disaffixed at the distance of many leagues. It is laid to extend in magnificent arches for about twenty-four miles. The short summer is remarkably favourable to vegetation; and the northern lights help to diversify the gloom of winter. What is called the frost smoke, burns from cracks in the frozen ocean. The highest mountains on the west side of the Green Sea, and the three principal peaks of which is called the Stag's Horn, are visible from sea at the distance of sixty leagues. Crantz observes that the rocks are full of efts, commonly perpendicular, and seldom wider than half a yard, filled with spar, quartz, talc, and garnets. The rocks are generally vertical, or little inclined, consisting of granite, sandstone, lapis olaris, micaceous schistus, coarble marble, and ferpentine; with asbestos and amianthus, crysals, and black schoar. It is said that fluid of argill has been recently found in Greenland. The lapis olaris is of singular utility in that dark and dimal country, being used for lamps, and culinary utensils. The winter is fierce, that the rocks often bisir and the intensity of the frost + the temperature does not fall in the low days, and at 60° is not four hours beneath the horizon.

GREENLAND, a town of the American States, in Rockingham county, New Hampshire, in the vicinity of the Ocean, five miles southerly from Portsmouth. It was incorporated in 1715, and contains 634 inhabitants. GREENLAND COMPANY. For the encouragement of the whale fishery, a joint stock of forty thousand pounds was, by statute, to be raised by subscribers, who were incorporated: and the company to use the trade of fishing for whales, &c. into and from Greenland, and the Greenland seas: they might make by-laws for their government, and of persons employed in their ships, &c. But by a law, c. 14, any persons who will adventure to Greenland for whale-fishing, shall have all privileges granted to the Greenland company. See the article FISHERY, vol. vii. p. 412.

GREENLAND FISHERY, or WHALE FISHERY. See the article FISHERY, vol. vii. p. 412-419.

GREENE, a town of Scotland, in the county of Berwick; fifteen miles west-south-west of Berwick, and thirty-eight miles from Edinburgh.

GREENE, adv. With a greenish colour. Newly; freshly. Wanly; timidly.—Kate I cannot look green, nor gape out my eloquence; nor have I cunning in profession. Shakespeare. Immaturely; without mature deliberation. Vol. IX. p. 501.

We have done but greenly. In hugger-mugger to inter him. Shakespeare.

GREENNESS, n. The quality of being green; vividness; virulence. In a meadow, the more green and greenness delights, yet the variety of flowers doth heighten and beautify. Ben Jonson. Immaturity; unripeness. This prince, while yet the errors in his nature were excused by the greenness of his youth, which took all the fault upon [ield, loved a private man. Sidney. Freshness; vigour. Take the picture of a man in the greenness and vivacity of his youth, and in the latter date and declension of his drooping years, and you will scarce know it to belong to the same person. South. Newness.

GREENOCK, a seaport town of Scotland, on the river Clyde, with a small fort to defend the harbour; eight miles west of Glasgow, and twenty-nine north of Ayr. Lat. 55° 56. N. Long. 1. 39. W. Edinburgh.

GREEN'SBOROUGH, a post-town, and the chief town of Green county, belonging to the American States, in Georgia: thirty miles from Lexington, and seventy-eight west-by-south from Augusta.

GREEN'SHIRE, a town of the American States, in Caroline county, Maryland; on the west side of Choptank Creek: seven miles north of Dant, and twenty-two south-east-by-south of Chestertown. It is a town of the American States, in Orleans county, Vermont. It adjoins to Mendon on the north-west, and Wheelock on the south-east.

GREEN'SBURGH, a flourishing town of the American States, in Greene county, Georgia: eighty miles west of Augusta, thirty from Washington, and five from the Oconee river, the boundary line between Creek Indians and whites. This town is contiguous to a large quantity of lands which the state has laid off and appropriated for the use of her public university, and which are now in such a state of cultivation, as to afford a handsome revenue for that institution.

GREEN'SBURGH, a post-town, and the capital of Wellmoreland county, in Pennsylvania; belonging to the American States. It is a neat town, situated on a branch of Sewickly Creek, which empties into Youghiogany river. Here are a German Calvinist church, a brick-built court-house, and a stone gaol: thirty-one miles south-east-by-east of Pittsburgh, and two hundred and seventy-west-by-north of Philadelphia.

GREEN'SVILLE, a county of the American States, in Virginia, encompassed by Brunswick, Southampton, and Suffolk counties, on the west, north, and east, and by the state of North Carolina on the south. It is about twenty-four miles long, and twenty broad, and contains, by the census, 6362 inhabitants.

GREENSWARD, or GREEN'SWORD, s. Of the same original with sword. The turf on which groats grow, in shallow soil all is gravel within a few inches; and sometimes in low ground a thin greenward, and sough underneath; which last turns all into bog. Swift.

After break their fast On greenward ground, a cool and grateful taste. Dryden.

GREEN'SVILLE, a county of the American States, in Washington district, South Carolina; situated in the north-west corner of the state; bounded east by Spartanburg county, in Pendleton district, south by Pendleton county, west by the state of Georgia, and that tract of country which the state of South Carolina ceded to the United States; and north, by the state of North Carolina. It contains 6293 inhabitants. The lands are mountainous and hilly, and well watered, and the climate healthy and agreeable.

GREEN'SVILLE, a post-town of the American States,
in South Carolina, and chief town of Cheraws district; situated on the west side of Great Pee Dee river, in Darlington county, about five miles north-east of Camden, ninety north-east-by-east of Columbia, and 135 north-east of Charleston.

GREENVILLE, a post-town, and the chief town of Pitt county, belonging to the American States, in North Carolina, situated on the south bank of Tar river, about six miles north-by-east of Tarborough, ninety-five miles east-north-east of Camden, and 135 north-east of Columbia; contains a court-hous and jail, also a seminary of learning, called the Pitt Academy; twenty-three miles east by north of Washington, and twenty-five miles south of Tarborough.

GREENVILLE, a post-town of the American States, in Greene county, in the state of Tennessee, situated on the Green river, about seventy-five miles east of Knoxville, and 633 south of Jonesborough, twenty-six miles north-west of Johnsonville, seventy-five east of Nashville, and 653 south-west of Philadelphia.

GREENVILLE, a fort and settlement belonging to the American States, in the north-western territory, on the fourth side of a north-western branch of the Mississippi river, thirty miles north-west of Fort Jefferson on the same branch, and about twenty-three miles south-east of Fort Recovery. Here the American legion had their head-quarters in the late war with the Indians. It was established by major-general A. Wayne, in 1793; and here he concluded a treaty of peace with the Indian nations, on the 3d of August, 1795.

GREENWICH, or La Batre, a town and port of entry of the American States, on the east side of the island of Granada. The situation is low, and rather unhealthy.

GREENWICH, a beautiful town in the county of Kent, situated on the margin of the Thames; distant five miles from London. Greenwich, in Saxon Greenwich, signifies the White Town or Dwelling, the last syllable of the word being now, by corruption, written with.

In all deeds and writings it is called Earl Greenwich, to distinguish it from Deptford, which was heretofore called Well Greenwich. It was only a fishing-town, so late as the reign of Henry V. In the safe road which the river here affords for ships, the whole Danish fleet, in the time of king Ethelred, lay their land-locks of for four years successively, whilst the main body of the army was encamped on the hill above the town, called Blackheath. This road is now the chief harbour for the royal yachts. From the ancient camp of the Danes, several places in the parish are still denominated cemeteries, as well as comb, signifying a camp, for they used both the words; the former the Saxon term, the latter Danish, or corrupt Saxon.

Greenwich was the birth-place of queen Mary and queen Elizabeth; and here Edward VI. died. A palace erected here by Humphrey duke of Gloucester, who named it Placentia, on account of its beautiful situation, was enlarged by Henry VII. and completed by Henry VIII. but, being afterward pulled up by rain, was pulled down by Charles II. who began a new edifice, and lived to see the first wing finished. He also enlarged the park, walled it round, planted it, and erected a royal observatory on the top of the hill, called Blackheath. The king allowed five hundred pounds in money towards the building; bricks from Tilbury-fort, where there was a sore dock, and materials were fixed, which was pulled down; promising to grant anything that should be necessary. The foundation was laid Augst 10, 1675; and in the month of August the next year, Flamstead was put in possession of the observatory, which, from him, has acquired the name of Flamstead house. In September he began to make observations with a sextant, and a quadrant, contrived by himself, and such other instruments as were then in use. He resided there many years, doing ample justice to the royal choice; and shewing himself so eminently qualified for his office that, as has very justly been observed, he seemed born for it. Flamstead died at Greenwich, Dec. 31, 1719; and when he was succeeded by Dr. Halley, who was an astronomer of great eminence. Finding, upon his appointment, the observatory so unfurnished with instruments and furniture, he began immediately to furnish it anew, and to fix a transit instrument. A mural quadrant of eight feet radius, constructed under the direction of Graham, was put up at the public expense, in 1725. Dr. Halley's observations were principally directed to the motions of the moon: he died at the observatory in 1742, aged 85, and was succeeded by Dr. Bradley; whose discoveries, already before the public, have justly ranked him among the first astronomers of the present age. In the year 1750, some very valuable additions were made to the instruments at the observatory; a new mural braid's quadrants of eight feet radius, a transit instrument of eight feet length, and a moveable quadrant of forty inches radius, for the observation of the sun and the moon, with a transverse scale of degrees, were added. The observatory has been furnished with an excellent achromatic telescope of forty-six inches focal length, with a treble object-plate, together with a divided achromatic object-plate micrometer, by Dollond; and the whole apparatus has been much improved by Dollond, Nairne, and Arnold. In 1767, his majesty fixed an order that the observations made by the astronomer royal at Greenwich should be published annually, under the inspection of the Royal Society.

The foundation of the observatory owed its origin to the following circumstance: St. Pierre, a Frenchman, who came to London in 1675, having demanded a reward from Charles II. for his discovery of a method of finding the longitude by the moon's distance from a star, a commission was appointed to examine his propositions. Mr. Flamstead, who was appointed one of the commissioners, furnished St. Pierre with certain data of observation by which to calculate the longitude of a given place. This he was unable to do; but excused himself by asserting that the data were false; Mr. Flamstead contended that they were true, but allowed that nothing certain could be deduced from them, for want of more exact tables of the moon, and more correct places of the fixed stars, than Tycho's observations, made with plain sight, afforded. This being made known to the king, he declared that his pilots and sailors should not want such an aid as this; he therefore to found an observatory, for the purpose of ascertaining the motions of the moon, and the places of the fixed stars, as a means of discovering that great de
dicatur, the longitude at sea; and Flamstead, who was recommended to his majesty by sir Jonas Moore, was appointed astronomer royal. Several places were talked of for the site of the observatory; and at last it was determined to fix it near the Royal Hospital, and the Polhemus College at Chelsea, (now the Hospital,) &c. Mr. Flamstead went to see Chelsea College, and approved of it; but sir Christopher Wren having recommended Greenwich Castle, that situation was preferred. The king allowed five hundred pounds in money towards the building; bricks from Tilbury-fort, where there was a sore dock, and materials were fixed, which was pulled down; promising to grant anything that should be necessary. The foundation was laid Augst 10, 1675; and in the month of August the next year, Flamstead was put in possession of the observatory, which, from him, has acquired the name of Flamstead house. In September he began to make observations with a sextant, and a quadrant, contrived by himself, and such other instruments as were then in use. He resided there many years, doing ample justice to the royal choice; and shewing himself so eminently qualified for his office that, as has very justly been observed, he seemed born for it. Flamstead died at Greenwich, Dec. 31, 1719; and when he was succeeded by Dr. Halley, who was an astronomer of great eminence. Finding, upon his appointment, the observatory so unfurnished with instruments and furniture, he began immediately to furnish it anew, and to fix a transit instrument. A mural quadrant of eight feet radius, constructed under the direction of Graham, was put up at the public expense, in 1725. Dr. Halley's observations were principally directed to the motions of the moon: he died at the observatory in 1742, aged 85, and was succeeded by Dr. Bradley; whose discoveries, already before the public, have justly ranked him among the first astronomers of the present age. In the year 1750, some very valuable additions were made to the instruments at the observatory; a new mural braid's quadrants of eight feet radius, a transit instrument of eight feet length, and a moveable quadrant of forty inches radius, for the observation of the sun and the moon, with a transverse scale of degrees, were added. The observatory has been furnished with an excellent achromatic telescope of forty-six inches focal length, with a treble object-plate, together with a divided achromatic object-plate micrometer, by Dollond; and the whole apparatus has been much improved by Dollond, Nairne, and Arnold. In 1767, his majesty fixed an order that the observations made by the astronomer royal at Greenwich should be published annually, under the inspection of the Royal Society.

That which is properly the palace, is an edifice of great extent, and is converted into a residence for the ranger of the park; in which the views from the observatory and the one-tree hill are beautiful beyond description. The formation of these hills is at once so bold, that we look down upon the tops of immense branching trees, which appear to grow in clumps out of deep hollows and inw Illinois, dels.
Jiderable a fum toward this work as he defired. In
the forfeited eftate of the earl of Derwentwater, in 1715,
of God." King William, fenfible of its utility, rea¬
wings, between which is a large arqa, are each terminated
completed with equal magnificence. The front to the
ment to this hofpital. The palace, which conftitutes
amounting to 6000I. per annum, was given by parlia¬
in that and the fucceeding reigns to this noble charity,
with the ranger’s houfe at the back part in the centre,
behind whcih the park rifes with a noble afcent. Thefe
openings among the branches of the trees break upon
that illuftrious warrior and poet Henry earl of Surrey.
To this college belongs a chapel, in which the earl’s
body is laid, which, as well as his monument, was re¬
moved here a few years ago from the chapel of Dover
Castle. In 1560, the celebrated Mr. Lambard built an
church, rebuilt by the commissioners for erecting
ranges of coupled Corinthian columns support their pe¬
diments, and the fame order is continued in pilaffers
along the building. The projection of the entablatures
ives an agreeable diversity of light and shade. In the
centre of each part, between these ranges of Corinthian
columns, is the door, of the Doric order, and adorned
with a tablet and pediment. Within the fmalleft, have ruftic cafes crowned with pediments: the upper feries, which are large and lofty, are adorned
of ancients, and with upright pointed pediments. Over
there is an attic flory; the entablature of the Co¬
columns supports a lafter flory on a plain course; the pilaffer of this order runs over every col¬
umn and pilaffer of the Corinthian below, between
which the windows are regularly difpofed, and the top
is covered with a balufrade. The buildings, which
are continued from thence, and face the area, correspond
with them, though in a more elegant manner. In the
whole, however, has been since rebuilt; and the
chapel was deftroyed, on the 30th of September 1739. The rebuilding of this beautiful flructure,
with its internal decorations, which are in the soft pleating ftyle of elegant felicity, cost eight thou¬
sand pounds. The plan confifts of an architrave,
frize, and cornice of ftatuary marble, the jamb of which are twelve feet high, in one piece, and enriched
with excellent sculpture. The frieze is the work of
Bacon, and confifts of the figures of two angels with
feloons, fupporting the sacred writings. The great
folding-doors are of mahogany, highly enriched, and
the whole composition of this portal is, not, at this time,
to be paralleled in this or perhaps in any other coun¬
try. Within the entrance is a portico of fix fluted
marble columns fifteen feet high. The capitals and
bafes are fionic, after Greek models. The columns fup¬
port the organ-gallery, and are crowned with an enta¬
blature and balufrade enriched with ftatues of ftatuary
marble, by Richter, and their capitals and vafes of ftatu¬
y marble. At the oppofite end of the chapel are
four other fames of the fame fort, which fupport the arched
ceiling and roof. The columns are of the Corinthian
order, and, with their pedefals, are twenty-eight feet
high. Over the lower range of windows are paintings in chiaro ofuuro, reprefeenting fome of the principal
events in the life of our Saviour, which are accompanied
with ornaments of candelabra and feloons. Above
the galleries, on each fide the chapel, is a richly-carved
tone fafcia, on which flands a range of pilaffers of the
Compo{ite order, their shafts being of Scagliola, corre¬
ponding with thofe of the eight great columns, and
jointly with them appearing to fupport the epiftylum,
which furrounds the whole chapel. This epiftylum is
enriched with angels, bearing feloons of oak-leaves,
dolphins, fhefts, and other applicable ornaments. From
this rifes the curved ceiling, which is divided into com¬
diments, and enriched with foliage, grotesques, &c. In
the lower range of windows are paintings in chiaro ofuuro, in which are painted, in chiaro ofuco, the apotel¬
ies and evangelifs. At each end of the galleries are con¬
cave refoles, the covers which are ornamented with cofiers and flowers carved in tone; in these refoles
are the doors of entrance into the galleries, deco¬
rated
ratted with enriched pilasters and entablatures, and a group of ornaments, consisting of the naval crown, wreaths of laurel, and tridents. Above the doors are circular recesses, containing paintings in chiaro oscuro of the prophets Isaiah, Jeremiah, Moses, and David.

The combination-table is a semi-oval slab of veined marble, near eighteen feet long, bearing by six cherubims, standing on a white marble step of the same dimensions. The altar-piece, painted by Weft, represents the preservation of St. Paul from shipwreck on the island of Melita. This much-admired picture is twenty-five feet high, and fourteen wide, and consists of three principal groups, which combine to exhibit a scene calculated to having a proper effect on the minds of sea-faring men, and of informing them with the due sense of their past preservation, and their present comfortable situation and support in this glorious asylum for naval misfortunes and naval worth. On either side the arch, which terminates the top of this picture, are angels of statue marble, as large as life, by Bacon; one bearing the oars, the other the emblems of the eucharist. This excellent combination of the works of art is terminated above in the segment between the great cornice and ceiling by a painting of the Ascension, designed by Weft, and executed by Rebecca, in chiaro oscuro; forming the last of the series of paintings of the Saviour which surround the chapel. The middle of the aisle, and the space round the organ-gallery, are paved with black and white marble, in gothic frets, and other ornaments; having in the centre an anchor and seaman's compass. The pulpit is on a circular plan, supported by six fluted columns of limestone, with an entablature above richly carved, and of the same materials. In the six inter-columns are the following alto-relievo's, taken from the Acts of the Apostles, executed after designs by Weft: The Conversion of St. Paul, Acts, ch. ix. Cornelius's Vision, ch. x. Peter released from Prison by the Angel, ch. xii. Elymas struck blind, ch. xiii. St. Paul preaching at Athens, and converting Dionysus the Areopagite, ch. xvii. Paul pleading before Felix, ch. xxiv. The Nativity: the Angel appearing to the Shepherds; the Flight into Egypt. The second four of the series, painted by De Bruyn, are at the first four of the same side are by Catton, and represent St. John baptizing; Calling of St. Peter and St. Andrew; our Saviour preaching from a Ship to the People on Shore; the Stilling of the Temped. The third four of the series, painted by De Bruyn, are at the east end of the south side of the chapel, and represent the Nativity; the Angel appearing to the Shepherds; the Magi worshipping; the Flight into Egypt. The four which follow on the same side are by Catton, and represent St. John baptizing; Calling of St. Peter and St. Andrew; our Saviour preaching from a Ship to the People on Shore; the Stilling of the Temped. The fourth four of the series, painted by De Bruyn, are at the west end of the north side are by Milbourne, and represent our Saviour walking on the Sea, and saving Peter from sinking; the Blind Man cured by a Touch; Lazarus raised from the Dead; the Transfiguration. The next four on the same side are by Catton, and represent, the Lord's Supper, the Crucifixion; the Resurrection. The Apostles and Evangelists in the recesses between the upper windows, and the four Prophets in the circles above the gallery-doors, are by the last-mentioned artists, after designs of Mr. Weft. On the sides of the gate which opens to these buildings from the park, are placed the Terrestrial, the Celestial, the Sacred, and the Temporal cloths, on which the scars are gilt; and in the centre of the area is a statue of George II.

The hall or saloon of this hospital was painted by Sir James Thornhill. In the centre of the cupola is a compass, with its proper points duly bearing; in the corners are the four winds in alto-relievo. Eurus, the East Wind, sitting out of the east, winged, with a lighted torch in his right hand, as bringing light to the earth; with his left hand he seems to push the morning-star out of the firmament: the demi-figures and boys which form the group flew the morning dews that fall before him. Aufer, the South Wind, with his wings of burning water, is pouring forth rain from a bag, the little boys near him two pairs of thunder and lightning. Zephyrus, the West Wind, accompanied by little Zephrys, with baskets of flowers scattering them around: a figure playing on the flute denotes the pleasure of the spring. Boreas, the North Wind, with dragon's wings denoting his fury: his boisterous companions flinging snow, &c. Sir James Thornhill, when he had finished the ceiling and sides of the great salon, in the year 1717, delivered to the directors a memorial, stating the prices which were given for paintings of the like kind, at the banqueting-houfe, Whitehall, the duke of Montague's, the palace of Windsor, Hampton-court, &c. It appears that the whole of this celebrated work was not completed till 1725, and cost 663l. being after the rate of three pounds per yard for the ceiling, and one pound per yard for the sides. Several eminent painters were consulted by the directors, who reported the performance to be equal to any of the like kind in England, and superior in number of figures and ornaments: but if we may judge from Sir James's manner of working, it is certain that no fees have to exceed that allotted to the hall at Greenwich. Over the three doors are large oval tables, with the names, in gold letters, of such benefactors as have given 100l. or upwards, towards the building: among the most considerable of which were, King William, who gave 19,300l. Queen Anne, 6,472l. John de la Fontaine, esq. 2000l. Robert Oulston, esq. 2000l. Sir John Crople and Mr. Evelyn, each 2200l. John Evelyn, esq. 1000l.

Out of all that is given for swelling the hall, only one-third of the pension is allowed to the person that shews it: the rest makes an excellent fund for the maintenance of not less than twenty poor boys, the sons of slain or disabled mariners; and out of this fund these boys are entirely provided for, and taught such a share of mathematical learning as fits them for the sea-service. For the better support of this hospital, every seaman in the royal navy, and in the service of the merchants, pays sixpence a month. This is flopped out of the pay of all sailors, and delivered in the Sixpenny Receiver's Office, and is the second pay of all seamen who can produce an authentic certificate of his being disabled and rendered unfit for the sea-service by defending any ship belonging to British subjects, or in taking any ship from the enemy, may be admitted into this hospital, and receive the same benefit from it as if he had been in the king's service. There are at present near two thousand old or disabled seamen; and one hundred and forty boys, the sons of seamen, are instructed in navigation, and bred up for the service of the royal navy: but there are no out-pensioners. Each of the mariners has a weekly allowance of seven loaves, weighing fourteen ounces each, three pounds of beef, two of mutton, a pint of pear, a pound and a quarter of salted pork, a quart of beer, and one shilling tobacco-money; the tobacco-money of the boat-swains is two shillings and sixpence a-week each; that of their mates, one shilling and sixpence; and that of the other officers in proportion to their rank: besides which, each common pensioner receives, once in two years, a suit of blue, a hat, three pairs of stockings, two pairs of shoes, twelve yards of black cloth, and other provisions. The markets at Greenwich are on Wednesdays and Saturdays; fairs, Easter-Monday, Tuesday, and Wednesday; and Whit-Monday, Tuesday, and Wednesay, and are generally very numerously attended.

Adjoining to Greenwich-park is Blackheath, where, in 1497, King Henry VII. routed the Cornish rebels. This heath has also been the theatre of many public
exhibitions, as it was formerly not unusual for the illustrious personages who visited this island to have here their first interview with the English monarch. In particular, Mafia, son of Honor of Constantinople, who in 1414 came over to require aid against the Turks, was splendidly received upon this spot by Henry IV. and, here, in 1416, king Henry V. is reported to have met the emperor Sigismund, and to have conducted him with magnificence to London.

In 1789, a curious cavern was discovered, on the left side of the ascent to Blackheath, in the road to Dover. It consists of seven large rooms, from twelve to thirty-six feet wide each way, which have a communication with each other by arched avenues. Some of the apartments have large conical domes upwards of thirty-five feet wide each way, which have a communication at the entrance; at the extremities, one hundred and sixty feet; and it is defended by a regular flight of steps. The sides and roof are rocks of chalk; the bottom is a fine dry sand; and, upwards of one hundred and seventy feet under ground, is a well of remarkably fine water, twenty-seven feet deep.

The bottom of the cavern is at least fifty feet from the surface of the earth at the entrance; at the extremities, one hundred and sixty feet; and it is defended by a regular flight of steps. The sides and roof are rocks of chalk; the bottom is a fine dry sand; and, upwards of one hundred and seventy feet under ground, is a well of remarkably fine water, twenty-seven feet deep.

It consists of seven large rooms, from twelve to thirty-six feet wide each way, which have a communication at the entrance; at the extremities, one hundred and sixty feet; and it is defended by a regular flight of steps. The sides and roof are rocks of chalk; the bottom is a fine dry sand; and, upwards of one hundred and seventy feet under ground, is a well of remarkably fine water, twenty-seven feet deep.

The principal entrance is decorated with Doric columns, festoons, and a pediment on the top, over which rises a tower, with a flight of circular steps; and, having passed through this part of the building, we enter an inner square, surrounded with piazzas. The chapel is neatly wainscotted, and has a cloisters altarpiece. This structure sir John endowed, after his lady's decease, with his whole estate, and the income from it was paid to her. He placed in this hospitable twelve decayed Turkey merchants in his life-time; but lady Morden, finding that the share allotted her by sir John's will was insufficient for her maintenance, was obliged to reduce the number to four. Upon her death, the whole estate coming to the college, the number was increased, and there are at this time thirty-five poor gentlemen; and, from the same cause, a hospital was erected in Greenwich-park, this place is now made the meridian of longitude by moxt English navigators.

GREENWICH, a township of the American States, in Hampshire county, Massachusetts, incorporated in 1724, containing 1045 inhabitants: twenty miles easterly of Northampton, and seventy-five miles of the Hudson.

GREENWICH, a township of the American States, in Essex county, New Jersey, the mouth of the river by which it is fifty miles north-easterly of Easton, in Pennsylvania, and thirty-one south-west of Newton, the shire town.

GREENWICH, a town of the American States, in Cumberland county, New Jersey, on the north-west bank of Cohanzoy creek, about three miles from its mouth in Delaware river; it is fifteen miles south-west of Salem, and sixty-six south-west of Philadelphia.

GREENWICH, a maritime township of the American States, in Fairfield county, Connecticut, and the south-westernmost of the state, lies about fifty miles west of New Haven, and forty east of New York city. Its sea coast on Long Island Sound, and that of the township of Stamford on the eastward, has a number of jetties and rocks bordering the inlets of Long Island Sound, and mouths of the creeks. Byram river passes through this town, the largest of the small streams which water it, and only noticeable as forming part of the line between Connecticut and New York. This track was purchased of the native Indians in 1649, and settled under the government of the New Netherlands, (now New York,) and was incorporated by Peter Stuyvefant in 1665, who was then governor of the New Netherlands. This town falling within the bounds of Connecticut, was afterwards granted to eight persons by that colony.

GREENWICH, in Rhode Island; see EAST GREENWICH, vol. vi. p. 218.

GREENWOOD, a wood considered as it appears in the spring or summer.

GREENWOOD, adj. [from the f. / Belonging to a green wood.—Among wild herbs under the greenwood shade. Fairfax. It happen'd on a summer's holiday,

That to the greenwood shade he took his way. Dryden.

GREENWOOD, a township of the American States, in Cumberland county, Pennsylvania. Also, a township in Mifflin county in the same state.

GREENWOOD, a vast forest of lofty pines, in Litchfield county, Connecticut, which cover the face of a great part of that county. These are clothed in green bearded mats, which being pendant from the boughs, screen many of the trees from the eye, and gives to the whole a gloomy, wild, and romantic, appearance.

GREENS, a river of Ireland, which runs into the Barrow, six miles south of Athy, in the county of Kil-
I think if men, which in these places live,
Durst look in themselves, and themselves retrieve,
That they would like strangers, greet themselves. Donne.

To address in whatever manner:

Now, Thomas Mowbray, do I turn to thee,
And mark my greeting well; for what I speak,
My body shall make good. Shakespeare.

To salute in kindness or respect.—My lord, the mayor
of London comes to greet you. Shakespeare.

The sea's our own: and now all nations greet,
With bending knees, each vessel of our fleet. Waller.

To congratulate:

His lady, seeing all that channel from far,
Approach in haste to greet his victory. Spenser.

To addres in whatever manner:

To greet, To salute in kindness or respect.
To greet, To congratulate: To pay compliments at a distance:
His lady, seeing all that channel from far,
Approach in haste to greet his victory. Spenser.

The king's a-bed,
And sent great largesses to your officers;
This diamond he greets your wife withal,
By the name of most kind hosts. Shakespeare.

To meet, as those do who go to pay congratulations:
Your haste is now urg'd on you. Pope.

We will greet the time. Shakespeare.

To greet, u. t. To meet and salute:
Such was that face on which I dwelt with joy;
Are Greece assembled Stem'd the tides to Troy;
But parting then for that detested shore,
Our eyes, unhappy! never greeted more. Pope.

Tell me, good Hobbinoll, what gots thee greet. Spenser's April.

He who greets.

Salutation at meeting, or compliments at a distance:
I from him
Give you all greetings, that a king, as friend,
Can fend his brother. Shakespeare.

Others written greeze; see greeze, or grieze, or griece; from degree. A flight of feet; a step.

A town of Germany, in the
archduchy of Austria, situated on the Danube: six miles north-west of Kloster Neuberg.

Belonging to a flock.

Going in flocks or herds, like sheep or partridges.—No birds of prey are gregarious. Ray.

Myrtus. See Greg'gia, f. in botany. See Myrtus.

Gregoire, or Gregoue, a small island of Africa, in the river Jaquin, about a league from the sea, on the Gold Coast, where the European nations have factories.

[Gregorian, f. [at one time a cant word for] a pervig. He cannot be a cuckold, that wears a Gregorian; for a pervig cannot fit such a head. Overbury.

Gregorian Calendar, or the common Almanac, so called from pope Gregory XIII. being the new or reformed calendar, /hewing the new and full moons, with the time of Easter, and the other moveable feasts depending upon it, by means of epacts disposed through the several months of the Gregorian year.

Gregorian Epoch, the epoch or time from which the Gregorian calendar, or computation, took place. This began in the year 1582; so that the year 1582 is the 246th of this epoch.

Gregorian Telescope, a particular sort of telescope, invented by Mr. James Gregory. See Telescope.

Gregorian Year, the new style, introduced upon the reformation of the calendar, by pope Gregory XIII. in the year 1582, and from whom it took its name. See the article Chronology, vol. iv, p. 353.
polated in others, that it is impossible to ascertain what part of them was, and what part was not, written by this pope. With respect to the Commentaries on the Song of Solomon, which have been frequently ascribed to him, all the best critics concur in giving them to other authors. Numerous have been the impressions of Gregory's works, separately and collectively, at Lyons, Paris, Rouen, Bafli, Antwerp, Venice, and Rome. The last and best edition was published at Paris in 1705, in 4 vols. folio, by father St. Mark, general of the Benedictines of the congregation of St. Maur.

GREGORY II. (pope), and also a saint in the Roman calendar, was a native of Rome, and educated from childhood in the Lateran palace, under pope Sergius, who appointed him his sub-deacon, almoner, and librarian. It was under the supremacy of this pontiff that the emperor Leo, surnamed the Isaurian, issued his famous edict, forbidding the worship of images; which tended to curtail the dominions of the pope, andoccasioned the total separation of the Greek and Latin churches. He died in the beginning of the year 731. Seventeen of his Letters, and a Memoir transmitted to his legates in Bavaria, containing instructions for their guidance in managing the ecclesiastical affairs of that country, are inserted in the sixth volume of the Collectio Conciliorum, and his Liturgy, with a Greek version by Gregory Codinus, was printed by Morel at Paris, in 1595, and is to be found in the second volume of Fronton du Duc's Antiquarian.

GREGORY III. (pope), was a Syrian by birth, and became a prebendary of the Roman church. He is said to have been eminently learned for his time; skilful as an expositor of Scripture, and much admired as an eloquent and impressive preacher. He died in the year 795, after a pontificate of between ten and eleven years. Seven Letters of his are extant in the fourth volume of the Collect. Concil.

GREGORY IV. (pope), was born at Rome, and from a prebendary of that church was raised to the episcopate on the death of pope Valentine, in 827. He is commended for his extraordinary piety; of which some of the fonnest testimonies are his repairing and adorning churches, and instituting the festival of All Souls day. He died in 844, after prefiguring over the Roman church rather more than sixteen years. Three of his Letters are extant in the seventh volume of the Collect. Concil.

GREGORY V. (pope), whose original name was Balduinus, a German by birth, and cousin to the emperor Otto III. He died in the begining of a pontificate of two years and five months. Four of his Letters are extant in the ninth volume of the Collect. Concil. A fifth, concerning the privileges of the abbots of Mons Major, may be found in the fourth volume of Balduinus' Miscellaneous.

GREGORY VII. (pope), who by his abilities and intrepidity raised the Roman see to the highest pitch of power, was the son of a carpenter, born at the small town of Soano, in Tuscany. As to his literary productions, three hundred and fifty-nine of his Letters have reached our time, which are divided into nine books, and inserted in the tenth volume of the Collect. Concil. He is also generally supposed to have been the author of A Commentary upon the Seven Penitential Psalms, which some writers have improperly ascribed to Gregory the Great; and of A Commentary on the Gospel of St. Matthew, which is said to be preserved in manuscript in the archiepiscopal library at Lambeth.

GREGORY VIII. (pope), originally known by the name of Albert de Mora, born at Benevento, and created cardinal by pope Adrian IV. in the year 1155. He died, after a pontificate of not quite two months. He is praised for his learning, eloquence, humane disposition, and exemplary manners. Three of his Letters are extant in the tenth volume of the Collect. Concil.

GREGORY IX. (pope), celebrated for preaching up the virtue of engaging in the crusades. He presided over the Roman church nearly fifteen years. Many of his Letters are to be found in the eleventh volume of the Collect. Concil. and Waddingus' Annal. Minor. ad ann. 1228, &c. Some fragments of his Decretal Letters are inserted in the five books of Decretals, collected under his inspection by Raymond de Penafort, which were ordered by Gregory to be alone read in the schools, and quoted on trials.

GREGORY X. (pope), descended from the illustrious family of Viticosti, and born at Placentia. He is highly spoken of for his extraordinary sanctity, and appears to have been influenced by a milder spirit than many of his predecessors. Several of his Letters are extant in the eleventh volume of the Collect. Concil. and Waddingus' Annal. Minor. ad ann. 1272, &c.

GREGORY XI. (pope), a native of France, and on the cout de Beautoit. He died in 1278, after a pontificate of seven years and three months. He is highly praised for his piety, humanity, and general excellence of character; and is also commended as a generous patron of men of letters. The greatest part of the Letters of this pope have been published by Waddingus, in his Annal. Minor. ad ann. 1372.

GREGORY XII. (pope), was originally called Angius Corario, and descended from an ancient and noble family at Venice. He died at Recanati in the fourth year of his pontificate. He was about ninety-two years of age. Some of his Letters are extant in the eleventh and twelfth volumes of the Collect. Concil. and Waddingus' Annal. Minor. ad ann. 1406, &c.

GREGORY XIII. (pope), born at Bologna, in 1502. When, in the year 1573, intelligence arrived at Rome of the preparation of the protestant confederacy, and the king from the protestant confederacy! And he certainly gave a function to the horrible measure, by solemnly publishing a jubilee over all Christendom; among other reasons, on account of the great blow which had been given to the heretics. But the most important event in his pontificate took place in 1582, namely, the reformation of the calendar, according to a method suggested by Louis Lilio, a Calabrian astronomer, which after being prorogued at Rome by his brother Antony. It was immediately received in all catholic countries; but was rejected by the protestants, and by the Greeks, who chose rather to continue in error than to be set right by the pope; and it was not admitted in this country before the year 1752. At present the Russians and the Greeks are the only Europeans who oppose its reception. He was a great friend to the Jesuits, to whom he granted many privileges, and built for their use, and richly endowed, the Roman college, and no fewer than twenty-seven other seminaries in different parts of the world. He patronized the grand Roman edition of the Decretals, and several of his Letters, Haranges, &c. are still preserved in the cabinets of the curious. He died in the fourteenth year of his pontificate, aged eighty-four years.

GREGORY XV. (pope), descendend from a noble family at Bologna, and born in 1554. He instituted the famous college De propaganda Fide, and endowed it with ample revenues for the maintenance of persons educating foreign millions, and for foreign missions. He died, in 1623, in the seventeenth year of his age, having filled the papal see two years and six months. He is commended for his great piety and learning, and for his charity to the sick and to the poor.
poor. He was the author of Schak Abbas, cum Notis Hegalfoni, 1627, 8vo, and The Decisions of the Rota. He was a great friend to the Je-fuits, and canonized Ignatius their founder, Francis Xavier, and by him the fee of Paris was withdrawn from subjection to that of Sens, and constituted an archbisphope.

GREGORY of NEO-Cæsarea, usually styled saint, and furnamed Thaumaturgus, or Wonder-worker, from Thaumaturgus and furnamed Theodoras. His father, who was a zealot for paganifm, took care to have him educated in his own religious principles, at the time that he was initiated in the elements of useful and ornamental learning. For five years, at least, Gregory and his brother were the disciplices of Origen, who instructed them in logic, physics, geometry, arthro¬mony, and ethics. He encouraged them, likewise, in reading all sorts of ancient authors, poets, and philo¬phers, refraining from none but such as denied a Deity or a Providence; and during this period he made them from time to time extracts to the Christian faith, informing them of an intimate acquaintance with the sacred Scrip¬tures, and explaining to them obscure and difficult pas¬sages. He was present at the first council of Antioch in 264, when the cafe of Paul of Samofata was the sub¬ject of enquiry; and concurred with Firmilian, and the other leading members, in preventing any harth mea¬sures from being adopted against him. It is most prob¬able that he did not long survive the meeting of this council; and that he died in the year 265. The only works of his extant, which may be pronounced unquestionably genuine, are, his Panegyrical Oration in Praife of Origen; A Paraphrase on the Book of Ecclelaeates; and, A Canonical Epifile, confiding of eleven canons, of which the last is rejected by the abfeft critics as fpu¬rious. The pieces above-mentioned have been separa¬tely printed, in Greek and Latin, at different periods, and also collectively in one volume folio, at Paris, in 1626. Gerard Voifius also published an edition of them at Mentz, in 1604, in quarto.

GREGORY (Nazianzen, saint), flourished in the fourth century, being born at a village near Nazianzum, in Cappadocia, in 324. He was first placed at Cæsarea in Cappadocia, whence he afterwards removed to Cæ¬sarea in Phalaen, where he studied under some of the moft celebrated masters of that age. After a life spent in various religious controversies, and in travelling for the acquisition of knowledge and improvement, on his re¬turn to the country in which he was strongly in¬stru¬ced, he undertook the charge of the fee of Nazianzum, which had continued vacant from the time of his fa¬ther's death; but no entreaties could prevail upon him to quit his patrimonial estate near Nazianzum, where he died in 389, when about sixty-five years of age. He was in many respects a great and a good man, and an or¬monstous figure to the age in which he lived. His benevolence and charity were boundless, and led him to devote al¬moft the whole of his income to the relief of the poor and afflicted. He was one of the moft able champions in defence of the orthodox doctrine of the Trinity, whence he obtained among the catholics the title of O Or切hiop, or, the Divine, by way of distinction; but excepting in the infinaces of the Apollinarids, against whom he excited the enmity of his successor Nectarius, and his inveCtives against Julian, he can scarcely be said to have transgressed the laws of candour and moder¬ation towards those who differed from him in opinion. He polished great quickfins of apprehenfion, clearness of judgment, vivacity of imagination, brilliancy of wit, and ease and readiness of elocution. His learning was profound, and entitled him to the character of be¬ing the best scholar of his age. Mofi, if not all, of the works of this father are full extant, and have undergone a variety of impreffions, in collective and separate forms. They consist of Orations or Sermons, Letters, and Poems; first published together at Bafl, in 1550, in Greek; but the best edition of them is that published by Frederic Morel, in 2 vols. folio, 1609, at Paris, in Greek and Latin.

GREGORY (furnamed Nyssen, saint), was a younger brother of St. Bafl, and born in Capâdocia, about the year 322. He enjoyed the advantages of a liberal education, and distinguffed himself by his pro¬ficiency in literature and ficence, particularly excelling in the rhetorical art, which he practifed for some time as a professor and pleader, with great succefs and ap¬plauze. Through the persuasion of Gregory Nazianzen he was induced to relinquish his secular pursuits, and to apply with great diligence to the study of theology and of the Scriptures. Having taken orders, he be¬came as eminent in the pulpit as he had been formerly at the bar; and, in 372, he was ordained bishop of Nyfla, in Capâdocia, by his brother Bafl. He was pre¬sent at the council which met at Conffantinopol in 368, where the learned and talents of a man so highly ad¬mirable were displayed, and his advice followed in many of their most important determinations. To him they confided the talk of drawing up a creed explanatory of the Nicene, which was adopted, and is the fame that has been received into the English liturgy, under the name of the Nicene Creed, excepting the words 44 the Son," in the article relating to the Holy Ghod, which were added at a later period. His name appears in the lifs of the prelates who were present at the synod held at Conflantinopol in 324. How long he lived after this date cannot be ascertained with any exactness. He is highly extolled for the extent of his learning, the quick¬nels of his parts, the perenafiveness of his eloquence, and the piety and fazuity of his life. His works were of fift of Commentaries on different parts of Scripture; do¬gmatical and controverfal Treatifes; Sermons and Funeral Orations; Lives and Panegyrics of distinguished Characters; Letters, &c. The beet edition of them was published at Paris in 1615, in 2 vols. folio, which was followed by an Appendix in 1618, in Greek and Latin, with the version and notes of St. Matthew and under the superintendence of Claude Morel. This edition was reprinted in 1638, in 3 vols. folio, but with lefs neatness and correctness than that of 1615.

GREGORY (George-Florence, commonly known by the name of GREGORY of TOURS), a saint in the Roman calendar, and, notwithstanding all his faults, the article relating to the Holy Ghod, which were added at a later period. His name appears in the lifs of the prelates who were present at the synod held at Conflantinopol in 324. How long he lived after this date cannot be ascertained with any exactness. He is highly extolled for the extent of his learning, the quick¬nels of his parts, the perenafiveness of his eloquence, and the piety and fazuity of his life. His works were of fift of Commentaries on different parts of Scripture; do¬gmatical and controverfal Treatifes; Sermons and Funeral Orations; Lives and Panegyrics of distinguished Characters; Letters, &c. The beet edition of them was published at Paris in 1615, in 2 vols. folio, which was followed by an Appendix in 1618, in Greek and Latin, with the version and notes of St. Matthew and under the superintendence of Claude Morel. This edition was reprinted in 1638, in 3 vols. folio, but with lefs neatness and correctness than that of 1615.

GREGORY (George-Florence, commonly known by the name of GREGORY [i.e. of Tours], a saint in the Roman calendar, and, notwithstanding all his faults, the article relating to the Holy Ghod, which were added at a later period. His name appears in the lifs of the prelates who were present at the synod held at Conflantinopol in 324. How long he lived after this date cannot be ascertained with any exactness. He is highly extolled for the extent of his learning, the quick¬nels of his parts, the perenafiveness of his eloquence, and the piety and fazuity of his life. His works were of fift of Commentaries on different parts of Scripture; do¬gmatical and controverfal Treatifes; Sermons and Funeral Orations; Lives and Panegyrics of distinguished Characters; Letters, &c. The beet edition of them was published at Paris in 1615, in 2 vols. folio, which was followed by an Appendix in 1618, in Greek and Latin, with the version and notes of St. Matthew and under the superintendence of Claude Morel. This edition was reprinted in 1638, in 3 vols. folio, but with lefs neatness and correctness than that of 1615.

When he had become a proficient in the learning of the times, he was admitted to deacon's orders, and acquired considerable reputation by his talents as a preacher. Being attacked by a dangerous illness, he paid a reli¬gious vifit to the tomb of St. Martin at Tours, which impreffion made in his favour, that on the death of Euphro¬nus bishop of Tours, in 573, he was unanimously elected his successor. He is spoken of as having secured the respect and esteem of all ranks, by the fide¬lity and diligence with which he discharged his epif¬copal duties. In 594 he took a journey to Rome, to visit the tombs of the apoiles, and to pay his respects to pope Gregory the Great, who received him with the highest marks of esteem. He died soon after his return to his diocife, in 595, in the fifty-second year of his age.
Gregory (James), one of the most eminent mathematicians of the seventeenth century, the son of the Rev. Mr. Gregory, minister of Drumoak, in Scotland, and born at Aberdeen, in 1638. His mother was the daughter of Mr. David Anderson of Finzaugh, a gentleman who poisseld a singular turn for mathemati¬cal and mechanical knowledge. This great genius was hereditary in the family of the Andersons, and from that seems to have been transmitted to their descendants of the name of Gregory. The mother of James Gregory inherited the genius of her family; and, observing in her son a strong propensity to mathematics, she instructed him herself in the elements of that science. He received his education in the languages at the grammar-school of Aberdeen, and went through his usual course of academical studies in the Marischal college, with credit to his application and proficiency; but his greatest pleasure was in philosophical researches, into which a new door had lately been opened by the key of the mathematicians. Galileo, Kepler, Des Cartes, &c., were the great masters of this new method; their works, therefore, became the principal study of young Gregory, who soon began to make improvements upon their discoveries in optics. In 1653, when only twenty-four years of age, he published his Operic Promota, seu additis Radiorum Reflexorum & Refellatorum mysteris, Geometricae candidae, &c., 410. This work, which announced the invention of the reflecting telescope, immediately attracted the notice of mathematicians, both at home and abroad, who were soon convinced of its great importance to the sciences of optics and astronomy. See the article Telescope. After coming to London, Mr. Gregory was refol ved to make the tour of Italy, which was then esteemed the mart of mathematical learning. As the university of Padua was at that time in high reputation, he fixed his residence there for five years; and in 1667, published at that place, Vera Circuli & Hyperbola Quadratura, &c., 410. In this work he announced another of his discoveries, that of an infinitely converging series for the areas of the circle and hyperbola, by which they may be computed to any degree of exactness. He sent home a copy of this work to his friend Mr. Collins, who communicated it to the Royal Society, where it met with the commendation of lord Broun¬ker and Dr. Wallis. In 1668 he reprinted that tract at Venice, with an answer to such objections as either had been, or such as he conceived might be, made against it. This answer was inserted in the preface to another piece, amended the former, and entitled Geome tricae Partis Universalis, invennis Quadratura Curvarum Translaciones & Mefhuras, 410, in which he is allowed to have shewn, for the first time, a method for the transmuta tion of curves. These works engaged the notice, and
and procured the author the correspondence, of the most eminent mathematicians of the age, Newton, Huygens, Halley, Wallis, and others. An account of the piece last mentioned was also read by Mr. Collins before the Royal Society, of which our author, upon his return from his travels, was immediately elected a member; after which he communicated to that body an account of the controversy carried on in Italy concerning the motion of the earth, which was denied by Riccioli and his followers; and he also enriched the Philosophical Transactions by the contribution of other excellent papers.

In 1668, Lord Brounker having produced his Series for Squaring the Hyperbola, a demonstration of it was soon afterwards given by Mr. Mercator, in the Logarithmo-technia. These papers induced Mr. Gregory, before the end of the same year, to publish his Exercitationes Geometrica, 4to, in which he improved and enlarged Mercator's discovery, and gave a geometrical demonstration of it by means of supposing the lemniscates of a circular arch. In this treatise, like all the following, he first demonstrated the meridian line to be analogous to a scale of logarithmic tangents of the half complements of latitude, and extended his method of infinite series to the mensuration of some mechanical curves, as the conchoid and cissoid of the ancients. About this time he wrote a dissertation of the properties of his own bolt of latitude, and extended his method of infinite series to suited his uncle's examples, left by him without any demonstration, but discovered others, by which an infinite number of curve lines, and the areas contained between them and right straight lines, might be measured. For this purpose he improved the excellence of the Newtonian philosophy, and was the first who had the merit of introducing it into the schools, by his public lectures at Edinburgh. He continued to fill the mathematical chair at Edinburgh with great applause till the year 1698, when, on hearing a report of Dr. Bernard's intention of resigning the Savilian professorship at Oxford, he went to London. There he was introduced to Sir Isaac Newton, who soon conceived a high opinion of his abilities, and recommended him to the Royal Society, of which he was chosen a member. Newton also introduced him to the acquaintance of Mr. Flamsteed, the astronomer-royal, who concurred in furthering the design on which he had come into England, and their recommendation he went to Oxford, where, in the year last mentioned, he was incorporated in the degree of M. A. and accumulated the title of physic; soon after which he was elected to the vacant chair of Savilian professor of astronomy, though Mr. afterwards Dr. Halley was a competitor. Their rivalship, however, instead of injuring the utility, laid the foundation of friendship between these eminent men; and Halley afterwards became the colleague of Gregory, by obtaining the professorship of geometry in the same university. In 1693 Dr. Gregory published, in the Philosophical Transactions, a resolution of the Florentine enigmatical problem de secta tangenti cellarum quadratae; and afterwards communicated to the public the same channel several ingenious and mathematical papers. In 1695 he published at Oxford, Catoptrica & Dioptrica Sphaerica Elementa, 8vo, which contains the substance of some of his public lectures, read eleven years before at Edinburgh.

In 1677, Dr. Gregory was the first who gave to the public the design of explaining Sir Isaac Newton's geometry of the centripetal forces, as far as his discoveries in astronomy and

GREGORY. 8vo.—the Exercitationes Geometricae of the same author, 1684, 4to. or his ingenious piece upon Pradlica

---

The Great and New Art of Weighing Vanity ; or, a Discovery of the Ignorance and Arrogance of the Great and New Art, 8vo. In this the astronomer-royal, who concurred in furthering the design, wrote against Mr. Boyle, and behaved ill towards a colleague of Gregory. During the same year, our author partook in the universal astonishment which struck the learned world upon the first news of Newton's discovery of the nature of light; and though he readily yielded to the experimental evidence on which that great man's theory was founded, but as in consequence of these discoveries, Newton had contrived a new reflecting telescope, and made several objections to Mr. Gregory's, this circumstance gave rise to a controversy between these two philosophers, which was carried on in the most amicable manner on both sides. In the course of this dispute, Mr. Gregory suggested the first idea of a burning concave mirror, which was approved by Newton, and afterwards came into common use among philosophical experimenters. Several of the letters that passed in this controversy were published by Dr. Deranglies, in an appendix to the English edition of Dr. David Gregory's Elements of Catoptrics and Dioptrics. In 1674, Mr. Gregory was called to Edinburgh, to fill the mathematical chair in that university. This place he had held for little more than a year, when, in October, 1675, being employed in viewing the satellites of Jupiter through a telescope to some of his pupils, he was suddenly struck with total blindness, and died a few days afterwards, at the early age of thirty-seven.

Such of Mr. Gregory's inventions as are not contained in his works already enumerated, are the subjects of several letters and papers printed either in the Philosophical Transactions, or the Commercium Epistolarium, 1715, 8vo.—the appendix to Dr. Deranglies's English edition of Dr. David Gregory's Elements of Optics.
mony are built upon it, and to throw the astronomical part of his Principia into a new and more intelligible form. The author's merit in it received the most distinguished notice from the particular approbation given to it by the ablest men himself, who communicated to Dr. Gregory his thoughts on the subject, as he had improved it to so much exactness, as to be able to correct it by Mr. Flamsteed's best observations. It was afterwards translated into English, of which the second edition appeared in 1726, in two volumes octavo, entitled, The Elements of Physical and Geometrical Astronomy, by David Gregory, 20c., to which is annexed Dr. Halley's Synopsis of the Astronomy of Comets. The whole newly revised, &c. by Edmund Stone, F. R. S. In the year 1703 Dr. Gregory published his splendid folio edition of The Works of Euclid, in Greek and Latin; an undertaking which had been begun by his predecessor Dr. Bernard, in compliance with the wishes of Savile, who left it in charge to the two professors on his foundation to print the works of all the ancient mathematicians. The next work to which Dr. Gregory devoted his attention, in compliance with Mr. Savile's injunction, was to prepare, con­jointly with Dr. Halley, a new edition of Apollonius Con­ics, which was not proceeded in his undertakings before he was cut off by death, in 1710, when only in the forty-ninth year of his age. To his genius and abilities the most celebrated mathematicians of the age, Newton, Halley, and Keill, have given ample testimonies. Besides the works already mentioned, two posthumous pieces of his made their appearance: one, A treatise on the Nature and Arithmetic of Logarithms, which was printed at the end of Dr. Keill's translation of Commandine's Euclid; and the other, A Treatise of Practical Geometry, which was translated and published in 1745, by Mr. Maclaurin, in 8vo. He also left behind him several manuscripts till inedited, and among others, A Commentary on Newton's Principia, which that great man is reported to have valued, and to have kept by him for many years after the author's death.

JAMES GREGORY, the brother of the preceding, and the second son of Mr. David Gregory of Kinnairdie, inherited the genius of his family, and rose to eminence in his time as a mathematician. Upon Dr. David Gregory's death, the Chryslerhip of mathematics was left in his charge, and in 1706 was succeeded by his son David Gregory, who proceeded in his undertakings as his father had done, and in 1727 was removed to Edinburgh; and upon the resignation of Dr. Rutherford, in 1766, was elected to the chair of physic in that university. He was now placed in a situation where his abilities could be justly appreciated and adequately rewarded. His two preliminary lectures, On the Duties and Offices of a Physician, and on the Method of prosecuting Enquiries in Philosophy, were published in 1769, in a separate volume, and were universally admired for the elegance of their style and the spirit of benevolence which they breathed. After lecturing some years in his proper branch, he made an agreement with Dr. Cullen for alternately interchanging the lec­tureship on the theory and on the practice of physic; by which arrangement the students had the benefit of the whole medical system of both these eminent professors. In 1772 he published, Elements of the Practice of Physic, being an enlarged syllabus of his lectures. This volume, however, terminated with the febrile dif­eases. He did not long survive; for having gone to bed in apparent health, on February 9, 1773, he was found dead in the morning without the least discom­­posure of feature or limb. In the next year, a piece which he had composed soon after the death of his wife was published, under the title of, A Father's Legacy to his Daughters, 12mo. It contains several heads of advice for the conduct of young females, on all of which are given many valuable and judicious observations, displaying much knowledge of the world. All the works of Dr. Gregory were published together in four volumes 8vo. 1788.

GREGORY'S SOUND, a narrow strait of the sea, between the islands of Arranmore and Inismain, on the west coast of Ireland.

GREGSTOWN, a town of the American States, in Somerset county, New Jersey, on the east side of Millstone river, six miles north-easterly of Princeton, and nine south-west of New Brunswick.

GRIFFENBERG, a town of Silesia, in the principality of Lauer: eight miles south-west of Loewenberg; and fourteen north of Hirschberg.

GRIFFENBERG, a town of Germany, in the circle of Upper Saxon, and Ucker Mark of Brandenburg: four miles north of New Gernburg.

GRIFFENBERG, a town of Germany, in the circle of Upper Saxon, in Hinder Pomerania: six miles north-north-west of Plate, and fifteen north of Neugarten. Lat. 53° 53'. N. Long. 32° 55'. E. Ferro.

GRIFFENSEE, a lake of Switzerland, in the canton of Zurich, on a lake of the same name; burned, in 1444, by the confederates, who put the garrison to the fire: five miles east of Zurich.

GRIFFENSEE, a lake of Switzerland, in the canton of Zurich: five miles east of Zurich.

GRIFFENSTEIN, a town and castle of Silesia,
in the principality of Jauer: two miles south of Greifenberg.

GRIFFENSTEIN, a town of Germany, in the circle of the Upper Rhine, and principality of Solms-Braunfels; seven miles north-west of Braunfels, and thirty-four north of Mentz. Lat. 50. 31. N. lon. 26. E. Ferro.

GREIFSWALD, or GRIFFENSTEIN, a see-port town of Germany, in the circle of Upper Saxony, and Swedish Pomerania, situated on the river Rig, which is navigable to the Baltic, with an university, founded in the year 1456 by Wratiflaus IX. fifteen miles south-east of Stralund. Lat. 54. 4. N. lon. 31. 17. E. Ferro.

GREILLENSTAIN, a town of Germany, in the archduchy of Austria: one mile west of Horn.

GREIN, a town of Germany, in the archduchy of Austria, situated on the north side of the Danube: fourteen miles west of Linz, and sixty-two west of Vienna. Lat. 48. 16. N. lon. 42. 39. E. Ferro.

GREITZ, or GRAZITZ, or GREWITZ, a town of Germany, in the circle of Upper Saxony, in the Vogtland, with some fluff manufactures, situated on a small river which runs into the Elber. It contains about 450 houses: ten miles west of Plauen, and twelve south-west of Zwickau.

GREKSAKER, a town of Sweden, in the province of Weftmanland: forty-eight miles west of Stroemholm.

GREENLAND, adj. [gregorum, Lat.] Pertaining to the lap.

GREENSEA, one of the smaller Orkney Islands, between Pamina and Hoy.

GRENAO, or GRANADA, sometimes called Upper Andalusia, a province of Spain, bounded on the north by New Castile, on the east by Murcia, on the south by the Mediterranean, and on the west by Andalusia, about 130 miles in length, and from twenty to ninety in breadth. As this country lies opposite to Africa, and the coast is made smooth by the ravages of time, a great number of towers and forts are erected along the coasts. This province is one of the most healthy and most temperate in Spain; and as fertile, as scarcely to stand in need of human industry and culture; rivers, brooks, and springs, are innumerable. When in the possession of the Moors, it was one of the most populous and rich countries in the world; at present it is not so. However, generally speaking, the land produces corn, wine, oil, sugar, flax, and hemp. The mountains and the plains produce great variety of excellent fruit, as pomegranates, citrons, oranges, olives, capers, figs, almonds, mulberry-trees grow in abundance, by which means great quantities of wine are produced. In the forests are collected gall-nuts, of use in the preparation of leather, and dyeing in general. The beams of the country, besides being used for cattle, are of so delicate a taste, as to be preferred to fillets; the raimes are of two kinds, namely, those dried by the sun on the branches, called paferifidas del sol, and the others, called paferifidas de tinta, are dipped in hay made with the ashes of the burnt branches, and afterwards dried in the sun. Honey and wax are abundant. In the mountains, near Antequera, a great deal of excellent salt is made, not by fire, but by the heat of the sun, which is sufficient for the evaporation of the moisture. In several places are quarries of excellent stone for buildings, and in some places hyacinths, and other precious stones, are found.

The inhabitants of the country, though greatly degenerated from the industry and vigilance of their forefathers, are still the most laborious in the southern parts of Spain. They are fond of commerce and agriculture; they are of mild and polished manners, and so sober, that they drink but little wine themselves, and never give any to their children. This province first became a distinct kingdom in the thirteenth century, when the Moorish king Alphonse, who reigned at Cordova, having, in 1236, left his life and crown in a battle against the Christians, his subjects and followers betook themselves to Grenada, and chose a new king, who made this city his place of residence. This kingdom, which was the last of the Moorish, then contained thirty-three large towns, and ninety-seven smaller, and continued from the year 1236 to 1492, when Ferdinand the Catholic reduced it, and annexed it to the crown of Castile. Grenada is the capital. The principal rivers are the Xeni and the Guadalentin.

GRENAO, a city of Spain, and capital of the above-mentioned province, is said to have been founded 2800 years before Christ. It is situated at the foot of the Sierra Nevada, or Snowy Mountains, on two hills, which are separated by a river called Darro, which soon after joins the Xenti, that passes by the walls of the town. It is divided into four quarters, of which the principal bears the name of Grenada, and is inhabited by the nobility, clergy, and the richest of the citizens, with many public and private buildings. In this part is the cathedral, not remarkable for its extent, but for its beautiful dome; several of the Castilian kings and queens lie buried in this church. The second quarter is that of Alhambra, which is inhabited by descendants from the ancient Moors. Here are two palaces, one of which was built by Ferdinand I. in 1240, by the Moors, and the others, called dilford, those dried passerasillas, and the others, called dilford, or black pepper.

GRENZ, or GRENZENBURG, a mountain of Germany, in the circle of Lower Austria, and the principality of Solms. Lat. 47. 12. N. lon. 15. 0. E. Ferro.

GRENSO, or GRENSESO, a mountain of Germany, in the circle of Upper Sаксony, in the Vogtland, with some fluff manufactures, situated on a small river which runs into the Elber. It contains about 450 houses: ten miles west of Plauen, and twelve south-west of Zwickau.

GRENOBLE, a town of France, on the river Isere, which runs into the Rhone. It contains about 450 houses: with some fluff manufactures, situated on a final! river ten miles; north-north-east of Plauen, and twelve south-west of Zwickau.

GREOPE, or GREOPE, a mountain of Germany, in the circle of Lower Austria, and the principality of Solms. Lat. 47. 12. N. lon. 15. 0. E. Ferro.

GREOPES, a mountain of Germany, in the circle of Upper Sаксony, in the Vogtland, with some fluff manufactures, situated on a small river which runs into the Elber. It contains about 450 houses: ten miles west of Plauen, and twelve south-west of Zwickau.

GREPOLE, or GREPOLE, a mouth of France, on the river Isere, which runs into the Rhone. It contains about 450 houses: with some fluff manufactures, situated on a final! river ten miles; north-north-east of Plauen, and twelve south-west of Zwickau.

GREPOPOLE, or GREPOPOLE, a mountain of Germany, in the circle of Lower Austria, and the principality of Solms. Lat. 47. 12. N. lon. 15. 0. E. Ferro.

GRENADA, one of the Caribbee islands, in the West Indies, about twenty-eight miles from north to south, and thirteen wide in the centre, but gradually narrowing towards each extremity, hence it is very nearly of the figure and size of the Isle of Wight. It was discovered by Christopher Columbus, in 1498. A chain of lofty hills creases it from north to south, in the centre of which is a large lake, from which several rivers take their rise. Near the coast the soil is good, and produces indigo, sugar, tobacco, coffee, cocoa, and cotton; game is also abundant. Among the birds, the most common are turtle-doves and paroquets. The chief river fish are cels, mullets, and cray-fish. Ten chains of lofty hills creases it from north to south, and the centre, which is narrow towards the north, eight to the west, and five to the south-east, all sufficient to drive sugar-mills, and capable of becoming harbours for vessels. The principal harbours are Port Louis, and St. George. In 1653, the French attempted
to form a settlement here, under an appearance of purchas-
ing land from the native Caribs. Diffputes soon arose be-
tween the Indians and the new comers, which ended in the de-
struction of the former, and the ruin of the new colony. M. Pariquet, who Medbafia through the little valley, told it to Jean de Cec-
villac, at Paris, with all the vessels, arms, &c. for 90,000 livres, or 90,000 crowns. The count sent such a tyrannical brute to govern it, that the better fort
abandoned the island, and the right who played behind,
after feizing him, shot him dead. Nevertheless, in 1664,
the count told this island to the French West-India com-
pany for 100,000 livres, though only one hundred and
fifty planters were left, out of five hundred that were
upon the island when they took possifion of it; and, in
1674, the company was obliged to give it up into the
hands of the king.

In 1714, things began to improve in Grenada. Vessels
from Martinico, in failing to the Spanish coast, touched
at Grenada in their way, to take in provisions. The
trading privators, who undertook this navigation, taught the people of that island the value of their soil, which only required cultivation. The execution of every project is facilitated by commerce. Some traders fur-
nurished plants with favours to the natives to induce them to
fugar plantations. An open account was established between the two colonies. Grenada was clearing its
adlivity and eagernefs induftry could inspire. The
peace of 1748 revived all the labours, and opened all
the activity of the island. The revolt originated with the
lieutenant-governor, and feveral of the moft respeCtable characters,
by the garrifon on the camp of the infurgents, fifty Bri-
tish people on the island was more than sixteen hun-
dred; in 1757, they were feventeen hundred; and in 1793, hardly one thou-
fand. In 1787, the exports were, 1,027,548 cwt. of fugar,
818,700 gallons of rum, 1,027,166 pounds of cof-
t, 425,719 pounds of chocolate, 91,943 pounds of cot-
t, and 27,768 pounds of indigo. In 1779, Grenada
was taken by the French, and reforted to the English by the
peace of 1783. In the year 1771, the number of white people on the island was more than sixteen hundred;
in 1777 they were lefs than thirteen hundred; and in 1793, hardly one thousand. In 1787, the exports were,
1,027,548 cwt. of fugar, 818,700 gallons of rum,
818,700 gallons of rum, 1,027,166 pounds of cof-
t, 425,719 pounds of chocolate, 91,943 pounds of cot-
t, and 27,768 pounds of indigo, besides miscellaneous articles to the value of 64,542l. sterling, amounting, in the whole, to upwards of 600,000l. fter-
ing, at the London prices.

Just as the island was thus rapidly advancing to com-
plete prosperitY, a fatal furreftion, almost as fan
gulinarY as that which took place at Hifpaniola, blighted
the fair hopes of the planters, and defolated the whole
island. The revolt originated with the free people of
colour, an intermediate class, generated between the
whites and the blacks, the offspring of licentious indul-
gence, who were permitted to wander about the coun-
try in vicious idlenefs, a burthen to themfelves, and a
weight upon the natives; but who had been the inferor,
by the threcry of Fedon and his adherents, were delibe-
rately maffacred by order of that inhuman monster! They all met their fate with fortitude and refignation.

Taking advantage of this savage furreftion, the French privators, in December following, difpatched an armament, and took poffifion of the island. But in the month of June 1796, it was retaken by the Bri-
tish under the renowned general Abercrombie. Lat.
12° 10' N. lon. 61° 30' W. Greenwich.

GRENADA, a town of Nicaragua, and audience of
Guatimala, in South America, situated on the Lake of
Nicaragua, by which means it has a communication with

Vol. IX. No. 362. 

He was allowed to enjoy all the privileges of a British sub-
ject in their fullest extent: but we are told that, in
matters of capacity, he was, to the lafl degree, de-
based and ignorant. Perhaps on that account he was
thought a proper perfon to be appointed commandant-
general in such a fortified place, where the French
military were reforted to his standard. The night of the 2d
of March 1795 was appointed for the execution of the plot.
Accordingly, the small towns called Greenville, or La
Barré, and Charlotte-town, were feized nearly at the fame
hour by different parties. At the former, the free peo-
ple of colour surrounded the houses about midnight,
an, as the inhabitants looked out of their windows to
inquire into the caufe of the furreftions, they were
immediately shot. The revolters at length entered
into the chambers of the devoted victims, and, dragging
them into the streets, fet them up as marks to be shot at; and
afterwards mangled the dead bodies in a manner too bhock-
ing to be related. They spared neither sex nor age.

At Charlotte-town, the infurgents acted with lefs cru-
ely. The women and children were fpared, and per-
nitted to remain at a plantation about a mile from the
town; but the men who were made privators, were fent
to the rebel camp.

The British commander in chief, lieutenant-governor
Home, was unfortunately at a confiderable distance
from St. George's, when the news of the revolt was
conveyed to him. Conceiving that his presence was
immediately neceffary at the seat of government, he
determined to proceed thither by sea, and embarked in a
vessel with fome other gentlemen, at a place called St.
Patrick's Bay. On coming off Charlotte-town, which
was in poftifion of the rebels, the fort fired at the
vessel; and a veflel, which was thought to be a French
privater, appearing at the fame instant to be making
 fabrics with the maffacre, the governor and every perfon on-board,
except the maff, came to the fatal determination of
go ing aho re the bo at, and truding to the mercy of the
enemy. The maffer remained on-board, and, after
his little veflel out of the reach of the privater's guns,
got safely to St. George's. The governor and his party
were surrounded on landing by the rebels, who forth-
with conveyed them to their camp at Belvidere, and
confined them in the fame building with thofe who had
been taken privators at Charlotte-town.

The capture of the lieutenant-governor was a fatal
circumstance: moft of the French white inhabitants,
notwithfanding that they had fware allegiance to the
British government, and had lived under its protefion
upwards of thirty years, now openly declared for the
infurgents, and repaired to their camp. The negroes,
mighty in their example of their masters, fcarfed the
island, except the town of St. George, and a few plan-
tations in its neighbourhood, foon fell into the poftifion of the
rebels; and the work of plunder, with the de-
vaftation by fire, became almost general. Our limits
will not allow us to enter into a detail of the fubfe-
quent events and military operations; yet we cannot
pass unnoticed the miferable fate of lieutenant governor
Home, and his companions. Early in the attack made
by the garrifon on the camp of the infurgents, fifty Bri-
tish infurgents, among whom were the lieutenant-go-
vernor, and feveral of the moft repectable characters,
who had been captured, or induced to furrender, by
the threcry of Fedon and his adherents, were delibe-
rately maffacred by order of that inhuman monster! They all met their fate with fortitude and refignation.
the Pacific Ocean and the Caribbean Sea. Its commerce is considerable in indigo, cochineal, hides, and sugar. In 1663, it was taken and burnt by the English and French freebooters: fifty miles south-south-east of Leon. Lom. 69. W. 40.

GRENADA (New), a province of South America, in the Spanish government of Terra Firma, and called the New Kingdom of Grenada; bounded on the north by the provinces of St. Matthew and Venezuela, on the south-east by Guiana, on the south by countries unknown, and on the west by the provinces of Carthagena and Popayan; first discovered in 1526. Ferdinand de Lugo, admiral of the Canaries, sent Gonzalo Ximenes de Quefada, his lieutenant, from St. Martha, to discover the country situated along the river Magdalena. Ximenes travelled by land along the left bank of that river, but with great difficulties, on account of the thick woods and vast number of rivers, rapid streams, and marshes, he had to cross; but principally on account of the frequent inroads of the natives. He came to a place named Tora, which he called Puebla de los Brachas, on account of four rivers that joined there. At this place he passed the winter, having travelled, as he reckoned, 150 leagues from the sea-coast up the land. Next spring, he went up another river; and he came to a high mountain called Opoon, fifty leagues broad, very steep and defert: having passed the, he came into an even plain country, very cultivated, where they gathered a great deal of salt from certain salt springs. Thence he came with his people into the province of a powerful cacique, Bogota, whom they defeated. They afterwards plundered the villages of the Indians, where they found stores of gold and emeralds. Thence they went into the country of the Panchos, separated from that of Bogota by little hills, and entered into a valley which they called the Trumpet, fifteen leagues distant from a very high mountain, bare of trees, and from which the Indians got emeralds. While they stood in that valley, they took an immense booty and abundance of gold. Three days journey farther, they subdued two other caciques: and being returned into the province of Bogota, they passed through the country of the Panchos, and obliged the greater number to make peace.

Ximenes, judging that this country was now sufficiently discovered and inhabited, called it the New Kingdom of Grenada, because he was a native of the province bearing that name in Old Spain, and built the city of Santa Fé, which is the capital. The natives use maize, or the callava-root, instead of bread. They have plenty of salt, which they fell to great profit in the neighbouring countries, particularly th'o'fe fituated in the mountains, along the river Magdalena. They have plenty of game; the lakes and rivers abound with fish. The natives are tall, and wear black, white, or variegated, capes, which they tie round the waist with a belt. They adorn their heads with strings of painted flowers, very ingeniously made of cotton. The country abounds with gold and silver mines, and produces plenty of corn and cotton; and the inhabitants breed a number of horses and mules, which they send to Peru.

GRENA D A (Louis de), a Spanish dominican monk, born in the city whence he derived his surname, in 1504. He was educated in the family of the marquis de Mondejar, and afterwards embracing the ecclesiastical life, acquired a high character for fainthood and virtue, and was chosen to fill the most honourable posts in his order. He was also much admired for his pulpit talents, and was held in high consideration by the Kings of Portugal and Castile. He uniformly refused all the offers of ecclesiastical prelacy which were made to him, and devoted his days to the affairs of the church. He was the author of the composition of pious and devotional treatises. St. Charles Borromeo and St. Francis de Sales held his writings in high esteem; and pope Gregory XIII. under whose pontificate they were com-
The distance from the Mississippi to the Illinois across the country, is lessened or increased, according to the windings of the former river; the smallest distance is Cape au Gres, and there it is between four and five miles. The lands in this intermediate space between the above two rivers are rich, almost beyond parallel, covered with large oaks, walnut, &c. and not a stone to be seen, except upon the sides of the river.

GRESHAM, Sir Thomas, was an eminent and patriotic merchant of the city of London; the younger son of Sir Richard Gresham, also a merchant, and lord-mayor of London, who was descended from a good family in Norfolk. Thomas was born at London in 1519, and received an academical education at Gonville-hall, in Cambridge; but being designed to follow the commercial life of the family, he joined his uncle Sir John Gresham, and was admitted into the mercers' company in 1543. He soon after married, and during his father's life pursued his mercantile employments with great diligence. He was disappointed in his expectation of becoming his father's successor in the agency of the King's money-affairs at Antwerp; but the person who had obtained the preference having, by mismanagement, brought them into a bad condition, Gresham was sent over in 1552, by the regency in the minority of Edward VI., in order to retrieve them. He so ably conducted these business that, in about two years he paid off the whole of a loan bearing enormous interest, raised on London's credit, and at a rate of twenty per cent., the rack. At the accession of Elizabeth he was for a time deprived of his office, but it was restored to him, and he held it, together with that of quen's merchant, as long as he lived. He also received from her the honour of knighthood. He was of great use in the pecuniary negotiations of that reign, and was likewise a spirited promoter of the infant manufactures of the kingdom. The property he inherited, with that of his own acquisition, made him the richest subject[1] in the metropolis, and he displayed his wealth in the most liberal manner. Having lost his only son in 1564, he diverted his grief by public undertakings. His influence, together with a letter he had written to the merchants of his own country; and though the company of merchant-adventurers at first refused the requested loan, yet his influence, together with a letter in a somewhat menacing style from the privy-council, induced several of the moneyed men to join in a small one, which may be considered as the commencement of the new advances since made to the crown from the same body.

The literary education Gresham had received probably imprised him with a notion of the value of learning different from that commonly entertained by men of business; and it appeared to him worthy of his patriotic spirit to found an institution for the education of young men for the sciences in his native city. The University of Cambridge, with its liberal- than by, is to be hoped, now prevails in that femininity, endeavoured to diffuse him from thus establishing a rival institution; but his determination was fixed. He devised by will his fortune in Bishoptgate-street (for the pious and pious being converted to habitations and lecture-rooms for seven professors or lecturers on the seven liberal sciences, who were each to receive a salary out of the revenues of the Royal Exchange. With respect to the founder, it is an undoubted proof of his inefficiency to learning and mental improvement, a due degree of which it may be presumed he did not think fit to bestow on the new character.

From the History of Gresham Professors, by Mr. Ward, it appears that many eminent men have been of the number, though they now hold the office chiefly as a sinecure. The places are continued, with a double salary, as a compensation for the loss of the apartments by the conversion of Gresham-college into the modern general Excise-office. The lectures are now (if at all) given in the Royal Exchange.

The favourite villa of Sir Thomas was at Ottery-stark, near Brentford, upon which he expended a great sum; at the same time not forgetting to consult profit as well as pleasure, in which view, among his edifices were built, of leather, blue and white, upon the pressure of the Brent. In the possession of general respect and esteem, he died suddenly in November 1579, at the age of sixty.

GRESHOLT, a small island of Denmark, in the Skagerrack: four miles north-east from the island of Lolland.

UOSS, f.[gezle, old Fr] Straps of leather tied about the legs of hawks, by which they are held on the fit. Otherwise called Jess:

Soar ye ne'er so high, I have the greffa that will pull you down.

Marlow's Edward II.

GRESHEN, a town of Samogitia: twenty miles north-north-east of Mednik.

GRESSET (John Baptift Louis), an elegant French poet, born at Amiens in 1709. He entered at the age of sixteen among the Jesuits; and from that retreat purified the public by the production of some poems, of which he professed all the excellence and delicate pleasure that could have been expected in a man of the world. These were his Ver-Vert, a charming tale; and his pleasing epistles de La Chartreufe, Les Ombres, Epitre au Père Bougeant, and others. The reputation they obtained was the cause of his quitting the society in his twenty-sixth year, and fixing in the metropolis. He then tried his powers in dramatic composition, and wrote the tragedy of Eduard, which had little success. His Siécle, a comedy of the grave and romantic kind, was better received; but it was his Méchant, represented in 1747, which raised him to the first rank of writers in this class. Its success was prodigious, and it has ever been regarded as a masterpiece in that species of comedy which paints manners with truth and force, without being highly dramatic. Greslet was admitted into the French Academy in 1748. In 1775, he had the honour, as director of the academy, to compliment Louis XVI. and his queen, on their accession to the throne. His discourse upon this occasion, which was printed, was a severe satire on the vices and follies of the metropolis. He received from the court letters of nobility and the order of St. Michael, and was appointed historiographer of the order of St. Lazare. He did not long survive his honours, dying in June 1777, in consequence of an accbuse in his breast.
GRETP, a river of England, which runs into the Lake, about two miles south from Kirby Lomdale, in Westmorland.

GRETNA GREEN, a celebrated village of Scotland, in the county of Dumfries: whither minors of England generally resort to be married, as out of the jurisdiction of the marriage act: eight miles north of Carlisle.

GRETSEER (James), a learned German Jesuit, born at Maredorf, in 1560. He entered into the order when he was seventeen years of age, and, applying with great affiduity to his studies, became a considerable proficient in the ancient and modern languages, philosophy, theology, and ecclesiastical and profane antiquities. He filled successively the chairs of philosophy, morals, and divinity, during twenty-five years, in the university of Ingolstadt, and died there in 1635, when sixty-four years of age. He spent a considerable part of his life in writing against protestant authors, and in defence of the order to which he belonged. The ablest of his controversial pieces are those intended to refute the answers of Whitaker, Tunins, Dancan, and other protestants, to Bellarminum, which form a collection in two volumes folio, printed at Ingolstadt, in 1599 and 1600. He also wrote a great number of tracts on profane and ecclesiastical antiquities, one of the most celebrated of which is a learned but dull and dull work De Cruce, in 3 vols. 40. He was well versed in the Greek tongue, and published some grammatical pieces in that language, together with notes on some Greek authors. All his works, original and translations, amounting to one hundred and fifty-three in number, were printed at Rotterdam in 1739, in seventeen volumes folio.

GRET'SYHHL, or GRETHNE, or GROETZ, a town of Germany, in the circle of Welfphalia, on the coast of Esth Prussia; ten miles north-north-west of Emden.

GREW, f. (Gersfa, or rather Greve, Sax.) A word of power and authority, signifying as much as comes or vicecomes; and hence comes our firces, portreeve, &c., which by the Saxons were written Sægresfa, portgerfa. Lambert, in his Explication of Saxon Words, terfe Frateteus, makes it the same with rece. See HARDW. Part. vol. iii. p. 316.

GREVE AL LANCHAN, a bay on the north-west coast of the island of Jersey.

GREVE DE LECQ, a bay on the north coast of the island of Jersey.

GREVEN, a town of Germany, in the circle of Welfphalia, and bishopric of Munster; eight miles north of Munster.

GREVEN, f. A coin in Muscovy, in value one florin.

GREVENBROICH, a town of Germany, in the circle of Welfphalia, and duchy of Juliers; ten miles north-north-east of Juliers. Lat. 51. 6. N. lon. 24. 4. E.

GREVENSTEIN, a town of Germany, in the circle of the Lower Rhine, and duchy of Welfphalia: sixteen miles west of Brilon.

GREVERAD, a town of Germany, in the circle of Welfphalia, and duchy of Berg: one mile north-west of Solingen.

GREVILLE (Fulke), lord Brooke, distinguished for his literary talents, was the descendant of an ancient family settled at Beauchamp's-court, in Warwickshire, where he was born in 1554. He was educated at both universities, but chiefly at Trinity college, Cambridge, and afterwards added to his academic acquisitions the ornamental accomplishments of a gentleman, in a course of foreign travel. He was early introduced to the court of queen Elizabeth, where he was much admired, and attracted the notice of her royal mind, that is to become a particular favourite. She showed her regard in a manner not very pleasing to one of his gallant spirit, by restraining him from taking part in some martial enterprizes abroad on which he was bent. For his disobedience in some instances, he was punished by interdicting him of banishment from court. His favour during this reign procured him little advancement, and he chiefly through the interest of sir Henry Sidney that he obtained two lucrative posts in the court of the marches of Wales. For these he was probably indebted to his friendship with sir Henry's illustrious son, sir Philip Sidney, which was so intimate, that on his heroic death in the Low-countries, he presented to Fulke Greville a moiety of his books. In 1597 he received from the queen the honour of knighthood, and two years after, the office of treasurer of marine causes. He sat in several parliaments during this period as knight of the shire for the county of Warwick.

At the accession of James, he was created a knight of the Bath, and soon after had the grant of the castle of Warwick. Other valuable grants were made him; but it was not till a later period of the reign that he rose to any poet in the state. In 1614 he was made under-treasurer and chancellor of the exchequer, and admitted into the privy-council; and was also a gentleman of the bed-chamber. His interest raised him, in 1620, to the patent by the title of Lord Brooke of Beauchamp's-court. He was continued in the privy-council by Charles I. but of his political character we have little information. He had long distinguished himself as a patron of letters; and in 1627 he testified his gratitude to his alma mater, by founding at Cambridge a history of literature, with a handsome salary to the professor. His long and profligate life was terminated in a tragical manner, in 1628. One of his domestics, a man named Haywood, who had faithfully served him many years, finding himself likely to be frustrated of his expected reward, entered into a warm expletution on the subject, when alone with him in his chamber. Lord Brooke received a feverish reprimand, which threw the servant into such a paroxysm of rage, that he gave his master a mortal stab in the back, and then, locking him up in his room, put an end to his own life with the same weapon. His lordship was interred at Warwick, and upon his tomb the following epitaph was placed, by his own direction: "Fulke Greville, servant to queen Elizabeth, counsellor to king James, and friend to sir Philip Sidney."

Though Greville was known to be a writer in prose and verse during his life-time, yet few of his compositions were made public till after his death. In 1632 the following poetical works appeared under his name: 1. A Treatise of Human Learning, one hundred and fifty stanzas. 2. An Invention upon Fame and Honour, eighty-six stanzas. 3. A Treatise of War, sixty-eight stanzas. 4. The Tragedy of Alaham, one hundred and nine sonnets, mostly on the topic of love. To these may be added his poetical remains, consisting of A Treatise of Monarchy, and A Treatise of Religion. Of his prose writings, the most interesting is the Life of the great object of his admiration, sir Philip Sidney. His style in all his works is affected and involved, full of metaphor and digression, yet displying a full mind and a large acquaintance with various learning.

GREVIL'LERS, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the district of Bapaume; half a league west of Bapaume.

GREUSS'EN, a town of Germany, in the circle of Upper Saxony, and county of Schwarzburg: eighteen miles east of Muhlhausen, and sixteenth north of Erfurt. Lat. 51. 6. N. lon. 28. 31. E. Ferro.

GREW, f. With miners, the earth which contains, or is contained in, that is, a porsis of iron ore with its great; that is, a congeries of crysals, or spark of fire, of the bigness of bayleaf, and of a brown shining color impermed therein.
GREW, the preterite of grow.

The pleasing task he fails not to renew;
Soft and more soft at ev'ry touch it grew.

Dryden.

GREW (Nehemiah), an eminent physician, born at Coventry, in which city his father, Obadiah Grew, D.D. was vicar of St. Michael's church. He was brought up in the presbyterian faction, his father having taken the covenant; and upon the change of things at the restoration, he was sent to study in a foreign university, where he took the degree of doctor of physic. He settled first at Coventry; but in 1672, he removed to London. Having made himself known as an ingenious enquirer into nature, he was chosen a fellow of the Royal Society in 1672, on the recommendation of bishop Wilkins. Thereafter, in 1677, appointed him their secretary, in which capacity he published the Philosophical Transactions from Jan. 1677-8 to Feb. 1678-9. The college of physicians admitted him an honorary fellow in 1680. He obtained considerable practice, and was much esteemed, as well for his piety as his philosophical knowledge. He died in 1711. Dr. Grew's first publication was entitled, The Anatomy of Vegetables, begun 1671, 12mo. It was followed by an Idea of a Phytological History of Roots, 1673; and The Anatomy of Trunks, 1675. These separate pieces constituted the three first books of the great work, The Anatomy of Plants, with an Idea of a Phytological History of Plants, 1676, folio, with many plates. This is a truly excellent performance, replete with curious considerations concerning the intimate structure of vegetables and their parts, in the examination of which he diligently employed microscopes and other helps. He also wrote A Catalogue and Description of the Natural and Artificial Rarities belonging to the Royal Society; to which is added, the Comparative Anatomy of Stomachs and Guts, begun 1684, folio. This last, which was the substance of papers read before the Royal Society, contains much valuable description of the primæ visæ, as existing in a great number of animals. A Latin treatise on Epifom and other purging salts, 1695, and some papers in the Philosophical Transactions, complete his professional works. He concluded his labours with a book designed to serve the cause of religion, entitled, Cosmographia Sacra, or a Discourse of the Universe, as it is the Creature and Kingdom of God, 1701, folio.

In this he not only supports the doctrines of theism, but argues in favour of the Jewish and Christian revelations. He mentions the influence of vital philosophy in nature, distinct from a body, which, as well as Cudworth's platic form, has been charged by Bayle as the admittance of an unconscionable principle of action, similar to that of the atheists; but Le Clerc endeavours very rationally to free them from this unnatural consequence.

GREWESMÜHLEN, or GREWESMUEHLER, A TOWN OF GERMANY, IN THE CIRCLE OF LOWER SAXONY, AND DUCHY OF MECKLENBURG: FOURTEEN MILES WEST OF WIMAR.

GREWIA, f. [so named by Linnaeus, in honour of Nehemiah Grew, M.D. F.R.S. the famous author of the Anatomy of Vegetables.] IN Botany, a genus of the class gynandra, order polyanthera, but removed by Schreber to the magnoliacea, order polyanthera, class gynandra, order of colurnifera, (tiliaceae, Jaff.) The generic characters are—

Calyx: perianthium five-leaved; petals lanceolate, upright, leathery, coloured within, spreading, deciduous.
Corolla: petals five, the same form with the calyx, often smaller, emarginate at the base; nectary, a scale beneath the base of the petal, thin, bent in, inclined to a rim surrounding the style. Stamens very numerous, the length of the petals, bifoliate, inserted into the base of the germ; anther with a roundish, pifilloin: germ pedicellated, roundish, fitting on a columnar upright receptacle, surrounded by a two-crenurated rim; style filiform, the length of the flowers; stigma oblong, four-cleft. Pericarpium: berry with a nectarous scale at the base of each; berry four-celled.

Species. 1. Grewia occidentalis, or elm-leaved grewia: leaves subovate, flowers solitary. This will grow to the height of ten or twelve feet, and has a stem and branches very like those of the small-leaved elm, the bark being smooth, and of the same colour as that of elm when young; the leaves are also very like those of the elm, and fall off in winter: the flowers are produced singly along the young branches from the axils, and are of a bright purple colour; they appear towards the end of July, and continue through August to the beginning of September, but are never succeeded by fruit in this country. They appear from Plukenet that it was cultivated in 1692 in the royal garden at Hampton Court.

2. Grewia populifolia, or poplar-leaved grewia: leaves orbiculate, peduncles solitary, one-flowered. This is a branching shrub; the branches slender, smooth, ash-coloured; leaves petioled, alternate, scattered, unequally and bluntly tooth-crenate, veined, very smooth above, scarcely pubescent beneath; hair filicate, visible only with a magnifier. Allied to the foregoing, but of a looser habit, with the leaves hanging down like those of Populus tremula, having filicate hairs beneath; the flowers are a little smaller.

3. Grewia orientalis, or orient grewia: leaves sub-lanceolate, flowers solitary. Allied to the first sort. It is a native of the East Indies, and flowers in July and August.

4. Grewia lavigata, or smooth grewia: leaves elliptic, acuminate, smooth on both sides, quite entire at the base, peduncles three-flowered. Branches with a purple bark dotted with white; leaves from two to three inches long. It differs from the next in having longer leaves, quite entire, and without glans at the base, and three-flowered long peduncles. It is a native of the East Indies, where it was observed by Koenig.

5. Grewia glandulosa, or glandular grewia: leaves ovate-lanceolate, acuminate, smooth on both sides, glandular at the base; flowers solitary, subelliptical. Native of the Isle of France.

7. Grewia excelsa, or tall grewia: leaves oblong, becoming tomentose, hoary.

8. Grewia Afratica, or Aftatic grewia: leaves cordate-roundish, smooth on both sides, peduncles shorter than the petiole. Branches smooth, with a brown bark very minutely dotted with ash-colour; leaves a hand breadth and more. Native of the East Indies.

9. Grewia malococca, or South-sea grewia: leaves cordate-roundish, smooth on both sides, peduncles shorter than the petiole. Branches smooth, with a brown bark very minutely dotted with ash-colour; leaves a hand breadth and more. Native of the East Indies.

10. Grewia malococca, or South-sea grewia: leaves cordate-roundish, smooth on both sides, peduncles shorter than the petiole. Branches smooth, with a brown bark very minutely dotted with ash-colour; leaves a hand breadth and more. Native of the East Indies, where it was observed by Koenig.

11. Grewia velutina, or velvet grewia: leaves cordate-roundish, smooth on both sides, peduncles shorter than the petiole. Branches smooth, with a brown bark very minutely dotted with ash-colour; leaves a hand breadth and more. Native of the East Indies. Native of the IJlands of Tongataboo and Huaheine in the South Seas.
fot on both sides, hoary underneath; peduncles axillary, about three together, three-flowered. Stem thrabby. All parts of the plant very fot with sap. Flowers smaller than in G. Ahtatica.

12. Grewia falvifolia, or sage-leaved grewia; leaves oblong, quite entire; flowers axillary, several pedicelled; petals bowed back, linear. A shrub. Native of the East Indies.

Propagation and Culture. The common grewia may be propagated from cuttings or layers; the cuttings should be taken off, and planted in April, before the buds fwell, for they do not succed well after; these cuttings should be planted in small pots filled with loamy earth, and the pots should be plunged into a moderate hot-bed of tanners bark, where, if they are duly watered, and in the heat of the day shaded from the sun, they will take good root in about two months, and may then be gradually inured to the open air, into which they should be removed in June, and placed in a sheltered situation, where they may remain till autumn, when they must be removed into the green-house; the best time to lay down the layers of this plant is in the spring, before the buds come out, and these will be rooted by the middle of October; the best time for cutting the plants is the following year, when they may be cut off from the old plants, and planted each into a separate pot filled with a soft loamy soil. The best time to remove or transplant this plant is, either in the spring, just before the buds begin to fwell, or in autumn, when the leaves begin to drop; for in summer, when the plants are in full leaf, it will be improper to disturb them. In winter these plants should be placed in the green-house, for they are too tender to live abroad in England; but they should have as much free air as possible in mild weather; for they only require to be protected from frost, and after their leaves are fallen they will require very moderate watering; but in summer they should be constantly watered three or four times a week in dry weather, and placed in a sheltered situation, with other hardy green-house plants, where they will add to the variety. The other sorts, being tender, will not live through the winter in England, unless they are placed in a warm fove; nor do those plants which are placed on shelves in the dry fove; therefore the only method to have them succeed, is to place them in the bark-bed in the tan-fove. In summer these plants require a good share of free air to be admitted to them, and should have water three or four times a week in warm weather; but in winter they must be sparingly watered, and require to be kept warm. They will require, 3yrz. Fr. more properly written gray. 

See Gray. 

Our green youth copies what gray fanners act, 
When venerable age commends the fect. 

Dryden. 

GREY, f. in zoology, a badger. Scott. 

GREY (lady Jane), the innocent and amiable victim of unprincipled ambition, was the daughter of Henry Grey marquis of Dorset, by Frances Brandon, daughter of Charles Brandon duke of Suffolk, and Mary, queen dowager of France, and sister of our Henry VIII. Her birth is placed in 1537. From her early years she exhibited a quickness of parts that has rendered her one of the prodigies of her fex and age. Besides the accomplishments of needle-work, fair handwriting, and music, she possessed such a knowledge of the learned languages as would be surprizing in the most promising scholar of the other fex. The learned Alcham has recorded, that on paying her a visit in her fourteenth year at her father's seat in Leicestershire, he found her reading the Phaedon of Plato, while the family were hunting. She was then under the tuition of Mr. Aylmer, (afterwards bishop of London,) to whose kind and gentle treatment, which was a contrast to the severity of her parents, she attributed the delight she took in study. She was able at this time even to write Greek with facility, and she is said also to have acquired not only the French and Italian languages, but the Hebrew, Chaldee, and Arabic. Her readiness of apprehension, her solidity of judgment was equal to her readiness of apprehension, and she dis- couraged upon the most important topics with excellent felicity. With all these endowments of understanding, she possessed the modesty and gentleness becoming her fex. She imbibed from her tutor the principles of the reformation, to which she remained unalterably attached.

Dudley duke of Northumberland, while young king Edward VI's declining health alarmed him with the prospect of an approaching change, meditated the securing of his authority by a project so lefs daring than criminal. Trusting in Edward's zeal for the protestant religion, he ventured to propofe to him the uninterzal and arbitrary act of setting afide both his filters from the fucceflion, and bequeathing his crown to lady Jane Grey, though her mother, in whom the right reigned, was then living. He had previously procured a marriage, in May, 1553, between this lady and his own fourth fon, lord Guilford Dudley, an amiable youth, who had not gained his youth, and the event altering the fucceflion was speedily drawn up, and Edward died on July 6th of the fame year. On July 10th lady Jane's father, then duke of Suffolk, accompanied by the duke of Northumberland, repaired to Durham-house, where the young couple reafed, and paying homage on his knees to his aflainished daughter, explained to her what had been done in her name, and the manner in which the fucceflion was proceeded to. She received the intelligence with perfect ferenity, and expreffed herfelf much better pleased with the act of relinquifhing, than she had been with that of affuming, the crown. Lady Jane and her husband were arraigned, and sentence of death was pronounced upon them. She received the notification of this event with her accustomed mildnefs and calmness, and prepared herself for the catastrophe. Mary's religious zeal induced her to fcnd divines for the conversion of Jane to the catholic faith; and the time first fixed upon for the execution was prolonged three days, in order to aid their efforts. But they were encountered with equal zeal on her part; and her confidency remained unshaken. On the evening before her death she wrote to her fifter, lady Catharine Grey, a letter, said to have been in the Greek language, which she fent to her with the prefit of a Greek Tefament. The alleged fulbance of the letter in English is given in the Biographia Britannica; but from its length it may be doubted whether any scholar in Europe could have compofed it in Greek within that time. Another account, more probable, says, it was written in Latin. On the fatal morning, her husband, who was confined separately, having obtained permission from the officers, fent a tender request to take a last farewell of her. This, however, through the Army, the fentiment the fentiment might be fhaken by fuch a meeting, the thought it beft to decline; and she contented herself with giving him a parting token out of her window as he was led to ex-
ecution. She saw undisturbed his remains brought back, and wrote on the occasion three sentences, in Greek, Latin, and English, in her table-book, which she kept by her during the conduct to the Tyburn Tower. Her turn soon followed. With a composed countenance she proceeded to the scaffold, where she made an address to the bystanders, acknowledging her fault in not resisting with sufficient firmness the crown which was forced upon her, and expressing her willingness to expiate her crime by death. She affected her woody beauty before her defence, took up her defence, and laying her head upon the block, received the fatal stroke, Feb. 12, 1554. History does not record a more heroic end than that of this young woman of between sixteen and seventeen. She was universally pitied, and even bigotry has treated her memory with respect.

GREY (Richard), a learned divine of the church of England, born in 1693. He was early entered of Lincoln college, Oxford, where he took his degree of M.A. in 1713. The first prebend which he obtained was the rectory of Kincote, in Leicestershire; and afterwards he was appointed to the rectory of Hinton, in Northamptonshire, and to a prebend in the cathedral-church of St. Pauls. In 1720 he published his Memory Technica, or a new Method of artificial Memory, applied to, and exemplified in, Chronology, History, Geography, Astronomy; also Jewish, Grecian, and Roman Coins, Weights, and Measures, &c., with Tables proper to the respective Sciences, and memorial Lines adapted to each Table, 8vo. of which a fourth edition appeared in 1756. His method consists in expressing numbers by artificial words, and in making such a change in the ending of the name of a place, person, planet, coin, &c., without altering the beginning of it, as shall readily suggest the thing sought, at the same time that the beginning of the word, being preferred, shall be a leading or prompting syllable to the ending of the word. It redounded great credit to the author's ingenuity, and might certainly be rendered of use in history and chronology. In the same year he published, A System of English Ecclesiastical Law, extracted from the Codex Juris Ecclesiastici Anglicani of the Right Rev. the Lord Bishop of London, for the Use of Young Students in the Universities, who are designed for Holy Orders, 8vo. For this work the university presented him with the degree of doctor of divinity. In 1736 he published a large anonymous pamphlet, entitled, The miserable and distracted State of Religion in England, upon the Downfall of the Church established; and in 1738, A New and Easy Method of Writing without New Words, annexed, by Way of Praxis, the Book of Proverbs, divided according to the Metre; with the mathematical Readings in Roman Letters, &c., a grammatical Analysis, and short Notes critical and explanatory, 8vo. In the following year he published, on a large single sheet, Tabula cactus Paradisiatica Verborum Hierosolimitorum regulare & irregularare, per omnes Conjugationes, Modos, Tempora, &c. Petronios, planum & accuratum excusis; & alio Historia Hierofolimana, litteras Romanas quam Hebraicas excusis, cum Verfum Interlinexs S. Pagnini, & vocum Indice Analytice, præmissit nova Methodus Hierosolimitana, diligentissime recognita, &c., 8vo. In 1743, Dr. Grey published, Liber foli in Herbares Matrice demum, cum Verfione Latinae Alberti Schultena, Notitie ex ejus Commentario excerpta, &c. Editit, etque Annotationes suos ad Metrum Practice Spectantes, adjectus R.G. &c. Accedit Canticum Moys, Dar. XXXII., cum Notis variorum, 8vo. In the preface to this work some strictures were introduced on particular passages in Warburton's Divine Legation; to which that gentleman replied in his Remarks on several Occasional Reflections, &c. This reply called forth from Dr. Grey, in 1744, An Answer to Mr. Warburton's Remarks on several Occasional Reflections, so far as they concern the Preface to a late Edition of the Book of Job; in which the Subject and Design of that divine Poem are set in a full and clear Light, and some particular Passages in it occasionally explained, &c., 8vo. In 1746 Dr. Grey published the poetical Essay on the Life of Bishop of Leicester. In 1749 he published, The late Words of David, divided according to the Metre, with Notes critical and explanatory, 4to. His last publication, excepting new editions of some of his former pieces, was an English translation of Mr. Hawkins Brown's poem, De damnum Immortalitate, which appeared in 1753. Besides the articles enumerated above, Dr. Grey printed some single Sermons, preached on public occasions. He died in 1771, in the seventy-eighth year of his age.

GREY-FLY, J. See OSTRUS.

GREY-HOUND, J. [see EJUS, Saxon.] A tall fleet dog that chases by light:

The impatient greyhound, shot from far,
Bounds o'er the globe to catch the fearful hare. Dryden.

GREY-LACH, a town of Germany, in the duchy of Carniola: eight miles north of Rudolphiviert.

GREY'SAN, a town of Silesia, in the principality of Neisse; eight miles south-east of Neisse.

GREZ-EN BOUE-PO, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Chateaugontier: two leagues and a half east-north-east of Chateaugontier, and five south-east of Laval.

GREZEL, a town of France, in the department of the Loiret: two leagues and a half north of Monceau, and three quarters south of Puy-Évence.

GREZANO, or GREZZANA, a small town in Italy, on the road to Germany, twelve miles north of Verona, and two from Brevino. This place deferves notice on account of the remarkable bridge of Beja, formed by nature, which connects two hills with each other; its arch is fifty feet broad, and its utmost height amounts to a hundred and fourteen Veronefe feet.

GRIAS, J. [It is the name of a plant in Apuleius, but the derivation is unknown.] In botany, a genus of the class polyandria, order monogyina, natural order of gutiferae, Subf. The generic characters are:—Calyx: perianthium one-leaved, cup-shaped; mouth four-cleft, finally lacerated. Corolla: petals four, roundish, cucave, coriaceous. Stamina: filaments numerous, fetaeous, longer than the corolla, inferted in the receptacle; anthers roundish. Pistillum: germ somewhat deprecded, immersed in the calyx; style none; stigma thickish, four-cornered, hollowed out cross-wise. Pericarpi: drupe large, roundish, acuminate at the base and tip. Seed: nucleus scored with eight furrows.—Ejential Character. Corolla four-petalled; calyx four-cleft; stigma fveible, crof-shaped; drupca with an eight-furrowed nucleus.

Grias cauliflora, or anchovy pear. This is a tree, and frequently grows to the height of fifty feet. Branches at the top, simple, short, or none. Leaves on short pedioles, pendulous, two or three feet long, wedge-shaped at the base, oblong-attenuated, entire, marked with nerves and veins, wrinkled, smooth. Flowers from the stem, on very short, scaly, many-flowered, peduncules; corollas large, white. The uprightness of the growth, and the largeness of the leaves, give this tree a very elegant appearance. The fruit is about the size of an alligator's egg, and much like it in shape, only a little more acute at one end, and of a brown rufset colour. This beautiful tree is frequent in many parts of Jamaca, and grows generally in low moist bottoms, or hummocks of waters. The fruit is picked in the West Indies, and eaten in the same manner with the East-Indian mango, which it exactly resembles in taste.

Propogation and Culture. Put the stipes into the ground soon after the fruit is gathered, and keep the plants constantly in the dark-bed in the sixove. In the West Indies
Indies the seeds grow very readily, wherever they meet with a sufficient quantity of moisture, and propagate so thick, that the trees are always found formed into thickets or large clutters.

GRANCHA, a town of Russia, in the government of Saratov, on the Medveditza: forty miles south-south-west of Saratov.

GRIAZOVETZ, a town of Russia, in the government of Vologda: forty miles south-south-east of Vologda. Lat. 58. 36. N. Ion. 58. 30. E. Ferro.

Gribaldì (Matthew), unfamed Mola, a learned jurist, born at Chieri in Piedmont. He opened a school of law at Padua in 1548, where he taught with great applause to a large number of auditors. But having imbibed the principles of the reformers, he was obliged, in 1553, to withdraw secretly from that city. He wandered about for some time, and in 1555 was introduced to Calvin in Geneva; but, as he had incurred suspicion of being addicted to the opinions of the unitarians, that reformer refused to give him the hand of fellowship till he had cleared himself in that particular. Gribaldi refused to give him this satisfaction, wherefore he was ordered to depart from the city; and the recent fire of Servetus was an adequate admonition for him not to delay. He was received at Tubingen through the means of Vergerius, and for some time occupied the chair of law in that university, till implicating persecution obliged him to quit it. He then repaired to Bern, in the neighbourhood of which he purchased an estate, with the intention of spending his days there. But being cited before the magistrates to answer for the heresies imputed to him, he was obliged to retract, in order to gain his liberty. The fincerity of this retraction was doubted, since he afforded a retreat in his house to the persecuted Gentilis; and he would have again been molested, had he not been carried off by the plague in 1564. Gribaldi was accounted very eminent in his profession, and a friend of justice and equity. He wrote commentaries on the pandects, and other parts of the civil law.

Gribner (Michael Henry), a learned civilian of Germany, born at Leipzig in 1682. He was first made professor of law at Witttemberg: whence he passed to Dresden, and was finally recalled to Leipzig to succeed M. Mencke. He died in 1734. Befides several academical disquisitions, he wrote, 1. Principia prosecti judiciaria; 2. Princips jurisprudentiae naturalis, a small work much esteemed; 3. Opuscui juris publici et privati.

GRID, v.n. [gridare, grid. Spedtlor.] To grind; to press with the teeth, as bread; to cramp the stomach; to press the reins, as a horse.

GRIDELIN, adj. A colour mixed of white and red: the ladies drefs'd in rich fymars were seen. Of Florence fatten, flower'd with white and green.

GRIDERSON, f. A portable grate on which meat is laid to be broiled upon the fire.

GRIDIRON, f. [from grid, Islandic.] A portable grate on which meat is laid to be broiled upon the fire. —He added two bars to the gridiron. Spectator.

GRIEG, f. [from grive; griff, Welsh, probably from the Old English Sorrow; trouble for something past. —Wringing of the hands, knocking the breast, are but the ceremonies of forrow, the pomp and ostentation of an effeminate grief, which speak not so much the greatness of the misery as the finalness of the mind. South.

I will inflict my forrow to be proud: For grief is proud, and makes his owner rout. Shake."
The cause of uneasiness. Used of such causes as are the effects of human conduct.—What remedy can be found against grievances, but to bring religion into countenance, and encourage those who, from the hope of future reward, and dread of future punishment, will be moved to justice and integrity? Shaks.

To GRIEVE, v. a. [grev, fr. griever, Flemish; gravis, Lat.] To afflict; to hurt.—For he doth not afflict willingly, nor grieve the children of men. Luke iii. 33.—Forty years long was I grieved with this generation. Ps.—It repented the Lord that he had made man on earth, and it grieved him at his heart. Gen. vi.

Grieved at the thought, he vow'd his whole endeavou' Should be to close those breaches. Dryn.

To make sorrowful.—When one man kills another, thinking that he killed a wild beast; if the same man remember afterwards what he hath done, and is not grieved for the fact, in this case he hath sinned; because his not grieving is offensive unto God, though the fact were merely besides his will. Perkin.

To GRIEVE, v. n. To be in pain for something past; to mourn; to sorrow, as for the death of friends. It has something at and sometimes for before the cause of grief: perhaps at is proper before our misfortunes, and for before our faults.—Do not you grieve at this? Shak.

With equal mind what happens let us bear;
Nor joy nor grieve too much for things beyond our care.
Dryen.

GRIEVINGLY, adv. In sorrow; sorrowfully:
Grievously, I think,
The peace between the French and us not values
The cost that did conclude it.
Shakespear.

GRIEVOUS, adj. [gravis, Lat. or from To grieve.] Afflictive; painful; hard to be borne.—Correction is grievous to him who has offended. —Exprefling a great degree of uneafiness.—He durst not disobey, but sent his complaint to the parliament of the usage he was forced to submit to. Rowe.

It was a grievous fault,
And grievously hath Cæsar answer'd it. Shak.

Sometimes used adverbially in low language.—He cannot come, my lord; he's grievous sick. Shak.

GRIEVOUSLY, adv. Painfully; with pain: with pain;
Wide was the wound, and a large lukewarm flood,
Red as the rose, thence gushed grievously. Spenser.

With discontent; with ill-will.—Grititus perceiving how grievously the matter was taken, with the danger he was in, began to doubt. Knolles.—Calamitously; miserably.—I see how a number of souls are, for want of right information, oftentimes grievously vexed. Hooker.

Vexatiously; to a great degree of uneasiness.—Hounds built in plaine are apt to be grievously annoyed with more and dirt. Ray.

GRIEVOUSNESS, f. Sorrow; pain; calamity.—They fled from the swords, from the drawn sword and from the bent bow, and from the grievous wars of war. f. xxi. 18.

GRIFALCO, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra: four miles west of Squillace.

GRIFALCO, a town of Italy, in the kingdom of Naples, and province of Otranto: seventeen miles south-east of Otranto.

GRIFFEN, a town of Germany, in the duchy of Carinthia: four miles north of Wolkenmarck, and fourteen east-north-east of Clagenfurt.

GRIFFET (Henry), an eminent writer among the Vol. IX. No. 569.
He that dar’es to die,
May laugh at the grim face of law, and scorn
The cruel wrinkle of a tyrant brow.  —Denham.

Their swarthy heaps would darken all our plains,
Doubling the native horror of the war,
And making death more grim. —Addison.

Ugly; ill-looking.—Venus was like her mother; for
her father is but grim. Shakespeare.

Stout stood up to him
Divine Ulysses; with looks exceeding grave and grim.
—Chaffian.

GRIM-VISAGED, adj. Of grim appearance.—Grim-
visor'd war hath smooth'd his wrinkled front. Shakespeare.

—Grim-visaged comfortless despair. Gray.

GRIMACE, f. [Fr. from grim.] A distortion of
the countenance from habit, affection, or infolence.—
The French nation is addicted to grimace. Spottel.

He had not spair’d to show his pigues
Against th’ haranguer’s politics,
With smart remarks of leering faces,
And annotations of grimaces.

Air of affection:
Vice in a vizard, to avoid grimace.
Allows all freedom, but to see the face. —Granville.

GRIMALDI (Francesco), an eminent painter of
landscape and history, born at Bologna, in 1606, from
whose hands he acquired the name or title of Lognese.
After graduating in the school of Hammibal
Caracci, he completed his studies at Rome; and his
improvement was such as to attract the attention of pope
Innocent X. by whom he was employed both in the
gallery of his palace at Monte Cavallo, and in the Va-
tican. Among his numerous admirers and friends were
the princes Pamfili, the pope’s nephew, and many of the
principal nobility at Rome; Louis XIV. and cardinal
Granville.

GRIMARDI, / 

GRIM'SAY, one of the smaller western islands of
Scotland, between North Viit and Benbecula.

GRIM'NESS, /. Horror; truthfulness of visage.

GRIMMEN, a town of Germany, in the
province of Pomerania; three miles north-east of
Dresden.

GRIMM'S, /. [So named in honour of J. Fred.
Car. Grimm, archbishop of Gotha.] In botany; a genus in
the order of mofles, comprehending some Linnean

GRIMMING, a mountain of Germany, supposed to be
the highest in Stiftia: sixteen miles west of Rottenmann.

GRIMM, or GRIMMEN, a town of Germany, in the
circle of Upper Saxony, and county of Leipzig: it contains
three churches and a college. Its chief trade is in wood,
linen, thread, beer, and flannels, made in imitation of
the English: fifteen miles east-south-east of Leipzig,
and forty-two west-north-west of Dresden.

GRIMMIA, /. Horor; frightfulness of vifage.

GRIMMEN, a town of Germany, in the
circle of Upper Saxony and Ucker Mark of Brandenburg;
one mile north-west of Joachimsthal.

GRIMPELOW, a town of Poland, in the
province of Podolia; forty-five miles north-north-west of Winiata.

GRIM'SI, a river of Germany, in the circle of
Upper Saxony, which runs into the Hoth four miles north
of Coburg.

GRIM'SAY, one of the smaller western islands of
Scotland, between North Viit and Benbecula.
together and withdraw the lips, either in anger or in laughter; forty miles east of Sion.

The realm at Grimby, made an ordinance respecting the grinning to Speed, to twelve pounds. In this was also a grinning and only using their teeth. Others grinning and to frantic mirth. Madmen, we fancy, gave an ill timed birth to grinning laughter, and to frantic mirth. Prior.

To fix the teeth as in anguish. I like not such grinning honour as Sir Walter hath; give me life, which if I can save, so; if not, honour comes unlook'd for, and there's an end. Shakespeare.

GRIN, f. The act of closing the teeth and showing them. The mules were so drawn together on each side of his face, that he shewed twenty teeth at a grin. Addison.

He laughs at him, in's face too,—You mistake him; 'twas a humble grin, The laughing joy of courtiers and of dogs. Dryden.

GRIN, 1. [grinn, grine, Sax.] A snare; a trap. The grin shall take him by the heel, and the robber shall prevail against him. Job xviii. 9.

Like a bride that hasteth to his grin, Not knowing the peril. Chaucer.

GRIN, a town of Aria, in Armenia: one hundred and thirty miles north-east of Erivan.

GRINDEL, one of the smaller western islands of Scotland, near the east coast of Benbecula.

To GRIND, v. a. preter. grando; part. past. grändus. [grändan, gränden, ground, Sax.] To reduce any thing to powder by friction; to comminute by attrition. And whosoever shall fall on this stone, shall be broken; but on whomsoever it fall fall, it will grind him to powder. Matt. Is a small drop of rain any wiser than the ocean? Or do we grind innominate corn into living meal? Bentley. To sharpen or smooth by rubbing on something hard.

Meeting with Time. Slack thing, said I; Thy ncythe is dull; whet it, for shame.

No marvel, sir, it he did reply.

If it at length deserve some blame;
But where one man would have me grind it,
Twenty to one too sharp do find it. Herbert.

To rub one against another. That the stomach grinds the substances which it receives, is evident from the digestion of animals which have swallowed metals, which have been found polished on the side next the stomach. Arbuthnot. To harass; to oppress. Some merchants and tradesmen, under colour of furnishing the colony with necessaries, may not grind them so as shall always keep them in poverty. Bacon.

Not knowing 'twas my labour, I complain Of sudden-footings, and of grinding pain;
My throws came thicker, and my cries encrease'd. Dryden.

To GRIND, v. n. To perform the act of grinding; to move a mill.

Fetter'd they send thee
Into the common prifon, there to grind
Among the flaves and asiles. Milton.

To be moved as in the act of grinding:
Shrinking fweats start.
And smeary foams works o'er my grinding jaws. Rowe.

GRIND, a town of Germany, in the circle of Welfphalia, and duchy of Juliers: twenty miles north-north-west of Coblenz.

GRIND, a small island near the coast of Friesland: nine miles north-north-west of Harlingen. Lat. 53° 18' N., long. 5° 36'. E. Ferro.

GRINDAL (Edmund), a learned English prelate, born at Beninghough, near Whitehaven, in Cumberland, in 1519. He very early discovered a strong inclination for learning, and, after he had studied through the grammar school, was sent to Magdalen college, in the university of Cambridge. From that institution he afterwards removed to Christ's college, and thence to Pembroke-hall, where he was chosen fellow in 1538. He commenced M. A. in 1551. In 1549 he was appointed, senior proctor of the university; and during the following year was chosen lady Margaret's preacher at Cambridge. In such high estimation was he now held for his talents and learning, that when, in the year last men
tioned, an extraordinary act was kept for the entertain-
ment of King Edward's visitors, he was one of the four
benefactors selected out of the ablest scholars in the uni-
versity, to debate the questions, "Whether transubstan-
tiation could be proved by plain and manifest words of
Scripture?" and "Whether it might be collected and
confirmed by the consent of fathers for a thousand years
after Chrift?" Grindal maintained the negative on
both questions, and acquitted himself on the occasion
with great honour and applause. His learning, piety, and
virtue, recommended him to the acquaintance of
Dr. Ridley, then bishop of London, and to that of the
celebrated Martin Bucer, who entertained a great esteem
for him. In 1550 bishop Ridley appointed him a chap-
lin; and in the following year collated him to the
precentorship of St. Paul's cathedral. His next pro-
motion was to the honourable appointment of chaplain
to his majesty, which took place towards the close of
the year last-mentioned; and in 1552 he obtained a rank
in Westminster-abbey. Upon the death of King Ed-
ward, in 1553, Mr. Grindal retired into Germany, to
avoid the persecution under Queen Mary, and settled
at Strasburg, where he applied with great diligence to
the study of the German language, in order to qualify
himself to preach in the churches of that country.
While in Germany, he was very industrious in collect-
ing authentic accounts of the lives and writings of the
fathers, which the chaplain required him to conftrupe,
to understand their preseitations. Of his attention in this
manner his mind was fixed on a book of fixed statutes for Christ-church
completed before his death, which took place at Croy-
don in 1583, when he was sixty-three years of age. He
was a prelate of considerable learning, great piety,
common moderation for the age in which he lived, and
of unblamable and exemplary manners. To him the
French protestants were greatly indebted for assistance
in obtaining permission to open a church in London, ac-
cording to their own formularies and discipline; which
was the origin of the French church in Threadneedle-
street. None of his writings were published, excepting
the Sermon above-mentioned, and A Dialogue between
Custom and Truth, published in Fox's Acts and Monu-
ments, vol. ii. towards the conclusion of the ninth book.

GRINDDELWALD, a town of Switzerland, in the
province of Berne, on the right bank of the river Aar.

GRINDER, f. One that grinds; one that works in a
mill.—The instrument of grinding:
His heart a solid rock, to fear unknown,
And harder than the grinder's nether stone. Sandys.
which we call the molar-teeth, or grinders; and pointed teeth, or canine, which are between both. Bacon.

The teeth, in irony or contempt:

One, who at the sight of supper open'd wide His jaws before, and whetted grinders try'd. Dryden.

GRIN'DER'S ROT, f. A disease of the lungs to which fly-sh grinders are subject, from an accumulation of particles of sand mixed with iron-duff. The disorder is among themselves called by this name.

GRINDING, f. [from the verb.] The act of sharpening an edged tool by friction; the act of rubbing one thing against another. Oppression.

GRIN'DLESTONE, or GRINSTONE, f. The stone on which edged instruments are sharpened. —Literature is the grindstone to sharpen the coulers, and to whet their natural faculties. Hammond.

Such a light and metall'd dance Saw you never yet in France; And by the lead-men, for the nonce, That turn round like grindstones. Ben Jonson.

GRIN'DON RIGG, a village in the county of Northumberland, remarkable for a battle fought there in 1558, in which the town was defeated by the earl of Northumberland and his brother: nine miles north of Woolley.

GRIN'NER, f. One that grins.

GRIN'NING, f. [from the verb.] The act of setting the teeth as in anger; derision expressed by a grin.

GRIN'NINGLY, adv. With a grinning laugh.

GRIN'STead, or EAST-GRINSTEAD, a town in the county of Sussex, and a borough by prescription, of great antiquity, consisting of a bailiff and about thirty-five burgage-holders, who elect two members of parliament. The bailiff is the returning-officer, and is chosen by the burgage-holders, at the annual court of the lord of the borough, who is the duke of Dorset. The first return of this borough is anno Edward I. The town is pleasantly situated on a hill, near the borders of Surrey, thirty miles from London, commanding a beautiful prospect every way around. The parish is one of the largest in the county; it had a large handsome church, the spire of which was destroyed by lightning in 1655: a very beautiful lofty tower was then built, but, owing to the badness of the materials and the manner of building it, on November 12, 1785, having flood just one hundred years, it fell on the body of the church, and damaged it in such a manner that the whole was obliged to be taken down and rebuilt on a smaller scale. The Lent alizes for Sufsex were long holden here; but for the greater accommodation of the county, they have for some years past been removed to Horsham, where the county gaol is situated. Here is a weekly corn-market on Thursdays; and three annual fairs, namely, April 21, July 13, and December 11; the first and last of which are large fairs for all kinds of cattle. There are also two fairs at Forest-Roe, in this parish, about three miles from the town, viz. June 25 and November 8; the latter is for cattle, pedlars' ware, &c.

At the east end of the town is a large handsome stone building, erected in the form of a square, called Sackville College, founded by James Sackville, earl of Dorset, in the reign of James I. about the year 1616: he endowed it with 30s. a-year. Here twenty-four aged persons of both sexes are accommodated each with a couler, with an allowance of eight pounds per annum to each person. This college is governed by a warden and two gentlemen-attendants. There is a very neat chapel for the use of the pensioners, where the warden reads prayers every morning; and which was used for divine service while the parish-church was rebuilding. Here is a charity-school for twelve boys, founded by Robert and Edward Hayne, esqs. in 1768. The town is a great thoroughfare, being the direct post-road from London to East Bourn, Lewes, and Brightling-mstone.

GRIPE, or GRIPES, f. [Gripes, Sax.] A little ditch or trench.

To GRIPES, v. a. [Gripes, Goth. Grippen, Sax. gripen, Dut. grijen, Scot.] To hold with the fingers closed; to grasp; to press with the fingers:

He that speaks doth grieve the hearer's wist, Whilft he that hears makes fearful action

With wrinkled brows. Shakespeare

To hold hard:

He feiz'd the shining bouche with grijing hold, And rent away with cave the ling'ring gold. Dryden.

[Griper, Fr.] To catch eagerly; to seize:

You took occasion to be quickly grieved, To grieve the gen'ral way into your hands. Shakespeare

To close; to clench:

Unlucky Well'd! thy unfeeling hand,
The more thou tickleft, grijes his hand the faster. Pope

To pitch; to press; to squeeze:

A wondrous way it for this lady wroght, From lion's claws to pluck the grijed prey. Spenser

To give a pain in the bowels;

Thus full of counsel to the den he went, Grij'd all the way, and longing for a vent. Dryden.

To GRIPES, v. n. To feel the colic; to have the belly-ach.—Many people would, with reason, prefer the grijing of an hungry belly to those dihes which are a feast to others. Locke.—To pinch; to catch at money meanly.—His mean revenue, by being scattered, in the wort of times growing upon him, when others that had great ones, by grijing, made them less. Fel.

GRIP, f. Graft; hold; seizure of the hand or paw.—They put a barren sceptre in my grij: Shakespeare

I fell; and with my weight the helm, constrain'd, Was drawn along, which yet my grij retain'd. Dryden.

Squeeze; prehure:

'Tis true, the harden'd bread resist the grij, And the cold lips return a kiss unripe. Dryden.

Oppression; crushing power:

I take my case Out of the grij's of cruel men, and give it To a most noble judge, the king my master. Shakespeare.

Affliction; pinching distress:

Can't thou bear cold and hunger? Can these limbs, Fram'd for the tender offices of love, Endure the bitter grijes of smarting poverty? Otway.

An old name for a vulture:

Titius liath his lot To feed the grij that gnaws his growing heart. Tick, and Stiffm.
fafe with the hand; the act of feizing with the hand; a kind of colic; a pain in the bowels.

GRIPPLINGLY, adv. With pain in the intestines.—Clysters help, left the medicine flop in the guts, and work gripingly. Bacon.

GRIPPLE, adj. Greedy.—Tho' on his shield he grille
hold did lay. Spenser.

He gnawed his teeth, to see
Those heaps of gold with grille covetise. Spenser.

GRIFFINO, [See GRIFFIN, a kind of .colic; a pain in the bowels, gripplingly.

GRIFFIN, adj. [grap, Sax.] Dreadful; horrible; hideous; frightful; terrible.

His grisly locks, long grown and unbound, Diforder'd hung about his shoulders round. Spenser.

In vifion thou shalt fee his grisly face, The king of terrors raging in thy race. Dryden.

GRIFFO, one of the smaller Granadillas, situated between Diamond isled and Caraico. It is uninhabited, having no fresh water.

GRIFFON, a kind of .colic; a pain in the bowels, gripplingly.

GRIFFIN, a kind of .colic; a pain in the bowels, gripplingly.

GRIFFO, one of the smaller Granadillas, situated between Diamond isled and Caraico. It is uninhabited, having no fresh water.

GRIFFON, a kind of .colic; a pain in the bowels, gripplingly.

GRIFFIN, a kind of .colic; a pain in the bowels, gripplingly.

GRIFFO, one of the smaller Granadillas, situated between Diamond isled and Caraico. It is uninhabited, having no fresh water.

GRIFFON, a kind of .colic; a pain in the bowels, gripplingly.

GRIFFON, a kind of .colic; a pain in the bowels, gripplingly.

GRIFFON, a kind of .colic; a pain in the bowels, gripplingly.

GRIFFON, a kind of .colic; a pain in the bowels, gripplingly.

GRIFFON, a kind of .colic; a pain in the bowels, gripplingly.

GRIFFON, a kind of .colic; a pain in the bowels, gripplingly.
fighting men into the field: but their chief security arises from the narrow defiles and high mountains by which they are surrounded.

Of the jurisprudence, religion, &c. of the Grifons, the following narrative is given by Mr. Coxe, in his Travels in Switzerland. Throughout the three leagues the laws are the same, and are derived from the municipal customs. The courts of justice in each community are composed of the chief magistrate, who presides, and a certain number of jurors, chosen by the people: they have no regular salaries, but receive for their attendance a small sum, arising in some communities from the expenses of the process, which are defrayed by the criminal; in others from a fund allotted by the municipal authorities. Since that period, all religious concerns have been regulated with perfect cordiality. According to the general consent of the three leagues, each community, being absolute within its little territory, has the power of appointing its own particular worshipping, and the inhabitants are free to follow either the catholic or reformed persuasion. In the administration of civil affairs the league has no interference; but the deputies of the general diet may be members of either communion, as chosen by the communities which they represent. By this moderate and tolerating principle, all religious diffentions have been suppressed, and the most perfect amity subsists between the two sects.

In spiritual concerns, the catholics for the most part are under the jurisdiction of the bishop of Coire. For the affairs of the reformed churches, each league is divided into a certain number of districts, the ministers whereof assemble twice every year: these assemblies are called colloquia. Each colloquium has its president, and each league a superintendant called a dean. The supreme authority in spiritual concerns is vested in the synod, which is composed of the three deans, and the clergy of each league; the synod assembles every year alternately in each of the three leagues. Candidates for holy orders are examined before the synod. The necessary qualifications for admission into the church ought to be the knowledge of Hebrew, Greek, and Latin; but this rule is not strictly adhered to; many barnabites are admitted to the holy orders with either of those languages. Formerly Latin was solely used, as well in the debates of the synod as for the purpose of examining the candidates; but at present that tongue grows more and more into disuse, and German is employed in its stead.

The principal part of the mountains of the Grifons abound in metals, minerals, fossils, and mineral springs; salt is obtained from Tyrol; most of the peasants wear woollen and linen cloth of their own manufacture. The number of inhabitants of the Three Leagues is estimated at one hundred and fifty thousand souls; and of their subject countries, the Valteline, Bormio, and Chavannes, is one hundred thousand. The German language is chiefly made use of in the towns, and in all public acts.

GRISSEL, a woman's name.

GRIST, f. [grist, Sax.] Corn to be ground: Much grist from Cambridge to his lot did fall, And all the corn they used at scholar's hall, Millers.

Supply; provision:

Matter, as wise logicians say,
Cannot without a form subsist;
And form, say I, as well as they,
Must fail, if matter brings no grist.

GRIST to Mill, is profit; gain.—The computation of degrees, in all matrimonial causes, is wont to be made according to the rules of that law, because it brings grist to the mill. Ayliffe.

GRISTLE, f. [gristle, Sax.] A cartilage; part of the body next in hardness to a bone.—See the article ANATOMY, vol. i. p. 582-584, and the correspondent engravings.—No living creatures, that have shells very hard, as oysters, crabs, lobsters, and especially the tortoise, have bone within them, but only little gristles. Bacon.—Let the apperity or hardness of cartilages should hurt the oesophagus or gullet, which is tender and of a skinny substance, or hinder the swallowing of our meat, therefore the annulary gristles of the windpipe are not made
made round, or entire circles; but where the gullet touches the windpipe, there, to fill up the circle, is only a soft membrane, which may easily give way to the dilatation of the gullet. Ray.

GRISTLINESS, f. The state or quality of being gritty. Scott.

GRISTLY, adj. Cartilaginous; made of gristle. Fins are made of gristy spokes, or rays, connected by membranes; so that they may be contracted or extended like women's fans. Ray.

Each pipe, distinguish'd by its gristy rings.

GRIST, f. [Gr. 

GRISTSTONE, f. A stone consisting of sand agglutinated together. Its properties differ according to the fineness or coarseness of its grain, and the firmness of its texture. Some kinds are pounded, to convert them again into sand; others are used for building, others for grinding edge tools, and others for filtering water, commonly called filtering-stones.

GRIST, f. [Saxon.] Peace, concord, agreement.

GRIST'BREECHE, /. A breach of the peace.

GRIST'TINESS, y. Sandiness; the quality of abounding in grit. In fuller's-earth he could find no sand by the microscope, nor any grittiness. Mottram.

To GRISTLE, v. a. [from grit.] To grind coarsely. Scott.

GRITT'TLY, adj. Full of hard particles; consisting of grit. —I could not discern the unevenness of the surface of the powder, nor the little shadows let fall from the gristy particles thereof. Newton.

GRITZ'GALLEN, a town of the duchy of Courland; twenty miles south-south-west of Sculber.

GRIEVES, f. Sandiness; the quality of abounding in grit. —In fuller's-earth he could find no sand by the microscope, nor any grittiness. Mottram.

To GRIT'TLE, v. a. [from grit.] To grind coarsely. Scott.

GRIT'TINESS, y. Sandiness; the quality of abounding in grit. —In fuller's-earth he could find no sand by the microscope, nor any grittiness. Mottram.

GRIT'TLE, v. a. [from grit.] To grind coarsely.

GRIT'TLY, adj. Full of hard particles; consisting of grit. —I could not discern the unevenness of the surface of the powder, nor the little shadows let fall from the gristy particles thereof. Newton.

GRITZ'GALLEN, a town of the duchy of Courland; twenty miles south-south-west of Sculber.

GRIEVE, f. [Saxon.] Peace, concord, agreement.

GRIEVE'S, f. A breach of the peace.

GROAN, v. n. [Griroom, Sax, grewn, Dut.] To breathe with a hoarse noise, as in pain or agony. —Men groan from out of the city, and the soul of the wounded crieth out. Job xxiv. 11.

So shall the world go on,
To good malignant, to bad men benign,
Under her own weight groaning.

GROAN, f. Breath expired with noise and difficulty, from pain, faintness, or weariness: I led to slaughter, and to slaughter leave;
And e'en from hence their dying groans receive. Dryden.

Hence aching bosoms wear a visage gay,
And stilled groans frequent the ball and play. Young.

Any hoarse dead found:
Such sheers of fire, such bursts of horrid thunder,
Such groans of roaring wind and rain, I never
Remember to have heard. Shakespeare.

GROANFUL, adj. Sad; agonizing. Not used.

Adown he kept it with so puissant wret
That back again it did aloft rebound,
And gave against his mother earth a groanful found.

GROOT, f. [groot, Dut. groote, It.] A piece valued at four-pence. A proverbial name for a small sum.

—Imagine a person of quality to marry a woman much his inferior, and without a great to her fortune. Swift.

My mother was wont
To call them woolen vallies, things created
To buy and sell with groats. Shakespeare.
I dare lay a great,
A terrant age is at leaft your lot. 
Dryden.

Groats, are oats that have the hulls taken off. Aino.

Grobe Bendonck, a town of Brabant: ten miles east of Antwerp.

Grob'ian, f. A slovenly ill-bred fellow. An old word.

Grob'ianism, f. [from grobian.] Ruffic behaviour; also melancholy. A. Noye.

Grojin, a town in the duchy of Courland: twenty-eight miles south-west of Goldingen.

Grobovopo'ole, a fort of Ruffia, in the province of Ekaterinburg: forty miles west of Ekaterinburg.

Grocer, f. [This should be written groffer, from gross, a large quantity; a grocer originally being one who deals in gross, or from grus, a fig, which their present rate seems to favour.]

But still the offspring of your brain shall prove
The grocer's care, and brave the rage of Jove. Garth.

Groc'ery, f. Grocer's ware, such as tea; sugar; raisins; spice. His troops, being now in a country where they were not expected, met with many cart-loads of wine, grocer, and tobacco. Clarendon.

Gro'deck, a town of Poland, in the patrimony of Bielik: forty miles south-west of Bielik.

Gro'ditz, a town of Silesia, in the principality of Neuff: three miles and a half north-west of Ottmuhau.

Gro'dno, a town of Lithuania, in the patrimony of Wilna, situated on the river Niemen, partly on an eminence and partly on a plain, surrounded with hills. Near it is an old cattle, in which the diets formerly assembled, but now fallen to decay, only one wing of it remaining, surrounded by a deep foss, and communicating with the town by a bridge. Augustus III built another, but did not live to inhabit it. In 1675, it was enacted, that every third general diet should be held in this town, which has not been regularly observed. The Roman catholics have nine churches, those of the Greek church have two, and the Jews have a synagogue. The market-place, and the principal street which leads to the cattle, are paved; the other streets in general are mean, and the houses for the most part little better than cottages. The number of inhabitants is estimated at seven thousand, many of which are employed in manufactures of linen, woollen, cotton, and silk. A medical academy was instituted here by the late king of Poland, for students in physick and surgery, at his own expense; and which, but for the late unfortunate troubles, bid fair to become of considerable consequence to the country: sixty-four miles south-south-west of Wilna. Ferro.

Gro'ens, a town of Germany, in the duchy of Holstein: ten miles south of Cimars.

Gro'feram, Gro'gram, or Gro'ran, f. [from grora, Fr. grogrogneus, Low Lat. Hunga.] Still woven with large stripes; a rougher - Natolia affords great store of chamelots and grooms, sandsys. Certes they're nearly cloth'd; I of this mind am, Your only wearing is your groseram. Donne.

Gro'hnde, a town of Germany, in the circle of Lower Saxony, and principality of Calenburg, on the Wefer, where a toll is paid. Near it is a monument of stone, erected in memory of a bloody battle fought here in 1421: nine miles south of Hameln.

Gro'in, f. [Of uncertain derivation.] The part next the thigh:

The fatal dart arrives,
And through the border of his buckler drives;

Vol. IX. No. 563.

Passed through and pierced his groin; the deadly wound,
Calt from his chariot, roll'd him on the ground. Dryden.

Groin, f. In architecture, an angle made by the interfeccion of two arches. It is of two kinds; regular, and irregular: viz. Regular, when both the arches have the same diameter; irregular, when one arch is a semicircle, and the other a semi-elliptic. Groins are chiefly used in forming arched roofs, when two or more arched vaults intersect with another; as in the roofs of churches, and in cells, wine-vaults, &c. See Architecture, vol. ii. p. 112, and the correspondent Engraving.

Gro'in'ard, a small island of Scotland, near the west coast of the county of Kofa: six miles south-west of Udghil Head.

Gro'll, a town of the Dutch States, or kingdom of Holland, in the county of Zutphen, strongly fortified, situated on the river Spinyle, whose waters fill the ditches round the fortifications. At the commencement of the revolt, it adhered firmly to the king of Spain. In 1593, the prince of Orange besieged it, but was compelled to retire by general Mondrong, who arrived with some troops to relieve the place; it was, however, taken four years after, when the Spanish army was engaged in Picardy. The marquis of Spinola took it from the Dutch in 1625, who laid siege to it again in 1627, under the conduct of prince Frederic Henry of Nassau. Lambert Vereycken, who commanded the attack, who was advancing to his assistance, had been twice repulsed. William, the natural son of Maurice, prince of Orange, and admiral of Holland, was killed at this siege. The important situation of the place, in the vicinage of Westphalia and the bishopric of Munster, induced the bishop of the latter, allied with the troops of France, to besiege it, in 1672; but the Hollanders retook it a short time after: nineteen miles east of Zutphen, and nineteen south-west of Oldenfeel. Lat. 52° 8' N. Long. 24° 80' E. Ferro.

Gro'mi, a town of Russia, in the government of Irkutsk: 112 miles north of Balaganko.

Gro'ming, a town of Germany, in the duchy of Storia, belonging to the archbishopric of Salzburg: twenty-five miles east of Rottenmanns, and forty west-north-west of Judenburg.

Gro'mwell, f. In botany; the gromill or graym, see Lythospermum.

Gro'n, f. [from the Sax.] A fanny place; a kind of bog. Obolea. Phillips.

Gro'na', a town of Germany, in the circle of Westphalia, and bishopric of Munster: twenty-five miles north-west of Munster.

Gro'nenbach, or Grunenbach, a town of Germany, in the circle of Swabia, belonging to the abbey of Kempen: thirteen miles north-north-west of Kempen.

Gro'nes, a cape on the north-west coast of the island of Jersey: six miles north-west of St. Aubin.

Gro'nesse Castle, a fort of the island of Jersey: four miles north-west of St. Helier.

Gro'ney, a river of Wales, which runs into the sea: the progress of the two factions, called Schyrings and Velcoopers;
Vet-coopers; but this rather increased than diminished the disorders. The inhabitants called in Edfar d count of Easter, and put themselves under his protection, but, in the year 1593, rebelled against him; who, in 1595, renounced all his rights to the duke of Guelders. In 1596, it was ceded to the emperor Charles V. from whom it passed to the house of Austria. It followed the example of the other provinces in throwing off the yoke of Spain, and, in 1594, was incorporated into the States General. It now holds the seventh rank in the kingdom under Louis Bonaparte.

Groningen, a city, and capital of the state of Groningen; large, rich, strong, well populated, and adorned with many excellent buildings, public and private. Its figure is nearly round, encompassed with good ramparts, guarded by large ditches filled with water, besides many bastions and other fortifications, which would render an attack upon it very difficult. Its port is very commodious, into which ships enter with great ease by means of a canal, whose sides are lined with large stones, about three leagues from the sea. It is watered by the river IJmen, which runs through it to the sea northward; the Dunfer runs eastward from it into the river Ems. This city has often suffered from the effects of war; in the year 1503, Albrect von Saxony laid siege to it, but being wounded, he was obliged to retire, and died a short time after at Embden; and peace was concluded by the mediation of the bishop of Utrecht; not long after, the inhabitants of Groningen broke the peace, and feized on Damme; Edfar d comte of Easter, reinforced by some troops of the bishop of Munster and Utrecht and of the duke of Brunswick, came to an engagement with them, and put them to the rout, with the loss of a thousand citizens and a thousand soldiers. Edfar d then attacked the city of Groningen, which surrendered, in 1595, after a long siege, and built a citadel to keep the citizens in awe, which was pulled down in 1544. The Spaniards rebuilt one of the towers of the citadel, which was not long afterwards destroyed by the inhabitants who destroyed their works after the peace of Ghent. In 1596, the citizens, being desirous of preserving their privileges, called in the emperor Charles V., to whom they submitted. At the commencement of the revolt they would not receive a garrison, nor enter into the famous Union of Utrecht, which is the reason why the province was not included in the Union of the United States. In 1575, Groningen adhered to the union, and took the oath of fidelity. George de Lalain, comte de Rennebourg, took it, by stratagem, on the 10th of June, 1579, for the king of Spain, and compelled colonel Schenck, who attempted to retake it in the following year, to raise the siege; but, in 1599, prince Maurice retook it, the 24th of July, 1599, in the presence of two thousand men; in 1602, the musketeers of the revolution were connived at, and that William, coun-german to prince Maurice, should be governor under the authority of the States. The bishop of Munster and elector of Cologne laid siege to it in 1574, with an army of twenty thousand men; but the besieged were reinforced by the United States. In 1578, of Augut, by the brave resistance of general Charles Robenhaut, the governor, who commanded a garrison of two thousand men; the citizens and the students sig- nalized themselves also very much in its defence. Groningen is by some said to take its name from Grunnius, a commander of the Gauls; but by others, with more probability, from the excellent green pastures by which it is every way surrounded. An university was es- tablished here in 1614, and endowed with the revenues of several monasteries; Ubbo Emminius, the celebrated his- toriographer of Easter, was the first rector. Groningen was anciently a free and imperial city; in 1599, it was reduced into a bishric by Pope Paul IV.; in the reign of Philip II. of Spain, but had only three bishops before the revolu- tion and confquent dilolution. It is eighty-one miles west of Bremen. Lat. 53° 11' N., Lon. 23° 54' E.

Groningenmark, a town of Germany, in the circle of Swabia, and duchy of Wirtemberg, on the Glems; thirty-six miles south of Raffau, and seven north-north-west of Stuttgart.

Gronna, f. In old writings, a pit, a bog, a quag-
with distinction by Cofnio grand duke of Tuscany, who appointed him to a professorship at Pifa. After an abode there for two years, he returned to Deventer, and resided on an invitation in 1679 to occupy the chair of Greek and history in the university of Leyden, he accepted it, and thereupon made that city his residence, notwithstanding several offers from other places. In 1701 he was nominated geographer to the university. He pulled a life of learned labour, and died in 1716. He wrote an extensive history of antiquities, Polybius, Tacitus, Servius the tragedian, Pompon, Mela, A. Gelius, Cicero, Ammianus Marcellinus, Haprastructure, the Greek geographers, Q. Curtius, Suetonius, Phaedrus, Arrian, Minut, Felix, Firmicus Maternus, and Horace, and also wrote notes upon some other authors, and dissertations on various subjects of antiquity. He published a Thesaurus Antiquitatum Graecorum, 13 vols. folio; and a Latin version of Agogini on ancient Gems. He also composed several pieces in controversy, Oration, &c. 

Gronsfeld, a town in Germany, in the circle of Westphalia, situated in a county of the same name: four miles south-east of Maerlic. 

GROOM, f. (groom, Dutch.) A boy; a writer; a servant.—In the time of Edward VI. lived Sternhold, whose life is known to have been spent in turning of David's Psalms into verse. 

Grope, v. a. To search by feeling in the dark; to feel where one is, without being able to see.—How vigilant to grope, and their noses no more, but see my way. Arbuthnot. 

To grope, v. a. To search by feeling in the dark; to feel without being able to see.—How vigilant to grope men's thoughts, and to pick out somewhat whereof they might complain. Hayward.

But Strephon, cautious, never meant The bottom of the pan to grope. Swift.
tionary of the Vulgar Tongue. 3. A Provincial Dictionary. 4. A volume of humorous essays entitled, The Grumbler. 5. A collection of anecdotes and poetical pieces, called The Grub. 6. A Treatise on the Customs and Manners of the People of Bengal; which country the author had visited in the army, in the earlier part of his life. His valuable work on the Antiquities of Ireland, in 4 vols., was edited by Mr. Ledwich, and published in 1794. His Antiquities of England and Wales, of Scotland, and Ireland, are therefore comprised in 10 vols.

GRO'LEN, a town of the duchy of Courland: twenty-eight miles south of Goldingen.

GROSLEY (Peter John), son of an advocate at Troyes, where he was born in 1718. He was brought up to the bar and became an advocate in parliament, but his taste led him to general literature and foreign researches. He twice visited Italy and England, and once Holland; he also made annual visits to the capital, where he was received in the best societies. He was an enemy to refraining, and loved to speak freely. His fortune, originally decent, was increased by a spirit of economy, which, however, did not prevent him from performing generous actions. He presented to his native city several marble busts of eminent men born there, which were placed in the Hotel-de-Ville. He died at Troyes in 1785. His principal works are: 1. Recherches pour servir à l'Histoire du Droit Français, 1752, much esteemed for the solidity of its erudition. 2. Vie des Frères Pitton, 1756, an interesting account of these friends of letters. 3. Observations de deux Gentilhommes Suédois fur l'Indie, 4 vols. 1750. 4. Landres, 3 vols. 1750. containing observations made in his visits to England. 5. Élais Historiques fur la Champagne. 6. Ephemerides Troyennes. 7. A great number of Letters, controversial pieces, Etudes, &c. published in the Journal Encyclopédique, from 1771 to 1783. He had also a share in the Mémoires Académiques de France.

GROSÔN, a town of France, in the department of the Jura, and chief place of a canton, in the district of Poligny; one league south-west of Arbois, and one north of Poligny.

GROSÔNE, a town of the island of Corsica: three miles south of Bastia.

GROSS, adj. [Graes, Fr. grôf, Ital. grasso, Lat.] Thick; bulky.

GROS-SA, a town of Germany, in the archduchy of Austria: three miles south of Magdeburg.

GROS-SA, a town of Germany, in the archduchy of Austria: three miles south of Magdeburg. Gros, adj. In the ancient feudal law, a villein in gross, or such a servile person as was not appurtenant to the host, or marœ, nor to go along with the tenure as appurtenant to it; but was like the other personal goods and chattels of his lord, at his lord's pleasure and disposal: so also advowson in gross differs from advowson appurtenant, being distinct from the manor. Can. Ltt. 120.

GROSS-SAL'ZE, a town of Germany, in the circle of Lower Saxony, and duchy of Magdeburg. Here are considerable salt-works: twelve miles south of Magdeburg.

GROSSO, a town of Germany, in the circle of Swabia, and duchy of Wirtemberg: ten miles south-west of Heilbronn, and thirteen north-north-east of Stuttgart.

GROSS-SAL'ZE, a town of Germany, in the circle of Lower Saxony, and duchy of Magdeburg. Here are considerable salt-works: twelve miles south of Magdeburg.

GROSS-SAL'ZE, a town of Germany, in the circle of Lower Saxony, and duchy of Magdeburg. Here are considerable salt-works: twelve miles south of Magdeburg.

GROSSELINGEN, a town of Germany, in the circle of Lower Saxony, and duchy of Magdeburg. Here are considerable salt-works: twelve miles south of Magdeburg.
Upper Saxony, and electorate of Saxony. Amber is found near it; four miles south-west of Schmiedeburg.

GROSSZIG, a town of Germany, in the circle of Upper Saxony, and principality of Anhalt Dessau; nine miles south-west of Dessau, and nine south-west of Bernburg.

GROSENVEN, [grest venr, Fr. a great hunter.] A surname.

GROT, L. [groette, Fr. grotte, Ital.] A cave; a cavern for coolness and pleasure.

In the remotest wood and lonely grot,
That meet to work that evil, thought. Prior.

GROTIANUS, Hugo), one of the most illustrious names in modern literature, born at Delft, April 10, 1583. His father John de Grot (the proper family name) was a respectable citizen of Delft, of which he was a citizen and burgomaster, and a like wise curator of the university of Leyden. His mother was of one of the first families in the country. Hugo from his childhood gave proofs of wonderful quickness of parts; and it is affirmed that at eight years of age he composed Latin elegies and vers. His memory was prodigious, his judgment solid, and his application indefatigable. In his twelfth year he was sent to Leyden, where he was under the care of Francis Juius. The celebrated Joseph Scaliger, then almost at the head of literature, was so much struck with the abilities of young Grotius, that he generously undertook to direct him in his studies. At the age of fourteen he maintained public theses in mathematics, and which was received with great admiration by the most eminent scholars of the age, Pontanus, Meursius, Barlaeus, Duafa, Heinius, mentioned him as a prodigy, and foretold his future distinction in the republic of letters. A proof of the depth and compass of his reading at this early period, was given by his edition of a difficult and obscure author, Martianus Capella, which he translated at the age of fourteen. His studies were agreeably and usefully interrupted in 1598, by a journey to France in the company of the ambassador-extraordinary of the States, who was the excellent Barneveldt. He was introduced to Henry IV. who gave him a gracious reception. He took the degree of doctor of civil law in France, and during a residence of a year, received many attentions from men of rank and learning.

In 1599, Grotius, who was destined to the bar, pleaded his first case at Delft. Soon after, he published his Capella, which he disfigured before he went to France, and which was received with great admiration by the learned. This was followed by a Latin translation of a tractate by Stevinus, containing directions for finding a ship's place at sea; a task which proved his acquaintance with the principles of mechanics and navigation. An edition of the Phenomena of Aratus, which he published in 1609, with annotations of the Greek text, and a number of learned remarks, obtained the highest praise for its deep erudition from Scaliger, De Thou, and Lipsius. In the mean time he relaxed from severer studies by the cultivation of Latin poetry, in which he gained the reputation of a master. He did not confine himself to short and occasional pieces, but composed tragedies on sacred subjects. In 1608, he married Mary Reigerst, a lady descended from one of the best families in Zealand, and whose father had been burgomaster of Delft. In the following year he published an elaborate work, entitled Mare Liberum, afferting the right of the Dutch to trade to the East Indies, in opposition to the
The place of his confinement was the fortress of Louv-
frain, near Gorkum, in South Holland. His wife nobly
refused to accept of the proposal, and for her sake was
allowed to remain in close custody by the commandant,
who desired to inform the commandant's wife of the cer-
munity. The happy escape was effected on March 22, 1621.
His heroic wife in the mean time kept up a belief that he
was confined to his bed by illness, till, learning his safety, she
conceded the deed. She was detained in close custody by
the enraged commandant, till a petition which he pre-
vented to the States-General procured her discharge.

The embassy which Grotius chose was France. The
ambassador of that country at the Hague, Du Maurier,
had been closely connected with him, and had interfered
with vigour in favour of Barneveldt and the rest of the
party. He furnished Grotius with letters of recommenda-
tion, which besides received assurances of the royal pro-
duction from the president Jeannin. He arrived in Paris,
and was received with much friendship by some leading men. He was followed, however, by the
hated of his countrymen, who, by the medium of their
ambassadors,
ambassadors, spread all sorts of calumnies against him, which he generously repaid by speaking of his country with the attachment of a zealous citizen. He was more hurt by a report which they raised of his intention to forfeit his pardon of the States. This he publicly contradicted; observing that it was not likely he should so contumeliously receive new favours from him, if he refused to do while in prison. He experienced the bigotry of the French Calvinists, who refused to admit him to communion unless he renounce the tenets of Arminianism; on which account he had divine service performed at his own house. These cauuses of chagrin were compensated by the marks of respect which he continually received from Grotius, and epigrams were written upon the thought that Holland had now made amends to France for the injury of robbing her of the great Scaliger. It was some time before Grotius could obtain from the court that particular assistance which was necessary to enable him to maintain his family in Paris. At length, in March 1622, he was presented to the king, who received him very graciously, and settled upon him a pension of three thousand livres.

After a year's residence in Paris he was de فهي of a country retreat, and accepted an offer from the president de Melmes to occupy his seat of Balagni, near Sénlis. There, in 1623, he began his celebrated work De Jure Belli et Pacis, which was finished in 1625. As the princes and magistrates of France were not only as her servant, but as a man so high in the respect of her character and talents, he declared him counsellor to the young queen of Sweden, Christine, and her ambas-

After a year's residence in Paris he was de فهي of a country retreat, and accepted an offer from the president de Melmes to occupy his seat of Balagni, near Sénlis. There, in 1623, he began his celebrated work De Jure Belli et Pacis, which was finished in 1625. As the princes and magistrates of France were not only as her servant, but as a man so high in the respect of her character and talents, he declared him counsellor to the young queen of Sweden, Christine, and her amba-

general, who, in December 1631, had issued an ordnance for his apprehension, which was disregarded, repeating it in the March following with the promise of a reward, he found himself in a dangerous situation. He therefore left Holland, and proceeded to Hamburgh, where he paifted about two years. Though his circumstances were not inimical, he had no confidence while in prison. He experienced the bigotry of the French Calvinists, who refused to admit him to communion unless he renounced the tenets of Arminianism; on which account he had divine service performed at his own house. These causes of chagrin were compensated by the marks of respect which he continually received from Grotius, and epigrams were written upon the thought that Holland had now made amends to France for the injury of robbing her of the great Scaliger. It was some time before Grotius could obtain from the court that particular assistance which was necessary to enable him to maintain his family in Paris. ment; but finding that he obtained nothing but compliments, he grew impatient, and requested permission to retire. Christina seemed to wish to keep him at her court in quality of counsellor of state, and proposed to send for his wife and family; but he declined, on account of the rigour of the climate and his own declining health. Wearied out with delay, he at length set out without a passport, and went to a sea-port town in order to embark for Lubeck. The queen, informed of his departure, sent to desire another interview with him; which he exacted amicably, and which was the last he had with a considerable fortune money, and a casket of plate. A vessel was also provided for his conveyance, on board of which he embarked on August 12. He met with a violent storm, which obliged him to go on shore not far from Danzig. He set out for Lubeck in an open wagon, exposed to the wind and rain, and arrived at Rostock greatly indisposed. A physician who was called in soon declared him to be in danger, upon which Grotius requested the presence of a clergyman. The Lutheran minister, John Quisfohr, who attended on this occasion, has given a plain narrative of the last hours of this great man, which bears all the marks of fidelity, and serves to confute the many idle and calumnious reports raised on the subject. He expired at midnight, on the 16th of August in the thirty-third year of his age. A number of his relatives and friends fent to desire another interview with him. His remains were interred in Delft, in the family tomb. Grotius had three sons and three daughters; of whom the sons and one daughter, with their mother, survived him.

Few writers have distinguished themselves in more branches of literature than Grotius. His excellence in Latin poetry has already been mentioned. It consisted not only in great facility of versification and arête of his pieces, but also in strong and manly original sentience, his Latin form was read all over Europe, was translated into all its languages, and even into some of those of the East; and still, in our schools and universities, is used both for its matter and language, in the instruction of youth on this important topic. He gave an edition, with notes, of Lucretius's Pharsalia, in 1614, and of Tacitus, in 1620. These were authors perfectly congenial to him; and he has frequently hit off their genius and style in difficult passages, in a manner of which a mere verbal critic, however learned, would never have been capable. His Latin letters compose a considerable part of his works. Some are critical, but most are upon matters of business, which he treats with extraordinary facility in a dead language.

Of the surviving sons of Grotius, the elder, CORNELIUS, and the youngest, DIDERICUS, followed the profession of arms. The second, PETER, was bred to the law, and became penurious of Amsterdamm and deputy of the States-general. His brother, WILLIAM, was a civilian and a man of learning, and was the correspondent and confidant of Grotius during his whole life.

GROTON, a township of the American States, in Caledonia county, Vermont, situated westward of and adjoining to Ryegate township, on Connecticut river, nine miles north-west of Bennington, and contains, by the census, 1,390 inhabitants.

GROTON, a township of the American States, in New-London county, Connecticut, having Fisher's Island Sound on the southward, and Thames river on the west; which separates it from New-London, to which it formerly belonged. It was incorporated in 1705, and consists of two parishes, containing 3966 inhabitants. In 1735, there were in this town forty-four of whom could read, and seventeen were church members.

GROTON, a township of the American States, in Middlesex county, Massachusetts; thirty-five miles north-west of Boston, and contains, by the census, 1,830 inhabitants.

GROTON, a township of the American States, in New-London county, Connecticut, having Fisher's Island Sound on the southward, and Thames river on the west; which separates it from New-London, to which it formerly belonged. GROTTAGLI, a town of Italy, in the kingdom of Naples, and province of Otranto; nine miles east of Tarento.

GROTTA MENNARD'A, a town of Italy, in the kingdom of Naples, and province of Principato Ultra; twelve miles east-south-east of Benevento.

GROTTA SPAL'DA, a town of Italy, in the province of Tarento. It is situated on the sea coast, and contains, by the census, 500 inhabitants.

GROTTA ST. LO'RIA, a town of Italy, in the kingdom of Naples, and province of Capitanata; twelve miles west of Manfredonia.

GROTTAG, or GROTTA, a town of Silezia, and capital of a circle, in the principality of Neisse, and on the river Oder. In 1435, this town was destroyed by Wladislaus duke of Poland, and the town was again destroyed by William duke of Trespo. In 1449, 1450, and 1551, it was destroyed by fire, and in the year 1633 and 1642 it was pillaged. Fourteen miles north of Neisse, Lat. 52° 43'. Long. 15° 19'. E. Ferro.

GROTTA, f. [grotta, Fr. grotte, Ital.] A cavern or cave made for roosters. — It is not used properly of a dark hollow cavern.

Their careless chiefs to the cool grottos run,
The bow's of kings, to shade them from the sun. Dryd.
GROTTOLI, a town of Italy, in the kingdom of Naples, and province of Basilicata: four miles south-west of Matera.

GROV'A, a town of Africa, on the Grain Coast: ten miles north-west of Cape Palmas.

GROVE, Henry, a learned English non-conformist divine, born at Taunton in Somersetshire, in 1683. Upon his being sent to the grammar-school, his quickness of apprehension and love of literature enabled him to make so rapid a progress in classical learning, that at the age of fourteen he was judged sufficiently prepared for entering on academical studies. His acquaintance with the classics was continued through life, and his relish for them increased as his judgment and knowledge of mankind improved: the Latin poets, philosophers, and historians, and the Greek moralists, being ever his delightful companions. Mr. Grove went through a course of academical learning under the revered Mr. Warren of Taunton, whom in 1706 he succeeded, upon his decease, in the matter of that fermentary, which he maintained during the rest of his life. As a writer, Mr. Grove not only with great clearness represented the Scripture notion of faith, and rescued it from entusiastic or contradictory interpretations; but has shown in an able manner the reasons why the writers of the New Testament often speak of faith as a most essential part of religion. He fell a victim to the attack of a fever in January 1723-4, in the fifty-fifth year of his age. In 1740, were published Mr. Grove's Poetical Works, in 4 vols. 8vo.—in 1742, two additional volumes of his Sermons;—in 1742, A Collection of all his controversial pieces, with the addition of some Sermons, Charges at Ordinations, &c. in 4 vols. 8vo.—and, in 1749, his System of Moral Philosophy, in 2 vols. 8vo. with additions by the editor; a work still held in considerabe estimation.

GROVE POINT, the point which forms the north side of the mouth of Saffira's river, in Chesapeake bay, in North America: five miles south-west of Turkey Point.

To GROVEL, v. n. [gro'dle, Irish, flat on the face. It may perhaps come by gradual corruption from ground ed.] To creep low on the ground. Upon thy belly groveling thou shalt go. Milton.

What see'lt thou there? king Henry's diadem, Inchas'd with all the honours of the world! If fo, gaze on, and grovel on thy face, Until thy head be circled with the same. Shakespeare.

To be mean; to be without dignity or elevation. Several thoughts may be natural which are lowland and groveling. Addison.

I must disclaim whate'er he can express; His groveling lance will fow my passion leas. Dryden.

GROVE'S CREEK, a creek of the American States, in Tennesee, seven miles from King's Spring, and two from the foot of Cumberland Mountain.

GROVELLER, f. A person of a grovelling disposition. The man of a towering ambition, or a well-regulated taste, has fewer objects to envy or to covet than the grovelers. Shenstone.

GROUND, f. [grond, Sax. groth, Dan.] The earth, considered as superficially extended, and therefore related to tillage, travel, habitation, or almost any action. The main mafs of terrene matter is never called the ground. We never distinguish the terraqueous globe into ground and water, but into earth, or land, and water; again, we never say under earth, but under ground.—Israel shall go on dry ground through the sea. Exod. xiv. 16.

Man to till the ground
None was, and from the earth a drowsy mist
Went up, and water'd all the ground. Milton.

The earth as distinguished from air or water.—I have made man and built upon the ground. Jerem. 12.

To late young Turnus the delusion found;
Far on the sea, tossing from the ground. Dryden.

Land; country:
The water breaks its bounds,
And overflows the level grounds. Haldibas.

Region; territory:
On heavenly ground they stood, and from the shore
They view'd the vast immensurate abys. Milton.

Estate; possession:
Uneasy still within these narrow bounds
Thy next design is on thy neighbour's grounds:
His crop invites, to full perfection grown;
Thy own seems thin, because it is thy own. Dryden.

Land occupied:
The rains o'erflow'd my ground,
And my poor Flinders's mare was drown'd. Prior.

The floor or level of the place. Wherefore should I
Faint thee to the ground? 2 Sam. ii. 22.

—Some part of the month of June, the water of this lake descends under ground, through many great holes at the bottom. Brown.—Dregs; lees; faces; that which settles at the bottom of liquors. Plural only. Some infusion having had particular succes in sweeping gangrenes, from the use of the grounds of strong beer, mixed up with bread or oatmeal. Shirp.—The first stratum of paint upon which the figures are afterwards painted. We fee the limner to begin with a rude draught, and the painter to lay his grounds with darksome colours. Hackw. The fundamental substance; that by which the additional or accidental parts are supported. Indeed it was but just that the finest lines in nature should be drawn upon the most durable ground. Pope.

Then, wroght into the soul, let virtues shine; The ground eternal, as the work divine. Young.

The plain song; the tune on which defcarasts are raised:
Get a prayer-book in your hand, And stand between two churchmen, good my lord; For on that ground I'll build a holy defcent. Shakespeare.

First hint; first traces of an invention; that which gives occasion to the rest: Though jealousy of state th' invention found, Yet love refrinds'd upon a former ground; That way the tyrant had referv'd to fly, Pursuing hate, now ferv'd to bring two lovers nigh. Dryd. The first principles of knowledge. After evening repafts, 'till bed-time, their thoughts will be best taken up in the easy grounds of religion, and the story of Scripture. Milton.

Here flatemen, or of them they which can read, May of their occupation find the grounds. Donne.

The fundamental cause; the true reason; original principle.—Sound judgment is the ground of writing well. Reason.

Thou could'st not have discern'd Fraud in the serpent, speaking as he spake, No ground of enmity between us known. Milton.

The field or place of action; Here was thy end decreed, when these men rode; And even with theirs this act thy death did bring, Or happen'd at the least upon this ground. Daniel.
The space occupied by an army as they fight, advance, or retire: Heartless they fought, and quitted soon their ground, Whil'st our's with easy victory were crown'd, Dryden.
The intervening space between the flyer and pursuer.—Superiors think it a detraction from their merit to seize another get ground upon them, and override them in the pursuit of glory, Speckter.
Even whilst we speak our conqueror comes on, And gathers ground upon us every moment. Addison.
The state in which one is with respect to opponents or competitors.—Whatever ground we may have got upon our enemies, we have got none upon our vices, the worst enemies of the two; but are even subdued and led captive by the one, while we triumph so gloriously over the others. Atterbury.
Had I thou sway'd as kings should do, Giving no ground unto the house of York, They never then had sprung, Shakespeare.
State of progress or recession.—I have known so many great examples of this cure, and heard of its being so familiar in Austria, that I wonder it has gained no more ground in other places. Temple.
The folly to fact a thing off: Like bright metal on a fullen ground, My reformation glittering o'er my fault, Shall shew more goodly, and attract more eyes, Than that which hath no fool to set it off, Shakespeare.
To ground, v. a. To fix on the ground. To found. To settle in first principles or rudiments of knowledge. To fix on the ground. To sound;—To fix on the ground. To sound. To settle in first principles or rudiments of knowledge. To give a true delineation, if it be a timber-building, of the several sizes of the ground-plates, breast-funnings, and beams. Mortimer.
GROUND-PILOT, n. The ground on which any building is placed: A ground-plot square five hives of bees contains; Emblem of industry and virtuous gains. Harte.
The iconography of a building.
GROUND-PLUMBING, n. With angles, the method of finding the depth of the water with a line and plummet.
GROUND-RATAN', n. in botany. See Rhapis.
GROUND-RENT, n. Rent paid for the privilege of building on another man's ground:
The site was neither granted him, nor given; 't was nature's, and the ground-rent due to Heav'n. Harte.
GROUND-ROOM, n. A room on the level with the ground.—I beseeched him hereafter to meditate in a ground-room; for that otherwise it would be impossible for an artist of any other kind to live near him. Tatler.
GROUND-TACKLE, n. A sea term; the tackle necessary to secure a ship at anchor.
GROUND-TIMBERS, n. In a ship; the timbers which lie on the keel.
GROUND-TOW, n. The coarser kind of tow that comes from hemp or flax after it has passed the hatchel.
GROUND-AGE, n. A custom or tribute paid for the standing of a ship in a port.
GROUNDLY, adv. Upon firm principles. He hath given the first hint of speaking groundedly, and to the purpose, upon this subject, Glanville.
GROUNDLESS, adj. Void of reason; wanting ground.—We have great reason to look upon the high pretensions which the Roman church makes to miracles as groundless, and to reject her vain and fabulous accounts of them. Atterbury.
But when vain doubt and groundless fear Do that dear foolish becom fear. Prior.
GROUNDLESSLY, adv. Without reason; without cause; without just reason.—Divers persons have produced the like by spirit of vitriol, or juice of lemons; but have groundlessly ascrib'd the effect to some peculiar quality of those two liquors. Boyle.
GROUNDLESSNESS, n. Want of just reason.—He durst not cite the words either of my book or sermons, lest the reader should have discovered the notorious falsehood and groundless errors of his calumni. Tillotson.
GROUNDLING, n. A fish which keeps at the bottom of the water; hence one of the low vulgar. It offends the heart by being too refined a polly-pitted fellow a passion to tatters, to very rags, to split the ears of the groundlings. Shakespeare.
GROUNDLY, adv. Upon principles; solidly; not superficially. Not in use.—A man, groundly learned already, may take much profit himself, in using by epigrams to draw other men's works, for his own memory into shorter room. Aiton.
GROUNDSEL, or GROUNDSEL, n. [ground and tile, the brows, Sax. perhaps from jelle, Lat.] The timber or raised pavement next the ground.—The rab¬bet on the groundsel is levelled downwards, that rain or snow may the freer fall off. Moxon.
GROUNDSEL, n. in botany. See Senecio.
GROUNDSEL-TREE, n. See Echinus.
GROUNDWORK,
GROUNDFiARK, sfi. The ground; the first fame
i.eum; the first part of the whole; that to which the
rest is additional.
A way there is in heav'n's expanded plain,
Which, when the skies are clear, is seen below,
And mortals by the name of milky know:
*Dryden.*
The first part of an undertaking; the fundamentals.
The main skill and groundwork will be to temper them
such lectures and explanations, upon every opportunity,
as may lead and draw them in willing obedience. *Milton.*
—First principle; original reason.—The moral is the
first business of the poet, as being the groundwork of his
information. *Dryden.*
GROUP, sfi. [gruppo, Fr. groupe, Ital.] A crowd; a
clutter; a huddle; a number thronged together.—In a
picture, besides the principal figures which compose it,
there are less groups or knots of figures disposed at pro-
per distances, which are parts of the piece, and seem to
carry on the same design in a more inferior manner. *Dry-
den.*
You should try your gravning tools
*Swift.*
To GROUP, v. t. To put into a crowd; to huddle
together.—The difficulty lies in drawing and disposing
of, as the painters term it, in grouping; such a multitude
of different objects, preserving all the justice and con-
formity of style and colouring. *Prior.*
GROUPADE, sfi. In the manege, a leap higher than
an ordinary covert.
GROUP'S ISLANDS, two chutters of islands in
the South Pacific Ocean, extending for the space of
nine leagues. The two largest are separated by a strait
about four hundred fathoms wide, and each surrounded
by a number of small ones, as it were chained together
by rocks under water, and placed in all sorts of direc-
tions; they are all covered with coca-trees. The
inhabitants are well-proportioned, almost naked, and
painted brown, with black hair, tied in a kind of net-
work. *W. Greenwich.*
These islands were probably discovered by Rog-
gewin, L�. 117. 58. to 18. 6. S. 1011.142.45.10142.
GROUPSE, sfi. The red and black heath-game, for
preserving of which, no heath, furze, or fern, shall be
burnt on any heaths, moors, or other wastes, between
the 2d of February and 24th of June. 4 & 5 Will. & Mary,
c. 23. For the preservation, see the article Game,
for the natural history, see Te-
*ronto,* with the corresponding engraving.
The 'quires in scorn will fly the house
For better game, and look for groups.
*Swift.*
GROUT, sfi. [grout, Sax.] In Scotland they call it
grout. Coarse meal; pollard; groats.
GROUP, sfi. [grouper, Dut.] To vegetate; to have ve-
getable motion; to increase by vegetation.—He caueth
the grafs to grow for the cattle, and herb for the service
of man. *Dryden.*
—To be produced by vegetation:
In colder regions men compose
Poison with art, but here it grows. *Waller.*
GROW, v. n. preter, grew; part. pass. grown.
A sea term.—Mariners are used to the tum-
bling and rolling of ships from side to side, when the
sea is never so little
—A good man's fortune may grow out at heels.
*Shakesp.*
By degrees the vain deluded elf
Grow out of humour with his former fel-
*Harte.*
To proceed as from a cause or reason.—Take heed now
that ye fail not to do this: why should damage grow
to the hurt of the king? *S. Wh. 42.*
—To be changed from one state
to another; to become either better or worse; to turn.
A good man's fortune may grow out at heels. *Shakesp.*
Grow of the prince, to the prince.
Verfe, or the other harmony of prose, I have so long
studied and practis'd, that they are grown into a habit,
and become familiar to me. *Dryden.*
—To come forward; to gather ground.—Some seeing the end of their
government nigh, and troublous practice growing up,
which may work trouble to the next governor, will not
attempt redress. *Spenser.*
—To advance to any stage.—They doubted where-
unto this would grow. *Aid. v. 24.*
To ripen'd manhood he shall grow.
The greedy sailor shall the feas forego. *Dry-
den.*
To come by degrees; to reach any state gradually.
—Veufe, or the other harmony of prose, I have so long
studied and practis'd, that they are grown into a habit,
and become familiar to me. *Dryden.*
—To improve; to make progres.—Grow in grace, and in the know-
ledge of our Lord and Saviour Jesus Chrift, 2 Pet. III.
—To advance to any state.—They doubted where-
unto this would grow. *Aid. v. 24.*
But when to ripen'd manhood he shall grow.
The greedy sailor shall the feas forego. *Dry-
den.*
To proceed as from a cause or reason.—Take heed now
that ye fail not to do this: why should damage grow
to the hurt of the king? *S. Wh. 42.*
—To be changed from one state
to another; to become either better or worse; to turn.
A good man's fortune may grow out at heels. *Shakesp.*
By degrees the vain deluded elf
Grow out of humour with his former fel-
*Harte.*

Grow out of humour with his former fel-
*Harte.*
GROWLING, f. [from the verb.] The act of snarling; the noise of wild beasts' anger.

GROWME, f. An engine to stretch woolen cloth after it is woven. See the ancient flat. 43 Edw. III. c. 10. See Grow, or part. of grow. Advanced in growth. Covered or filled by the growth of anything. —I went by the field of the fruitful, and by the vineyard of the man void of understanding; and lo, it was all grown over with thorns, and nettles had covered the face thereof. Proverbs.

GROWTH, /. Vegetation; vegetable life; increase of vegetation. —To arrive at full growth or stature.—I saw lately a pair of China shoes, which I was told were for a great woman, that would become big enough for one of our little girls. Locke.

GROWTH, /. A vice, and has grown—Locke.

GROWTH, /. The part. past. of grow. [from the s. v. grow.] Enlarges hourly, prevailing on the pulp. Philips.

Grow, f. A small worm, the larva of the insect tribes. See Entomology, vol. vi. p. 834-845. —There is a difference between a grub and a butterfly, and yet your butterfly was a grub. Shakespeare.
He struggles into birth, and cries for aid;  
Then helpless in his mother's lap is laid:  
Grudge their life from whence his own began. —Dryden.

To give or take unwillingly:  
Let me at least a funeral marriage crave,  
Nor grudge my cold embrases in the grave. —Dryden.

To GRUDGE, v. n. To murmur; to repine. —They knew the force of that dreadful curse, whereunto idly maketh subject; nor is there cause why the guilty fasting the fame should grudge or complain of injustice. —Hooker. —To be unwilling; to be reluctant. —Many times they go with as great grudge to serve in his majesty's ships, as if to be slaves in the galleys. —Raleigh.

GRUDGE, f. Old quarrel; inveterate malevolence; reluctance; unwillingness, envy at the prosperity of others; a secret with or desire; none remains of a dislike. —Dryden.

GRUDGEING, adv. Unwillingly, malignantly; reluctantly. —Like harpies they could scent a plenteous board; then to be sure they never fail'd their lord; the reft was form, and bare attendance paid; then drank and eat, and grudgingly obey'd. —Dryden.

GRUDGER, /. One that grumbles; a murmurer; a discontented person. —To murmur with discontent. —Grumbling, the act of murmuring; a hoarse murmuring kind of noise; an indirect discovery of discontent. —I have serv'd Without or grudge or grumblings. —Shakespeare.

GRUME, /. Grumus, Sour; sullenly, morosely. —GRUM'LY, adv. Sullenly; morosely. —GRUMMEL-SEED, /. The seeds of gromwell: a thick viscid confluence of a fluid; as the white of an egg, or clotted like cold blood. —Quincy.

GRUMBLE, a town of Bohemia, in the circle of Lovegrave; a town and castle of Germany, in the circle of the Upper Rhine, and bishopric of Spire; four miles south of Bruchsal.

GRUM'BACH (Unter), a town of Germany, in the circle of the Upper Rhine, and bishopric of Spire, with a medicinal spring; three miles south-west of Bruchsal.

GRUM'BACH, a town of Germany, in the circle of the Upper Rhine, and country of Rhingrave; twenty-five miles north of Deux Ponts, and north-west of Lauterbeck.

GRUM'BACH, a river of Germany, in the circle of Upper Saxony, which runs into the Saal four miles north-east of Weifenfels, in Thuringia.

GRUB, a town of Germany, in the circle of Upper Saxony, and margraviate of Meiffen; two miles south of Wildorf.

To GRUMBLE, v. n. —To murmur with discontent. —Thou grumbling thunder, join thy voice. —Motteux.

GRUFF, adj. [from the grumble.] Sour; irritable. —To growl; to gnarl; —GRUFFLY, adv. Harshly; gruffly; roughly; —GRUFFNESS, /. Ruggenes of men; harshness of look or voice. —G R U 4.5

Around the fiend in hideous order, sat  
Foul bawling infancy and bold debate,  
Gruff discontent, through ignorance milled. —Garth.

All sheath'd in arms, and gruffly look'd the god. —Dryden.

GRULL'ENBERG, a town of Germany, in the circle of Upper Saxony, in Thuringia; four miles south of Sangerhausen.

GRUM, adj. [contracted from grumble.] Sour; irritable. —A low word. —Nic looked four and grum, and would not open his mouth. —Arbuthnot.

GRUMMED, p. p. —To murmur; to repine. —Grummed, grommed, grum. —From grommen, grummelcn. —Dryden.

GRUM'MELING, /. The act of murmuring; a hoarse murmuring kind of noise; an indirect discovery of discontent.

GRUM'BLER, /. One that grumbles; a murmurer; a discontented person. —I have serv'd Without or grudge or grumblings. —Shakespeare.

GRUM'MEL-SEED, /. The seeds of gromwell: a thick viscid confluence of a fluid; as the white of an egg, or clotted like cold blood. —Quincy.

GRUMM'TUM, now Armcnto, an inland town of Lucania, on the river Aciris. —L'Avare, not using half his store, —GRUM'BLING, adv. Unwillingly, malignantly; reluctantly.

The lion, though he sees the toils are set,  
Yet, pinch'd with raging hunger, scours away;  
The grumble of the wind in the lion's face, —L'Ejkrange.

That gathers black upon the frowning sky.  
And grumbles upon the frowning sky.  
Grumbles in the wind. —Rowe.

GRUMB'LER, f. One that grumbles; a murmurer; a discontented person. —Grumble, the act of murmuring; a hoarse murmuring kind of noise; an indirect discovery of discontent: Their cakes of grummelsseed they did preferre, And pailes of milke in sacrifice to her. —W. Browne.

GRUM'MEH-SEED, /. The seeds of gromwell: a thick viscid confluence of a fluid; as the white of an egg, or clotted like cold blood. —Quincy.
of Franconia, which runs into the Rednitz, three miles south-south-west of Neufie.

GRUNAU', a town of Silefia, in the principality of Nefle; three miles south-east of Gieflen, and twenty-eight miles north-west of Fulda.

GRUNBERG, a town of Germany, in the circle of the Upper Rhine, and principality of Upper Helfe; three miles north-north-east of Mollen.

GRUNDE, a town of Germany, in the circle of Lower Saxony, and territory of Nuremburg; six miles north-north-east of Cuftran.

GRUND, a town of Germany, in the circle of Lower Saxony, and New Mark of Brandenburg; twenty miles north-north-west of Cuftran.

GRUNDELSEE, a lake of Germany, in the duchy of Storia; two miles north-east of New Austie.

GRUNDLACH, a river of Germany, in the circle of Franconia, which runs into the Rednitz, three miles south of Erlang, in the territory of Nuremberg.

GRUNDLACH, a town of Germany, in the circle of Franconia, and territory of Nuremberg; six miles north of Nuremberg, and four south of Erlang.

GRUNE (Grand), a rock in the English Channel, near the south coast of the island of Jersey, about half a league south-west from Noirmont Point.

GRUNEBURG, a town of Silefia, in the principality of Glogau, surrounded with vineyards. It contains forty Glogau.

GRUND, a town of Germany, in the circle of Lower Saxony, and territory of Nuremburg; six miles north-west of Freystadt, and twenty-four north-west of Gros Glogau.

GRUNDBACH, a river of Germany, in the circle of the Upper Rhine, and county of Leiningen. It has two churches for Roman Catholics, Lutherans, and Calvinists; twenty-two miles north-north-west of Spire, and twenty-eight miles north of Mentz. Lat. 49. 32. N. Lon. 52. 47. E. Ferro.

GRUT, f. The noise of a hog; From hence were heard the grunts of bristled boars, and groans of bears, and herds of howling wolves.

GRUTLING, f. The common noise of a pig.

GRUTLING, f. A pig. A genus of fish; see Anthias.

GRUS, f. The Crane, one of the new constellations in the southern hemisphere; containing, according to Mr. Sharp's catalogue, thirteen stars.

GRUS, f. The Gruts, a kind of fish, [corrupted for the sake of rhyme.] GRUTING, f. The common noise of a pig.

GRUTCH, f. Malice; ill-will.

Hudpuras.

GRUTEN, a town of Germany, in the circle of the Upper Rhine, and county of Leiningen. It has three churches for Roman Catholics, Lutherans, and Calvinists; twenty-two miles north-north-west of Spire, and twenty-eight miles north of Mentz. Lat. 49. 32. N. Lon. 52. 47. E. Ferro.

GRUTER, John, Latin Janus Gruterus), GRUTEN, a town of Germany, in the circle of the Upper Rhine, and county of Leiningen. It has three miles south-east of Medman.

GRuter (John, Latin Janus Gruterus), an eminent critic, the son of a burgomaster of Antwerp, who, in the troubles of his country, took refuge in England. He married an English woman, and returned to Antwerp when the United States had taken possession of it. He was born in 1560, and in his seventeenth year accompanied his parents back to England. He received his first education under his mother, who was mistress of various languages. He studied for some years in the university of Cambridge, and then was sent to Leyden, for the study of jurisprudence; but although he took his degrees in law, he attached himself solely to polite literature, and at an early age published works on criticism. Having travelled into Germany, he was offered the professorship of history in the university of Wittemberg, by Christian duke of Saxony, which he accepted. But after the death of that prince, the government requiring from all the professors subscription to a formulary of doctrine as the condition of holding their places, Gruter preferred resignation to compliance. He was next elected one of the professors at Heidelberg, where he had the direction of its famous library. At the fack of this city by Tilly, in 1622, he suffered the loss of his own library, worth twelve thousand gold crowns,
crown, together with most of his other property. He died at Berthenken in 1627, having upon his death-bed received an invitation to the Greek and history professorship at Groningen. Of his works the principal are,

gy, f. [ly, Gr.] Any thing of little value; as, the pearing of the nails.

GRU, f. a measure containing one-tenth of a line. A line is one-tenth of a digit, and a digit is one-tenth of a foot, and a philosophical foot one-third of a pendulum, or one of the waves or vibrations, in the latitude of forty-five degrees, are each equal to one second of time, or one-sixtieth of a minute.

GRYALVA, a river in the province of Chipa, in New Spain, said to breed certain amphibious beads not observed that they eat them.

In entomology, Gryllus; a genus of the order hemiptera, including the Locusts, Crickets, Grasshoppers, &c.

Generic characters: Head infected, armed with jaws; feelers filiform; antennae sessile or filiform; wings four, deflected, convoluted; the lower ones plaited; hind-legs formed for leaping; claws double on all the feet. The insects of this genus feed on plants and herbs, except those of the division Truxalis, which prey on other insects: the larva and pupa resemble the perfect insect; the larva chelis under ground, and are fixed-footed, voracious and active; they were the only animals of this class which Moses permitted the Israelites to eat, and are at present used as an article of food by the natives of Africa and India. The genus consists of 252 species, which are chalked in five separate divisions or families, viz.

1. Truxalis. Antennae enflorm; head conic, longer than the thorax. 2. Gryllus nafutus; head conic; body green. The mouth is placed at the bafe of the head; the antenna at the tip; the wings are sometimes hyaline. Inhabits Africa.

2. Gryllus conicus; head conic; body brown; half the rib of the wing-cases green, with a line of white dots. Antenna brown, longer than the thorax; head brown, the sides green at the bafe; thorax brown, slightly frigate behind, with green sides and dorsal spot. Inhabits New Holland.

3. Gryllus vittatus; head prominent; body tawny; head, thorax, and hind-thighs, with a lateral filvery stripe. Antenna tawny; the filvery stripe is drawn through the head and thorax to the tip of the hind-thighs; hind-thighs with a bluish fillet and a line of filvery dots. Inhabits Chin.

4. Gryllus Hungarius; head conic; body green; antennae and legs tawny. Thorax with three raised lines; wing-cases with a ferruginous and black line beyond the middle. Inhabits Hungary.

5. Gryllus brevicorpus; head a little conic; body green; antenna compressed, as long as the thorax. This species varies much in colour. Inhabits America.

6. Gryllus crepusculus; head a little prominent; body green; wings rose-colour at the inner margin. Antenna green, sometimes yellow at the bafe; head and thorax sometimes variegated with yellow, the lateral edge crenulate; wing-cases acute, longer than the body; wings white; legs yellowish, with raised white dots; the hind-ones green, smooth. Inhabits Tranquebar.

7. Gryllus giganteus; green with two reddish fillets; antenna ferruginous; thorax with three raised lines. Inhabits America.

8. Gryllus brevicorpus: head filpulate at the tip; wing-cases longer than the body, with a longitudinal brown streak; wings yellowish, hyaline at the margin. Inhabits Southern Ruflis.

10. Acrydium. Thorax carinate; antennae filiform, shorter than the thorax; feelers equal. 16. Gryllus boron: scutel flat, pointed, as long as the abdomen. Body dusky; thorax carinate; legs blackish; hind-thighs compressed carinate. Inhabits Sierra Leone.

11. Gryllus bipunctatus; dark brown; scutel as long as the abdomen. Wings none; thorax with a black rhombic spot each side; a whitish line sometimes runs from the front through the middle of the scutel. Inhabits Europe.

12. Gryllus fabulatus; dark brown; scutel longer than the abdomen. Refembles the last; body sometimes grey or brown. Inhabits Europe.

13. Gryllus opacus; chestnut or black; thorax carinate, sometimes at the sides, as long as the abdomen. Inhabits Berlin.

16. Gryllus granulatus: varied with grey green and blackish, rough with raised dots and flattened at the sides; thorax fimbroid gibbous. Inhabits Berlin.

17. Gryllus leucophotis: brown; back of the thorax and scutel elevated and pale: scutel with a white spot each side at the base. Inhabits Europe.

18. Gryllus griffus: grey; a black spot each side the base of the scutel and behind the lamina of the wings. Inhabits Europe.

19. Gryllus bimatus: grey; a ferruginous spot each side the scutel towards the tip of the lamina of the wings.

III. Acheta. Antennae tawny; feelers unequal; thorax rounded; tail with two bristles. 20. Gryllus gryllotalpa, the mole cricket: wings, when closed, terminate in slender tails longer than the abdomen; fore-foot palmate. It is of a very unpleasant form. Its head, in proportion to the size of its body, is small and oblong, with four long thick palpi, and two long antennae as slender as threads. Behind the antenna are situated the eyes, and between those two eyes are seen three sternumata or feeler eyes, amounting to five in all, set in one
one line transversely. The thorax forms a kind of cylinder, oblong, almost cylindrical, which appears as it were velvety. The elytra, which are short, reach but to the middle of the abdomen, are crossed one over the other, and have large black or brown nervous fibres. The wings terminate in a point, longer not only than the elytra, but even than the abdomen; this latter is soft, and often concealed, the tarus. The whole animal is of a brown dusky colour. It haunts moist meadows, and frequents the sides of ponds and banks of streams, performing all its functions in a swampy wet soil. With a pair of fore-feet curiously adapted to the purpose, it burrows and works under ground like the mole, raising a ridge as it proceeds, but seldom throwing up hillocks. As mole crickets often infest gardens by the sides of canals, they are unwelcome guests to the gardener, raising up ridges in their subterraneous progress. When dug up, they take to the kitchen quarters, they occasion great damage among the plants and roots, by destroying whole beds of cabbages, young legumes, and flowers. When dug out they seem very flow and helpless, and make no use of their wings by day; but at night they come abroad, and make long excursions. In fine weather, about the middle of April, and into the close of May, when the heat begins, one sees a pair of tore-feet curiously adapted to the purpofe, it enter the fide of a canal, his fleye the truck too deep, pared off a large piece of turf, and laid open to view a curious scene of domestic economy: there were many caverns and winding passages leading to a kind of chamber, wctty smoothed and rounded, and about the fize of a moderate fruit-box. Within this secret nurfery were deposited near one hundred eggs of a dirty yellow colour, and encompassed in a tough skin, but too lately excluded to contain any rudiments of young, being full of a vicifous lubrication. The eggs lay but shallow, and within the influence of the fun, jutf under a little heap of feaweed movea mould, like that which is raised by ants.
of these insects; which, however, are so fiery and cautious, he observes, that it is no easy matter to get a fight of them; for, feeling a person's footsteps as he advances, they fly short in the midst of their song, and retire backward nimbly into their burrows, where they lurk till all is quiet. They are exceedingly unwilling to be attempted to dig them out with a spade, but without any great success; for either the bottom of the hole was inaccessible from its terminating under a great stone; or else, in breaking up the ground, the poor insect was inadvertently squeezed to death. Out of one of these cracks, when confined in a paper cage and fed to the full, and supplied with plants moistened with water, will feed and thrive, and become so merry and loud as to be irksome in the same room where a person is sitting; if the plants are not wetted, it will die."

31. Gryllus unbraculatus: black, wing-cases tinct with white; front covered with an obvate deflected membrane; wings and wing-cases white spotted with black. Antennae brown, a little longer than the body; head and thorax black; wing-cases short; abdomen black; tail with a spiny recurved projection nearly as long as the body; legs black; hind-thanks spiny at the tip. Inhabits America.

32. Gryllus holos: wings tailed, longer than the wing-cases; body brown; margin of the wing-cases dotted with black. Margin of the thorax yellow; legs whitish; antennae thrice as long as the body. Inhabits Santa Cruz.

33. Gryllus Guadeloupenis: wings without tails; body brown; legs pale. Thorax with a large yellowish spot; wings and wing-cases equal, hardly longer than the body; tail without the style; legs yellowish; hind-thanks ferrate. Inhabits Guadeloupe; small.

34. Gryllus allioni: head and thorax yellowish; wing-cases aqueous, as long as the wings. Antennae longer than the body; eyes black; wing-cases flat, rounded, water-colour; wings hardly longer than the cauces, sharp; abdomen black; fore-legs yellowish, the hind-ones brown with spiny thanks. Inhabits America.

35. Gryllus minutus: wings tailed; body yellowish; hind-thanks three-filicate. Inhabits America.

36. Gryllus filvestris: apterous, black; wing-cases vaulted, very short, cinereous with brown lines. Thorax pale with a blackish edge all round; abdomen black with a recurved spine longer than the two styles. Inhabits France; small.

37. Gryllus grilicoides: grey; thorax depressed; abdomen brownish, a little longer than the wing-cases; wings longer than the wing-cases, reticulate, grey-hyaline. Inhabits Jamaica.

38. Gryllus binotatus: black; base of the wing-cases with two yellow spots; antennae shorter than the body. Inhabits Europe.

39. Gryllus pellucens: whitish; thorax trapeziform. Head lucid; thorax with three brown spots; wing-cases yellowish. Inhabits Carniola and Italy.

41. Gryllus teffellatus: brown-tefaceous; wings teffellate with white and black. Inhabits St. John's Island. They may again by degrees.

42. Gryllus niveus: whitish; thorax trapeziform. Head lucid; thorax with three brown spots; wing-cases yellowish. Inhabits Carniola and Italy.

43. Gryllus surinamensis: grey-brown; thorax flat; wing-cases with an oblong black spot; hind-legs twice as long as the body. Inhabits Surinam.

44. Gryllus muticus; head and wing-cases bay; legs tefaceous; tail of the female unarmed. Inhabits Surinam.

46. Gryllus fasciatus: brown; thorax and wing-cases with fulvous lines. Inhabits Pennsylvania.

47. Gryllus niveus: whitish; thorax elongated, antennae and hind-thighs very long. Inhabits Pennsylvania.
49. *Gryllus punctulatus*: grey-brown; wing-cases hyaline with a brown dot; thorax elongated; feline-colour wings and antennae very long. Inhabits Penylvania. These three first divisions of Locusts are exemplified in the *Gryllus* Plate I. where fig. 1. represents the natus; 2. the giganteus; 3. the bicuspidatus; 4. the granulatus; 5. the mole-cricket; 6. the female of the same; 7. the monfrufus; 8. the membranaceus.

IV. **Locusta.** Antennae setaceous; feelers unequal; male with an ocellate spot at the base of each wing-case; tail of the female armed with a sword-like projection. This division includes many of the grasshoppers commonly so called. The female grasshopper carries, at the extremity of her abdomen, a kind of ferrated spine, composed of two lamine, and in shape broad, and turned up like the blade of a cutlass. These implements are employed by the female in digging in the ground, or in wood, holes for the reception of her ova; and this being a function in which the male has no share, he is unprovided with the instruments by which it is performed. The female grasshopper possesses an amazing fecundity; she regularly deposits from four to seven hundred eggs at a time. The wonderful part of the procreation, which she takes for providing them security, and food for the young as soon as they are disinclined, merit our particular notice. With that lancet, which we have already described, she excavates a number of holes in the dried branch of a tree; into each of these holes eight or ten of her eggs are dropped; there they are buried, with that kind of food which is most data to the young ones; and it was from the summit of a tree that it poured forth the notes of the grasshopper. The former either, walked over the leaves, or was fixed on a branch, while in the body of the female, they are enveloped within a covering, branched all over with veins and arteries. In this form they remain deposited under the surface of the earth, or inclosed in wood, apparently unaffected by the rigour of winter, till the genial heat of spring begins to hatch and vivify them. Then, the sun beginning with its warmth to animate all nature, the insect eggs feel its benignant influence; and generally about the beginning of May, each egg produces a larva about the size of a flea, at first of a white colour, but afterwards gradually turning brown. After having taken these measures for perpetuating her kind, the parent animal does not survive; as the winter approaches, she dries up, seems to feel the effects of age, and dies from a total decay. Some assert that she is killed by the cold; others, that she is eaten by worms; but certain it is, that neither male nor female are seen to survive the winter.

Visibly, the grasshopper discovers a very singular and complicated structure of viscera besides the gut, there is observed a small stomoch and behind that a very large one; still lower down, there is yet a third; so that it is not without some foundation, that all the animals of this tribe have been supposed to chew the cud, as they so much resemble ruminating animals in their internal conformation. Aristotle informs us, that they were greedily sought after as a delicate morsel by the Greeks; and that the season when they were deemed most delicious was a short time before they left their chrysalis state. The metamorphosis from that state is performed with great difficulty and agitation; many perish in this severe effort of nature, and those who survive are for some time in a languid and debilitated state.

50. *Gryllus citrifolius*: thorax nearly quadrangular, the angles crenate. Antennae nearly as long as the body; wing-cases green, leaf-like, with red nerves; legs ferrugineous. Inhabits India.

51. *Gryllus laurifolius*: thorax nearly quadrangular, smooth; wings mostly longer than the wing-cases. Thorax yellowish; wing-cases gibbous, green, leaf-like, with red nerves; wings hyaline green, at the tip; thorax yellowish; thanks and tarsi green. Inhabits America.

52. *Gryllus myrtiliolus*: thorax nearly triangular, smooth; wings defective, longer than the wing-cases; frow very short, recurved. Half the size of the last; tail of the male with a clavate forked lamina. Inhabits America.

53. *Gryllus fenestratus*: thorax smooth; wing-cases green; legs very spiny. Antennae very long, brown; head variegated with red; thorax smooth green, rounded behind and black; wing-cases with two spines in the middle and three small ocellate spots; wings white; body greenish with a sharp tooth on the back. Inhabitants East India; large.

54. *Gryllus camelollollus*: thorax defected; wing-cases concave, rounded at the tip and longer than the wings. Thorax of three segments, defected at the sides, rounded behind; abdomen greenish, the sword spiny; green tip white; legs greenish; thighs spiny. Inhabits America.

55. *Gryllus pleuroglus*: thorax subcarinate; wing-cases...
Curious Species of the three first Divisions of Locusts.

Gryllus.

66. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

67. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

68. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

69. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

70. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

71. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

72. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

73. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

74. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

75. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

76. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

77. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

78. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

79. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

80. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

81. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

82. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

83. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

84. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

85. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

86. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

87. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

88. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

89. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

90. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

91. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

92. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

93. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

94. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

95. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

96. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

97. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.

98. Gryllus thoracicus: head green; antennae yellow; body brown. Inhabits Tranquebar.
GR Y L L U S.

down the middle; body pale green, the three last joints blackish; antennae very long. Eyes blackish; wings paler green than the wing-cases; legs green. Inhabits Europe.

86. Gryllus brachypterus: grey-brown; wing-cases and wings half as long as the body. Sword of the female long, recurved. Inhabits Europe.

87. Gryllus ferratus: thorax smooth, green; fore-thighs and fringes white; body apertous. Thorax yellowish at the sides; antennae tefaceous longer than the body; sword straight, shorter than the abdomen. Inhabits Hungary; large.

88. Gryllus fuscatus: green; wing-cases brown, as long as the wings; front projecting, obtuse. Antennae brown, longer than the body; head green with a black dorsal line; thorax green brown on the back; wings hyaline; sword tefaceous, as long as the abdomen. Inhabits France; size of G. varius.

89. Gryllus papus: thorax ciliate with spines; abdomen tuberculate, spiny; body apertous. Scutel large, rounded, ciliate; hind-thighs four-toothed beneath. Inhabits Ethiopia.

90. Gryllus spinilicus: thorax muricate and furrowed with spines; body apertous. Antennae as long as the body; abdomen black with tefaceous spots; sword recurved. This is shown at fig. 9. Plate II. It inhabits India; and is perhaps the species noted by Mr. Jackson in his Journey from India, p. 139. "I here (between Diarbekir and Moful) caught some locusts of an extraordinary size, and very thick in proportion to their length. They have no wings, move quickly, and are easily taken. I soon found it necessary to be careful that they did not bite me, for I am persuaded that they could easily have bitten my finger to the bone. I tried one with a twig about as thick as a quill, which it bit through instantly. I then dissected one, and on examining one of its grinders found it nearly as large as a human tooth, and so hard, that I was not able to make any impression on it with my penknife. The grinders were nearly the colour of mahogany. Finding that we were not molested byflies or other insects, and ascribing this circumstance to the excessive heat of the sun at this season, I made an experiment on one of these large locusts, by exposing it to the sun, which actually killed it in less than an hour. I also found that flies, when exposed in the middle of the day, fell down almost instantly; and that all kinds of insects must either get into some shade, or inevitably perish."

91. Gryllus onos: thorax smooth black, grey at the sides; body apertous. Sword of the female as long as the abdomen. Inhabits Siberia.

92. Gryllus ephippiger: thorax elevated behind; wing-cases short and vaulted. Antennae thrice as long as the body; head green, grey behind; thorax brown, the sides whitish before; abdomen brown, as long as the abdomen. Inhabits Surinam.

93. Gryllus medius: wing-cases very short, vaulted, whitish; front black dotted with ferruginous. Antennae black, as long as the body; thorax tefaceous, black at the sides, grey yellow beneath. Inhabits Europe.

94. Gryllus dubius: thorax smooth, rounded behind; wing-cases very short, whitish at the tip; head whitish. Antennae brown, pale at the base, as long as the body; thorax brown, the sides whitish before; abdomen brown, with two lines of ferruginous dots on the back; legs grey, the hind-knees black. Inhabits Italy.

95. Gryllus ferracaudus: green; thorax with a lateral ferruginous line; wing-cases very short, sword recurved at the tip. Wings of the male reticulate, brown, ovate, small, the thicker edge pale towards the base. Inhabits Siberia.

96. Gryllus glaber: brown; thorax subdpressed, very smooth; wing-cases green in the middle, spotted with brown. Inhabits Germany.

97. Gryllus indicus: green; front obtuse, conic; thorax elevated behind and before, hollowed in the middle; abdomen and under-wings brown. This species inhabits India. See Plate II. fig. 10.

98. Gryllus leucolophilus: brown-tefaceous; wing-cases edged and spotted with yellow; thighs with clear white dot at the juncture. Inhabits Europe.

99. Gryllus fuscinus: thorax rounded; sword deep black. Inhabits Germany.

100. Gryllus palpatus: apertous, brown-tefaceous; anterior feelers and hind-legs very long. Inhabits Sicily.

101. Gryllus latifrons: thorax rounded, spotted; wings rounded; antennae very long. Refembles G. viridilimbus; wing-cases very short. Inhabits Europe.

102. Gryllus fuscatus: wing-cases green, shorter than the wings; antennae very long; sword infefted ferruginous. Inhabits Germany and Siberia.

103. Gryllus pedo: funder, fott; hind-legs long and very slender. Inhabits Siberia.

104. Gryllus flavescens: yellowish; wing-cases red; distinculate with black; sword yellowish-black. Eyes blue; sword of the female ascending. Inhabits Germany.

105. Gryllus bipunctatus: brown; sword and two dots on the thorax black; wing-cases yellowish tefulate with black, shorter than the wings. Inhabits Germany.

106. Gryllus marginatus: green, variegated; thorax edged with yellow. Inhabits Germany.

107. Gryllus rubicundus: head and thighs reddish with blue scales. Inhabits Germany.

108. Gryllus rufigipes: green; legs red; sword and protuberances on the thighs brown. Inhabits Germany.

109. Gryllus flavescens: yellowish; wings greenish; sword deep black. Inhabits Germany.

110. Gryllus cinereus: grey; head and two bands on the thorax black; female apertous; antennae very long. Inhabits Sweden.

111. Gryllus cornutus: green; thorax rounded; crown horned, rugged; thighs very tefaceous; antennae tefaceous, shorter than the wing-cases. Inhabits Surinam.

112. Gryllus tuberculatus: thorax flatish; crown tuberculate, smooth; wing-cases long, narrow; antennae tefaceous, as long as the wing-cases. Inhabits Surinam.

113. Gryllus curvicaudus: green; thorax quadrangular, flat; wing-cases elongated, shorter than the wings; hind legs very long. Inhabits Pennsylvania.

114. Gryllus vulturinus: thorax angular smooth; fore-thighs unarmed; spot on the front and bands on the abdomen beneath black; antennae thrice as long as the body. Inhabits Surinam.

115. Gryllus faesius: thorax rounded; thighs round, long, the middle pair unarmed; wing-cases lanceolate; antennae very long. Inhabits Surinam.

116. Gryllus capitatus: head large; thorax flat; smooth, with two black stripes; wing-cases as long as the abdomen.

117. Gryllus spinicron: thorax flatish, smooth; crown spiny; front black; body rufous-brown; wing-cases pale purple green. Inhabits Surinam.

118. Gryllus agilis: grey-green; abdomen brown; thorax flatish; hind-legs and antennae very long; wings longer than the wing-cases. Inhabits Pennsylvania.

119. Gryllus fuscinus: green; abdomen with sulphur and brown bands; thorax flatish; wings longer than the wing-cases; hind-legs very long. Inhabits Pennsylvania.

120. Gryllus tenis: livid-yellow; eyes very large; wings longer than the wing-cases; fore-legs spineless. Inhabits Surinam.

121. Gryllus
Species of the fourth and fifth Divisions of Locusts.

London. Published as the Act directs. Done at Pikes, by J. Fuller.
GRYLLUS.

125. Gryllus pullicornis: varied with brown and cinereous; antennae yellowish, as long as the body; thorax rounded, tesselaceous; abdomen tesselaceous, green at the back, yellow at the front, with an oblique row of pale dots; sword ascending, four-valved. Inhabits Europe.

126. Gryllus longicornis: thorax rounded, tesselaceous above; head green; front pointed, tesselaceous; antennae very long; wing-cases tesselaceous, half as long as the abdomen; sword ascending, tesselaceous, green at the back, yellow at the front. Inhabits Europe.

V. GRYLLUS. Antennae filiform; feelers simple; tail simple; throat with a horn-like protuberance. In this division we have the most formidable of the real locusts. The annals of most of the warm countries are filled with accounts of the devastations produced by locusts, who sometimes make their appearance in clouds of vast extent. They seldom visit Europe in such numbers as formerly; yet in the warmer parts of it are not unfavourable to their production; so that, in the beginning of April, their numbers were so vastly increased, that, in the heat of the day, they formed themselves into large swarms that appeared like clouds, and darkened the sun. In the middle of May they began to disappear, retiring into the plains to deposit their eggs. In June the young brood began to make their appearance, forming very long lines in several hundred yards square; which afterwards marching forward, climbed the trees, walls, and houses, eating everything that was green in their way. The inhabitants, to stop their progress, laid trenches all over their fields and gardens, which they filled with water. Some placed large quantities of heath, flammable, and such like combustible matters, in the trenches, and kindled fire on the approach of the locusts. But all this was of no purpose; for the trenches were quickly filled up, and the fires put out by the great numbers of swarms that succeeded each other. A day or two after one of these was in motion, others that were just hatched came to glean after them, gnawing off the young branches, and the very bark of the trees. Having lived near a month in this manner, they arrived at their full growth, and threw off their worm-like state, by casting off their skins. To prepare themselves for this change, they fixed their hinder part to some bush or twig, or corner of a stone, when immediately, by an undulating motion used on this occasion, their heads would first appear, and a mummied and languishing condition; but as soon as the sun and air had hardened their wings, and dried up the moisture that remained after casting off their skins, they reappeared in full force, and the victor devours the vanquished. They are the prey, too, of serpents, lizards, frogs, and carnivorous birds. They have been found in the stomachs of the eagle and different kinds of owls. They are also used as food by the Moors; who go to hunt them, fry them in oil or butter, and sell them publicly at Tunis and other places.

From a paper published in the 18th vol. of the Philosophical Transactions, we find, that in the year 1693 some swarms of locusts settled in some parts of Wales. Two vast flights were observed in the air not far from...
the town of Dol-galken in Merionethshire; the others fell in Pembrokeshire. From a letter published in the 38th volume of the same work, it appears that some parts of Germany, particularly in the March of Brandenburgh, &c. suffered considerable injury from the depredations of these animals. They made their appearance in the spring of the year 1732, from flights which had deposited their eggs in the ground the preceding year. They attacked and devoured the young spike of the wheat, and this chiefly by night, and thus laid waste many acres at a time beyond all hope of recovery. In the 46th vol. of the same Transactions, we find a description of the ravages of these animals in Wallachia, Moldavia, Transylvania, Hungary, and Poland, in the years 1747 and 1748.

The first swarms entered into Transylvania in August 1747; these were succeeded by others, which were so surprisingly numerous, that when they reached the Red Tower, they were full four hours in their passage over that place; and they flew so close that they made a sort of noise in the air by the beating of their wings against one another. The width of the swarm was some hundreds of fathoms, and its height or density may be easily imagined to be no less. As they approached, they hid the sun, and darkened the sky, even to that degree, when they flew low, that people could not know one another at the distance of twenty paces; but, whereas they were to fly over a river that runs in the valleys of the Red Tower, and could find neither resting-place nor food; being at length tired with their flight, one part of them lighted on the unripe corn on this side of the Red Tower, such as millet, Turkish wheat, &c. another pitched on a low wood, where, having miserably wasted the produce of the land, they continued their journey, as if a signal had actually been given for a march. The guards of the Red Tower attempted to stop their irruption into Transylvania by firing at them; and the swarms charged with such success that swept through the whole place of residence, they seem to tend to warmer climates.

Different methods are to be employed against them, according to their age and state; for some will be effectually stopped as soon as they are hatched; others when they begin to crawl; and others, in fine, when they are going to fly; and experience has taught us here in Transylvania, that it would have been of great service to have diligently fought out the places where the females lodged; for nothing was more easy than carefully to visit those places in March and April, and to destroy their eggs or young worms with salt or burnt salt. If the swarms reach the Red Tower, such as millet, Turkish wheat, &c.; and thus crush the locust with the produce of the land. Finally, when the corn is ripe, or nearly so, we have found, to our great loss, that there is no other method of getting rid of them, or even of diminishing their numbers, but to surround the piece of ground with a mulberry or blackthorn hedge; or if they scatter to a great distance they may be thrown to the ground from the top of a high wall, or shot with a blowgun. When they are driven into a walled piece of ground, they are to be beat with sticks or clubs; and if they gather together in heaps, draw or scatter the litter may be thrown over them and set on fire. Now this method seems rather to lessen their numbers than totally destroy them; for many of them lurk under the grass or thick corn, and in the furrows of the ground, from the sun's heat; wherefore it is requisite to repeat this operation several times, in order to diminish their numbers, and consequently the damage done by them. It will likewise be of use, where a large troop of them has pitched, to dig a long trench, of an ell width and depth, and place several persons along its edges, provided with brooms and such like things, while another numerous set of people form a semicircle that takes in both ends of the trench, and accompanies the locusts, and by making the noise above-mentioned, drive them into the trench, out of which if they attempt to escape, those on the edges are to sweep them back, and then crush
given life to his offspring at the expense of his own. The female, disembarraffed, though not without violent struggles, spends the remainder of her days in some solitary place, busy in forming a retreat under ground, where she can secure her eggs, of which she generally lays about forty, secreting them by her fagacity from the immediate danger of the plough or the fpade, one fatal blow of which would destroy all the hopes of a rising generation.

"They locusts seem to devour, not so much from a ravenous appetite, as from a rage of destroying every thing that comes in their way. It is not surprising, therefore, that, if they should be fond of the moft juicy plants and fruits, such as melons, and all manner of garden fruits and herbs, and feed also upon aromatic plants, such as lavender, thyme, roemenary, &c., which are fo common in Spain, that they serve to heat ovens: but it is very singular, that they equally eat mustard-seed, onions, and garlic; may even hemlock, and the moft rank and poisonous plants, such as the thorn-apple and deadly nightshade. They will even prey upon crowfoot, whose flavour is very pleasant, and such is their universal taste, that they do not prefer the innocent mallow to the bitter furze, or rue to wormwood, consuming all alike, without predilection or favour, with this remark, however, that during the four years they consumed such havoc in Estremadura, the love-apple, or Misophrapcfolium of Linnaeus, was the only plant that escaped their rapacious tooth, and claimted a respect to its root, leaves, flowers, and fruit. Naturalists may search for their motives, which I am at a loss to discover; but, I may say, that, if I was able to obtain any satisfaction in the business, it would be the most difficult to the nature of such a phenomenon, I examined the stomach of the locust, but only found one thin and soft membrane, with which, and the liquor it contains, it destroys and dissolves all kind of substances, equally with the most caflious and venomous plants; extracting from them a sufficient and salutary nourishment.

As an appendix to the foregoing account, it is added by a correspondent from Vienna, that, "a considerable number of locusts had also come within twenty leagues of that city, and that one column of them had been seen there, which was about half an hour's journey in breadth, but of such a length, that, after three hours, though they seemed to fly fast, one could not see the end of the column."

In 1754, 5, 6, and 7, great devastations were committed in Spain by a species of locusts, of which we have the following description by don Guillermo Bowles, published in Dill's Travels through that country, who says, "The locusts are continually seen in the southern parts of Spain, particularly in the pastures and remote uncultivated districts of Estremadura, but in general are not taken notice of, if not very numerous, as they commonly feed upon wild herbs, without preying upon gardens and cultivated lands, or making their way into houses. The peafants look at them with indifference while they are seeking in the field, neglecting any measure to destroy them till the danger is immediate, and the favourable moment to remedy the evil is elapsed. Their yearly number is not very considerable, as the males are far more numerous than the females. If an equal proportion were allowed only for ten years, their numbers would be so great as to destroy the whole vegetable kingdom. In 1754, their increase was so great from the multitude of females, that all La Mancha and Portugal were covered with them and totally ravaged. The horrors of famine were spread even farther, and afflicted the fruitful provinces of Andalusia, Murcia, and Valencia.

The authors of these creatures are objects of surprise and astonishment, and their union is such that it is difficult to separate them. When this separation is voluntary, after having lasted some hours, they are so exhausted, that the male retires immediately to the water for refreshment, where, losing the use of his limbs, he becomes a prey to the fish; having

"The amours of these creatures are objects of surprise and astonishment, and their union is such that it is difficult to separate them. When this separation is voluntary, after having lasted some hours, they are so exhausted, that the male retires immediately to the water for refreshment, where, losing the use of his limbs, he becomes a prey to the fish; having
wings from the dampness of the night, the females seem unusually at the forwardness of the males, who continuing their pursuit, they rise together five hundred feet high, forming a black cloud that darkens the rays of the sun. The clear atmosphere of Spain becomes gloomy, and the finest summer day of Ésframadura more dismal than the winter of Holland. The fluttering of so many millions of wings in the air, seems like the trees of a forest agitation by the wind. The first direction of this formidable column is always against the wind, which if not too strong, the column will extend about a couple of leagues. The locusts then make a halt, when the most dreadful havoc begins; their sense of smell being so delicate, they can find at that distance a corn-field or a garden, and after depositing their eggs, rise again in pursuit of another; this may be said to be done in an instant. Each seems to have, as it were, four arms and two feet; the males climb up the plants, as sailors do the shrouds of a ship, and nip off the tenderest buds, which fall to the females below.

Many old people assured me, when so much mischief was done in 1754, it was the third time in their remembrance, and that they always are found in the pastures grounds of Ésframadura, from whence they spread into the other provinces of Spain. They are certainly indigenous, being of a different shape from those of the North or the Levant, as is evident in comparing them with such in the cabinets of natural history. The locust of the only one that has a rose-colour; besides, it is impossible they can come from any other part. From the north it is clear they do not, by the observation of so many ages; from the south they cannot, without crossing the sea, which is hardly possible by the shortest of their flight, and, like birds of passage, they would be known. I once saw a cloud of them pass over May 25, and flew towards the sea, and go on. When about a quarter of a league, to the great joy of the inhabitants, who concluded they would soon be drowned; but, to their disappointment, they suddenly veered about towards the coast, and pitched upon an uncultivated place surrounded with vineyards, which they soon after quit. When once they appear, let the number be ever so great, the proportion remaining is still too considerable; therefore, the only way to put an end to such a calamity, is to attack them beforehand, and destroy their eggs, by which means they might be totally extinguished."

127. Gryllus elephas: thorax carinate, entire; body aperous. Inhabitst Africa.

129. Gryllus acridius: thorax crested, with a four-cleft ridge; wings variegated, brown at the lower margin. This is one of the largest species of locust yet known; and, together with some others of the larger kind, is made use of in some parts of the world as an article of food: they are eaten both fresh and salted, in which last state they are publicly sold in the markets of some parts of the Levant. The quantity of edible sub stance they afford is but small, especially in the male insects; but the females, on account of the ovaries, afford a more nutritious sufficiency. It is well known that different interpretations have been sometimes given of the passage in the sacred writings in which John the Baptist is said to have fed on locusts and wild honey; and the word ἄγριας has been supposed to mean the young shoots of vegetables rather than locusts; but, since the fact is established, that these insects are full eaten by the inhabitants of the East, there seems not the slightest reason for adoption in preference than the usually received one. Why should we wonder that the abominable prophet, during his flate of solitary seclusion from the commerce of the world, should support himself by a repast which is to be numbered, not among the luxuries of life, but merely regarded as a subltitute for food of a more-agreeable nature? We may also adduce in support of this idea the testimony of Hal floqvit, who thus expresses himself on this very subject: "They who deny insects to have been the food of this holy man, urge, that this insect is an unaccustomed and unnatural food; but they would soon be convinced to the contrary, if they would travel hither, to Egypt, Arabia, or Syria, and take a meal with the Arabs. Roasted locusts are at this time eaten by the Arabs, at the proper season, when they can procure them; so that in all probability this dish had been used in the time of St. John. Ancient customs are not here subject to many changes, and the virtuous of St. John are not believed to be unnatural here; for he was afforded by a judicious Greek priest, that his church had never taken the word in any other sense; and he even laughed at the idea of its being a bird or a plant."

The gryllus acridius above-mentioned is a highly beautiful animal; being of a bright red, with the body annulated with black, and the legs varied with yellow; the upper wings tingled with alternate variegations of dark and pale green; the lower with transverse undulated streaks. The length of the animal from head to tail is about four inches; and the expanse of wings from tip to tip, when fully extended, hardly less than seven inches and a half.

130. Gryllus dux: thorax carinate, rough; wings variegated green; lower wings rufous, spotted with blackish brown. Antenna black; head yellowish; thorax greenish, with pale raised dots; wing-cases with yellow nerves; hind-margin of the wings brown; body and legs greenish. Inhabitst South America. Plate II. fig. 12, flies the perfect animal; fig. 13, the larva.

131. Gryllus carina: thorax carinate, with a trifid crest; wings with a black band. Thorax rough; wing-cases greenish; hind-thighs carinate each side, rough, and reticulate with raised lines; thanks very spious. Inhabitst the East.

132. Gryllus lunus: fegments of the thorax with a semi-ovibicular crest; wing-cases black, with white bands. Inhabitst South America.

133. Gryllus reticulnris: thorax boat-shaped, length ened and acute behind; wing-cases reticulate. Head ferruginous; mouth spotted with black; antennae ferruginous, the frst and last joints black; thorax with a trifid crest, ferruginous, the keel and abbreviated lateral line black; wing-cases black, reticulate with yellow; legs black, rufous beneath; antennae ferris spots; thanks very spious. Inhabitst South America.

134. Gryllus gallinaeucus: thorax boat-shaped, very large, lengthened at each end; and with the wing-cases brown, immaculate; hind-thighs carinate each side, rough; wing-cases with raised lines; thanks very spious. Inhabitst South America.

135. Gryllus ferripes: thorax boat-shaped, lengthened behind; wing-cases brown; hind-thighs ferrise. Antenna very short, brown; thorax composed, covering the head and more than half the body; wing-cases flexuous at the outer margin; wings yellowish, pointed, brown at the tip; fore-thighs channelled beneath; hind-thighs ferrise; antennae ferrise spots; the spine at the base larger and membranaceous. Inhabitst East India.

137. Gryllus turcicus: thorax boat-shaped; body cinereous; wing-cases with a brown band and base; wings cinnereous. Inhabitst the thalassic teffaceous; legs cinnereous. Inhabitst India; small.

138. Gryllus milliarius: thorax nearly square, warry; wing-cases with white callous dots. Scutel roundcd, toothed at the edge. Inhabitst America.
with black; legs pale; thighs dotted with black with greenish; body black; the edges of the segments red; edged round with yellow; wing-cases green, dotted with yellow. Head pale, spotted with black before; antennae fringed with spines behind. Inhabits Senegal. Size of G. miliaris.

143. Gryllus scabiosus: thorax square, warty, black edge round with yellow; wing-cases green, dotted with yellow. Head black, with a broad yellow crown reaching to the edge of the thorax each side; wing-cases greenish; body black; the edges of the segments red; breal spotted with red; legs black; hind-thighs with a yellow line each side. Inhabits Tranquebar. Size of the last.

144. Gryllus squarrosum: thorax three-jointed, the joint segments each side; wing-red, dotted with black. Head and thorax with two-spined, the hind spine tricuneate, second joint with a tricuneate spine, the third with many spines; wing-cases green, dotted with brown. Inhabits Africa. See Plate III. fig. 15.

145. Gryllus squamulatus: thorax subcarinate, rough; head obtuse; thighs ciliate with hair. Wing-cases cinereous, with a yellow line or two; wing-cases reticulate with black veins. Inhabits India.

146. Gryllus flavicornis: thorax subcarinate, green; wing-cases immaculate; wings rufous at the base; hind-thanks fanguineous, furrate with yellow. Inhabits China. Large.

147. Gryllus flavidus: thorax subcarinate, grey; wings yellowish at the base, with an abbreviated brown band at the tip and brown dots. Head and thorax with a yellow line or two; wing-cases grey, or varied with cinereous and black; hind-thanks spiny, fanguineous tip with black. Inhabits Tranquebar.

148. Gryllus pictus: wing-cases green, dotted with white. Head pointed. In Egypt yet roof the tip; body variegated with blue and yellow. Antenna blue, with three yellow rings: head blue, with fix yellow lines; thorax blue, spotted with yellow; abdomen annulate with yellow and blackish; wings red; fore-legs varied with yellow and blue; hind-thighs blue, with two yellow streaks at the tip; hind-thanks yellow. Inhabits Cayenne.

149. Gryllus tartinarius: thorax with two segments; front impressed; mandibles the colour of the body. Wing-cases pale ash-colour, spotted with brown. Inhabits Africa.

150. Gryllus migratorius: thorax subcarinate, of a fingle segment; mandibles blue. Inhabits Tartary, and migrates in incredible swarms into various parts of Europe. The mischief these voracious creatures do, when they appear in vast legions, far exceeds the calamities occasioned by any other tribe of animals. By suddenly destroying all vegetation, they change the most fertile provinces into barren deserts, leaving behind them defolation, and famine, and diseases. They have occasionally appeared in such swarms in England, but have never virthed in a short time. This was probably the species which constituted one of the plagues of Egypt. Numbers, ch. x. Niebuhr speaks of them as follows: "In Egypt I saw once a cloud of locusts, which was brought by a south wind from the deserts of Libya; the locusts fell in prodigious quantities on the roofs of the houfes, and in the streets of Kahira. A few more of them, till at Jidda, in November 1762, a large cloud of locusts was driven over the city by a west wind. The cloud came from the other side of the Arabic Gulf; and, therefore, many of the insects must have been drowned in their passage. In the month of July following, we found a small quantity near mount Sumeria, which seemed to have been the scene in Arabia. These swarms often cross the Red Sea a second time, and return to Egypt, the upper part of which, adjoining to the deferts of Libya, seems to be the cradle of these animals. I saw clouds of them in Persia, and Syria; where, in the quarter of Moful, I found nets of these insects, which a careful police might in a great degree defend all locusts, of the size of a fly, and with amazing rapidity, and attain their natural size within a few days. There are undoubtedly various species of this insect, which have not as yet been sufficiently discriminated. Mr. Forfkal calls the locust which infests Arabia gryllus gregarius, and thinks it to be different from that which is called by Linnaeus gryllus migratorius, and which is a native of the deserts of Tartary, from which it passes through the neighbouring countries, into Poland and Germany. The gregarius merits this denomination; for the locusts of this species appear to act in concert, and to live and travel in society. Those which remain after the departure of the great body are only irregular stragglers. The Arabsians differing from several species of this insect, give particular names. But these names are not expressive of any qualities in the nature of the animal; as they respect only the delicacy ascribed to its flesh. They give the name mukan to the red locust, which is esteemed fatter and more succulent than any of the others; they likewise eat the light locust; but abstain from another, called dabaim, because it has a nature tendency to produce diarrhoea. All Arabsians, whether living in their native country, or in Persia, Syria, and Africa, are accustomed to eat locusts. The Turks, on the contrary, have an aversion for this sort of food. If the Europeans express any thing of the same aversion, the Arabsians then remind us of our fondness for oysters, crabs, and lobsters. A German, who had long resided in Barbary, affirmed us, that the flesh of this insect tasted like the small Service of the Baltic Sea, which is dried in some towns of Holstein. We saw locusts caught, and put into bags, or on ftrings, to be dried, in several parts of Arabia. In Barbary, they are boiled, and then dried upon the roofs of the houses. The Arabsians and Europeans eat them raw with the utmost voracity. We saw no infance of unwholesomeness in this article of food; Mr. Forfkal was indeed told, that it had a tendency to thicken the blood, and to bring on melancholy habits. The Jews in Arabia are convinced, that the fowls, of which the Israelites ate so largely in the defert, were only clouds of locusts; and laugh at our translators, who have supposed that they found quails where quails never were. The swarms of these insects darken the air, and appear at a distance like clouds of smoke. The noise they make in flying is frightful and stunning, like that of a water-fall. When such a swarm alights upon a field, it is wasted, and then dried upon the roofs of the houses. The Befins of Egypt yet roof the tip of the body variegated with blue and yellow. Antenna blue, with three yellow rings: head blue, with fix yellow lines; thorax blue, spotted with yellow; abdomen annulate with yellow and blackish; wings red; fore-legs varied with yellow and blue; hind-thighs blue, with two yellow streaks at the tip; hind-thanks yellow. Inhabits Cayenne.

151. Gryllus rufofemus: thorax black on the back; with a yellow keel; antennae and thanks yellow. Antennae reddish; head grooved, brown; thorax of three Q segments;
Gryllus

155. Gryllus nervosus: greenish; thorax black on the back, with a yellow line; wing-cases greenish, with a yellow or greenish submarginal nerve. Antennae short, yellow or ferruginous; head greenish, grooved each side; hind-thanks ferruginous at the tip. Inhabits Guinea; less than G. migratorius.

156. Gryllus lucidus: thorax subcarinate; black; spot on the thorax and behind the abdomen fuscous, yellow at the base. Inhabits New Holland.

157. Gryllus nubicus: thorax carinate; wing-cases black, with a white band, behind grey varied with brown. Head brown, pale at the sides; mandibles black; hind-thanks fuscous, yellow at the base. Inhabits New Holland.

158. Gryllus tuberculatus: thorax rough; wings red, cinereous at the tip; hind-thanks carinate above and beneath. Wing-cases clouded with brown and cinereous; hind-thanks brown; yellow. Inhabits sandy places of Jutland.

159. Gryllus ciliatus: thorax rough, the crest bident; wings red, with a black band; hind-thongs channelled. Antennae yellowish; head black, varied with brown, white at the base; thorax varied with cinereous and brown, with raised dots; wing-cases varied with cinereous and brown; wings black at the base; hind-thangs variegated without, with a yellowish, with a large black spot at the base, and fuscous at the sides; thanks fuscous. Found on the Citrus halimifolius. Inhabits Africa.

160. Gryllus fridulius: thorax carinate; wings red, black on the outer part. Inhabits Europe.

161. Gryllus morio: thorax subcarinate; body dusky; wings black, fuscous. Body sometimes varied with green; hind-thanks yellowish, tip with black; thanks fuscous fuscous, yellow at the base. Inhabits Africa; less than G. migratorius.

162. Gryllus ferruginous: thorax tuberculate; wing-cases dusky, immaculate; wings fuscous. Head pointed. Antennae black, with yellow tips; mouth brown, with red spots; crown and yellow; thorax yellow at the base; inner margin of the wings cinereous at the tip; abdomen annulate with brown and yellow; heads with black and white; hind-thanks ferruginous. Inhabits Italy; twice as large as G. flavus.

163. Gryllus fulphecus: thorax carinate; body dusky; wings yellow, blackish at the tip. Head, thorax, and wing-cases, dull ferruginous, the latter somewhat cinereous at the tip; hind-thangs within annulate with yellow and brown, black and black; thanks blue, pale at the base. Inhabits America; small.

164. Gryllus flavus: thorax carinate; wings yellow, with a black band, cinereous at the tip. Antennae short; yellowish; head obtuse, black; front with two yellow lines; thorax with a white cross; wing-cases brown, with a whitish band or two at the base; hind-thanks fuscous. Inhabits Africa.

165. Gryllus cyanipes: brown, with a yellow dorsal line; hind-thanks yellow, tip with blue. Antennae yellowish, tip with brown; yellowish dorsal line reaching from the crown to the middle of the wing-cases; wing-cases and wings clouded. Inhabits America.

166. Gryllus fridulius: grey; wing-cases brown at the base, spotted with yellow, the tip varied with cinereous and brown. Thorax brown, with sometimes a yellow dorsal line, and black lateral spots; wings cinereous reticulate with brown. Inhabits America.

167. Gryllus lateralis: thorax brown, with a yellow margin and dot each side; thanks yellow. Wing-cases and wings brownish; all the hind-thanks yellow. Inhabits America.

168. Gryllus velox: thorax flat; body brown; margin of the thorax and legs greenish. Head with a greenish spot under the eyes; wing-cases brown, pale at the tip. Inhabits China; small.

169. Gryllus biguttulus: thorax carinate; wing-cases clouded, edged with yellow, with several whitish marks near the tip. Head and thorax brown, with whitish lines; body and legs dull ferruginous. Inhabits Europe.

170. Gryllus viridulus: thorax cruciate; body above green; margin of the wing-cases whitish. Inhabits Europe.

171. Gryllus griffinus, the grasshopper locust: thorax fuscous grey; wing-cases greenish; antennae cylindrical. Inhabits Europe.

172. Gryllus capitivus: thorax cruciate; body brown; hind-thanks and thanks with a white band. Inhabits New Holland; with black lines; thorax brown, with a white cross; hind-thanks comprized. Inhabits New Holland.
Locusts of the fifth Division.

London: Published as the Act Directs, 1743. Printed by J. Wilkes.
Gryllus.

185. Gryllus apicarius: thorax cruciate; antennae as long as the body. Inhabits dry plains of Europe.

186. Gryllus clavicornis: green, with a black lateral band; antennae elevate. Antennae ferruginous, the club black, comprefsed and tip with white; band reaching from the eye through the margin of the wing-cases to the tip. Inhabits Surinam: size of G. grossus.

188. Gryllus pediferis: body flesh-colour, aperous. Inhabits Europe.

189. Gryllus perspicillatus: rudiments of the wings with an ocellate black spot; eyes golden. Inhabits India: is probably only the larva of some other species.

190. Gryllus infuscatus: wing-cases tfeaceous; wings red at the base, with a black band. Inhabitants Lombardy.

192. Gryllus annulatus: thorax flatfih; front gib¬bucks; wings blue-black; blue within. Antennæ yellowish, annulate with black; body reddish-grey, with raised dots; abdomen with a few green rings. Inhabits America.

193. Gryllus triangulurus: tawny; scutel and triangular spot on the first segment of the abdomen yellow; wing-cases edged with yellow; wings yellowish. Inhabits Germany.

194. Gryllus versicolor: varied with green, red, and yellow; head, antennæ, and edges of the wing-cases, green; thorax and wing-cases brown. Inhabits Lombardy.

195. Gryllus centurio: brown spotted with black; wings deep red, with black base margin, and fine undulate streaks. Shown at fig. 19. Plate III.

196. Gryllus eurexus: green; wings blue, cinereous at the tip; thighs yellow-green; shanks deep black. Inhabits Africa.

197. Gryllus miles, the folder locust: colour green, with two yellow stripes on the head, and two yellow spots on the thorax; elytra sword-shaped; wings with alternate stripes of reddish and black. Inhabits America. This beautiful species is shown at fig. 20. Plate III.

198. Gryllus lumulatus, the lumulated locust: thorax slightly hooded, with three raised lines, the sides lumulate. Inhabits America.

199. Gryllus subcarinatus: thorax subcarinate, greenish; wings yellowish at the base, with a blackish spot at the tip. Inhabits Siberia.

200. Gryllus fulcatus: brown; wing-cases with two white bands. Inhabits the defects of Ural.

201. Gryllus Lepechini: scutel of the thorax as long as the wing-cases, with a white line running from the front through the middle of the scutel. Inhabits Siberia.

203. Gryllus muricatus: thorax pentagonal; wings yellowish, with a brown arch; hind-thighs muricate outwardly. Inhabits the defects of the Ural.

204. Gryllus minutus: thorax subcarinate; wings carmine, with a black arch at the tip. Inhabits the defects of the Ural.

205. Gryllus variabilis: thorax subcarinate; wings reticulate with black, with a black space at the thicker margin, the tip brown hyaline. Wings varying to hyaline, whitish, pale or blueish. Inhabits Siberia.

206. Gryllus falmus: thorax subcarinate; wings with a broad black band, the base rosy, the tip hyaline. Inhabits the faid defects of Ural.

207. Gryllus trilalis: wing-cases clouded; wings blue¬ish, reticulate with brown; shanks whitish, with long spines. Inhabits Siberia.

208. Gryllus barbadensis: wing-cases pale, speckled with brown; wings hyaline, yellowish, the edge and tip with brown veins and dots. Inhabits Siberia.

210. Gryllus cinereus: dotted with brown; thorax subcarinate; wings white. Inhabitants Denmark.

211. Gryllus flavescens: yellowish; wing-cases brownish, obliquely spotted; wings reticulated with yellow and black. Inhabitants Germany.

212. Gryllus ruficollis: wing-cases cinereous, which at the tip, with black rhombic spots. Inhabitants Germany.

213. Gryllus angulatus: yellowish; abdomen brown, the segments of the rings angular. Inhabitants Germany.

214. Gryllus rubricephalus: head, thorax, and anterior margin of the wing-cases, green, the latter with a whitish lunule in the middle; wings cinereous; abdomen behind and legs reddish. Inhabitants Germany.

215. Gryllus pullus: black brown; thorax square, with a yellowish margin. Inhabitants Germany.

216. Gryllus lineatus: green; line down the thorax and future of the wing-cases orange. Inhabitants Germany.

217. Gryllus flammeus: cinereous; wing-cases with two white spherical spots at the base. Inhabitants Germany.

218. Gryllus rubricollis: yellowish; thorax red, edged with yellow. Inhabitants Germany.

219. Gryllus rosaceus: variegate; thorax green, with a rosy margin. Inhabitants Germany.

220. Gryllus similis: thorax subcarinate; wings black, the disc and edge red. Two wings spotted at the tip. Inhabitants Germany.

221. Gryllus purpureus: wings and wing-cases pale spotted; thorax and three first rings of the abdomen purple. Inhabitants Germany.

222. Gryllus flavens: yellowish; thorax with two darker lines. Inhabitants Germany.

223. Gryllus viridis: green, with a yellowish patch behind. Inhabitants Germany.

224. Gryllus fex-maculatus: brownish; wings yellow¬ish, with five brown spots placed in a line. Inhabitants Germany.

225. Gryllus maculatus: wing-cases spotted; wings rosy, pale ash at the tip. Inhabitants Germany.

226. Gryllus polydactis: brownish, with scattered pale dots; wings reddish, the tip and tail blackish. Inhabitants Germany.

227. Gryllus limbatus: green; wing-cases frous at the tip and outer margin. Inhabitants Europe.

228. Gryllus pratenis: green; wing-cases tipt with black; antenæ half as long as the body. Inhabitants Europe.

229. Gryllus albipes: thorax crested, with a quadruple segment; wing-cases dull greenish; wings violet; hind-thighs spotted with white. Inhabitants Surinam.

230. Gryllus rofeus: green; antennæ yellow; half the wings and hind-thongs rosy. Inhabitants China.

231. Gryllus fanguinolentus: head spotted with yellow, red, and black; thorax yellow; wing-cases green; shanks spotted with red.

232. Gryllus denticulatus: green; thorax boat-shaped, carinate, and toothed; head pointed, with two grey stripes. Inhabitants Surinam.

233. Gryllus dentatus: brown, clouded; thorax boat¬ shaped, rugged; the keel smooth; hind-thighs denticulate; head ovate. Inhabitants India.

234. Gryllus chloropterus: brown; wings green; thorax rounded, smooth; hind-thigs with a yellow line. Inhabitants Surinam.

235. Gryllus erythrospus: grey-brown; hind-thighs beneath red, within yellowish spotted with black; hind-thongs red. Inhabitants Pennsylvania.

236. Gryllus chrysopterus: brown; thorax caudate; wing-cases brown, with the inner edge green; wings black, yellow at the base. Inhabitants Pennsylvania.

237. Gryllus varius: dull green; wings blue; body with
with yellow bands and spots; thighs fanguineous at the base. Inhabits Surinam.

238. Gryllus longipennis: yellow green; wing-cafes twice as long as the abdomen; head and thorax with two black bands. Inhabits Surinam.

239. Gryllus acutus: thorax black with a yellow-green spot; wing-cafes brown with a green spot; hind-thighs with three black bands. Inhabits Surinam.

240. Gryllus chalcops: grey-brown; thorax with two black bands; wing-cafes with a grey one; hind-thighs fanguineous and fanguineous. Inhabits Surinam.

241. Gryllus ficticus: grey-brown; wing-cafes with black punctured lines. Inhabits Surinam.

242. Gryllus hamatus: fentinel longer than the abdomen, hooked on the fore-part; antennae as long as the abdomen; wings black, without cafes. Inhabits Surinam.

243. Gryllus rugulosus: apterous; green, variegated with cinereous; head vellar; front with two indented ridges and a smaller denticulate ridge each fide; crown imprefced, the margin rafed, toothed; thorax spinous, the crest rafed, compressed, with indented ridges. Body sometimes cinereous, variegated with brown; segments of the abdomen with a brown spot each fide, two teeth each fide and a toothed crest. Inhabits out of Europe. Gryllus angulatus thorax carinate, with a brown line each fide; with a brown lunule in the middle, anterior margin and three spots near the tip at the hind-marg in; hind-hanks white with black spine.

244. Gryllus flavipes: thorax above and wing-cafes chestnut-brown; the anterior margin green-yellow; hind-thighs beneath fanguineous, yellowish. Inhabits Surinam.

246. Gryllus cruciger: thorax green with a white cross; wing-cafes green on the back, brown tip with white, the edge infleced. Inhabits Europe.

247. Gryllus viridus: thorax crusiate, above green, with a broken white line each fide; wing-cafes clouded with brown, above green. Inhabits Europe.

248. Gryllus virvens: green; cruciate; antennae longer than the body. Inhabits Europe.

249. Gryllus venulosus: thorax cruciate, rufeous; wing-cafes hyaline with rufeous veins. There is a variety in which the wing-cafes have fix brown spots. Inhabits Europe.

251. Gryllus distinctus: apterous, green; female greenish on the back; male with the hind-thighs greenish. Inhabits Europe.

252. Gryllus flufius: thorax carinate, green, with rufous illuftrative notes to the works of Eufebius, Origen, and John Epiftolus in the books of Aristotle, on Jufin, on Julius Pollux, &c.

GRYNEUS (John-James), grand-nephew of the preceding, born at Bern in 1540. After having been instructed in classical learning by his father, he profeeded to his academical studies at Bafil, with commendable diligence; and, in 1559, was ordained deacon, in which capacity he officiated at Rotelen till the year 1563, when his father was nominated pastor of the church in that town. He now went for farther improvement to Tubingen, where in 1564, he was admitted to the degree of doctor of divinity. In the following year he succeded his father as pastor of Rotelen, where he chiefly divided his time between the duties of that office and the superintendence of the churches in the marquifate of Baden, to which a penfion was annexed by the margrave. In 1579, he accepted the chair of profeffor of the Old Teftament at Bafil, which he filled for nine years with great celebrity, during which period he gained a number of profeftes and patrons to the theological fyltem of the reformed church.

In the mean time he furnished the heads of the churches in the marquifate of Baden, to which a penfion was annexed by the margrave. In 1584, after the reformation of the difcipline of the reformed church in the palatinate by the elector John Cafimir, he was prevailed upon to remove to Heidelberg, where for nearly two years he filled the poft of profeffor of his own order and the superintendence of the fchools, to which charge were connected thofe of profeftor of literature. He returned to Bafil, however, in 1586; where, during his abfence, he was chosen principal minifter of the city, upon the death of Sulzer; with which charge were connected thofe of profeffor of hiftory and theology in the university. He conducted himself in these employments greatly to the fatisfaction of the church at Bafil, as well as to the improvement of thofe who fimulated under him. For the laft five years of his life he was totally blind, in confequence of the inftivity with which he had applied to his literary and professional labours. He died in 1617, in the fifty-seventh year of his age. He was the author of numerous illuftrative notes to the works of Eufebius, Origen, and John Epiftolus; also of the "Outlines of Theology: 3. Expofitions of some of the Psalms, and of the prophecies of Haggai, Jonah, Habakkuk,"
bakkuk, Obadiah, and the first five chapters of Daniel.

GRYNAU, a town of Switzerland, in the canton of Glarus, situated on the lake of Zurich: three miles west of Zurich.

GRYNEUM, or GRYNIUM, in ancient geography, a town near Clazomenae, where Apollo had a temple with an oracle, on account of which he is called Grynaus. Strabo.

GRYPHITES, a natural history, the crow's stone, an oblong fossil shell, very narrow at the head, and becoming gradually wider to the extremity, where it ends in a circular limb; the head or beak is hooked, or bent inward. They are found in our gravel or clay pits in many counties.

GRYPHIIUS (Christian), a celebrated writer, born at Frauenstadt in Silezia, in 1649. His father, Andrew, was a celebrated German dramatic writer. Christian began his education at Breslau, in which he was made principal and professor of the Magdalen college, in the same city, in 1686, and afterwards librarian. He was a man of very extensive erudition, and possessed a number of languages, ancient and modern. He died in 1706, having, just before he expired, caused to be performed in his chamber a piece of poetry of his own composition, expressive of the consolation received by the dying from meditating on the death of Christ. His principal works are, 1. Poems in German, 8vo. much esteemed. 2. A History of the Orders of Knighthood, in German, 8vo. 3. A Treatise on the Origin and Progress of the German Language, 8vo. 4. Dictionarium de Scriptoribus Hijloriam Saculi XVII. illustrantibus, 8vo. He died in 1706, having, just before he expired, caused to be performed in his chamber a piece of poetry of his own composition, expressive of the consolation received by the dying from meditating on the death of Christ. His principal works are, 1. Poems in German, 8vo. much esteemed. 2. A History of the Orders of Knighthood, in German, 8vo. 3. A Treatise on the Origin and Progress of the German Language, 8vo. 4. Dictionarium de Scriptoribus Hijloriam Saculi XVII. illustrantibus, 8vo. He died in 1706.

GRYPHIIUS (Sebastian), a learned printer of the sixteenth century, native of Reutlingen in Swabia. He settled at Lyons, and obtained great reputation for the beauty and accuracy of his imprints. He was himself well acquainted with the learned languages, and employed men of erudition as his correctors. Conrad Grefen and Julius Scaliger have both addressed him in terms of great commendation. One of his finest books is a Latin Bible, in two volis. folio, 1550, printed in the largest types then seen. He also printed Greek and Hebrew excellently. He died in 1556, at the age of sixty-three. His son Antony, who succeeded him, supported the whig party.

GRYPHIIUS, [γρυφυ], Gr. from γρυφυ, to incurvatur.] An instrument bent like a griffin's talons for extracting a mole from the uterus.

GRYPHYUS, s. A kind of riddle, an enigma. Not much used.

GYSINGARDE, a town of Norway, in the diocese of Drammen: seventy-six miles south-east of Drammen.

GYSYON, a county of the American States, in Virginia, taken from Montgomery, which bounds it on the north. It has the state of North Carolina south, Henry and Wythe counties on the east and west.

GYSCHWEND, a town of Germany, in the archduchy of Austria: five miles west of Steyr.

GUYVIE, a town of Arabia Felix: sixteen miles south of Loheia.

GUÁ, a town of the island of Cuba: thirty-six miles south-west of Bayamo.

GUÁ (Le), a town of France, in the department of the Lower Charente, and chief place of a canton, in the district of Maremnes: two leagues and three quarters south-east of Maremnes, and four and a half west of Saintes.

GUABIPOCAEBI BA. Ste Mimosa vaga.

GUACA, a village in New Spain, near the mountains Jeryu, which was destroyed by a volcano in that mountain, in 1750.

GUACAPA, a river of North America, in the province of Nicaragua, which runs into the Pacific Ocean.

GUACOCHO, a sea-port of Peru, in the province of Lima, between the island of St. Martin and Callao.

GUACOCINGA, a town of Mexico, in the province of Tlaixa, containing about six hundred inhabitants, among which are one hundred Spaniards.

GUADAADAR, a river of Spain, which runs into the Guadalentin at Lorca.

GUADAGNOLI (Philipp), an Italian monk and learned oriental scholar, born at Maghano about the year 1596. When sixteen years of age, he entered among the regular clerks minors, and made his profession at Rome in 1612. His genius led him to the study of many languages, to which he devoted himself with such ardour, that he became proficient in the Greek, Hebrew, Chaldee, Syriac, Persic, and Arabic, tongues, but chiefly excelled in the last. He filled with reputation the chair of professor of Arabic and Chaldee in the college of Wifdom; and in proof of his intimate acquaintance with the former language, pronounced an oration there, before queen Christina of Sweden, in 1656. He was made principal and professor of the college de propaganda fide determined to comply with their desire, and fixed upon the archbishop of Damascus, and father Guadagnoli, to undertake that weighty task; but, after a short time, the principal labours of the work devolved on the latter. This grand design almost wholly employed him for twenty-seven years, and was not completed before 1649. The translation made its appearance at Rome in 1671, in 3 vols. folio. In 1631 father Guadagnoli published, Apologia pro Religione Christi et in v. 40. in answer to the objections of Ahmed Ben Abdalhadin. He also wrote a work in Arabic, entitled, Considerations against the Mahometan Religion, which was printed at Rome in 1649, and is employed in showing that the Koran is a mere collection of impostures and falsehoods. Besides the articles above-mentioned, he published at Rome, in 1622, a very methodical grammar of the Arabic language, entitled, Brevis Institutiones Linguarum Arabicarum, folio; and he had also compiled a dictionary in that language, which he left behind him in manuscript. He died at Rome in 1676.

GUADALAIRA, a river of Spain, which runs into the Guadalquivir a little below Seville.

GUADALACAARA, or GUADALAXARA, a province in the audience of Galicia, in Old Mexico or New Spain, and its capital, and chief city of the province, both large and beautiful. The city was built anno 1531, by one of the family of the Guzmans; and the bishopric, which was before settled at Compostella, was translated thither in 1570. It is situated on a delightful and fertile plain, watered with several streams and fountains, not far from Baraana river. The air of the country is temperate, and the soil to fertile, that it yields one hundred to one; and all the fruits of Europe grow in luxuriance and abundance. Lat. 20. 30. W. lon. 104. 49. The province is watered by the Guadalaxara river.

GUADALAJARA, a town of Spain, in New Castile, situated on the Harena, containing nine parish churches, fourteen convents, several hospitalls, and hardly three thousand inhabitants. The duke of Riplestadvertised a linen manufacure, which has not the substance of the cloth made in Holland, but the colour is good: twenty-two miles east of Madrid. Lat. 40. 35. N. lon. 13. 14. E. Peak of Teneriffe. GUADALAJARA, a town of Spain, which runs into the sea between Gibraltar and Marbella.

GUADALAJARA DE BUGA, a town of South America, in the province of Popayan; twelve leagues north-west of Popayan.
GUADALAVIAR, a river of Spain, which runs into the sea near Valencia.

GUADALAXARA, or GREAT RIVER, in Mexico or New Spain, rises in the mountains of the valley of Tolocan, where stands the city of Guadalajara, or Guadalacan, the capital of New Galicia. After running a course of more than six hundred miles, it empties into the Pacific Ocean in the 25th degree of north lat. It has stupendous falls, fifteen miles south of the city of its name.

GUADALBU'RON, a river of Spain, which runs into the Guadalquivir a little above Andujar.

GUADALCANAL, one of the Islands of Solomon, in the Southern Pacific Ocean.

GUADALCAZAR, a town of Spain, in the province of Eftremadura, in the mountain of Morena: ten miles south of Llerena.

GUADALEN'TIN, a river of Spain, which empties itself into the Gulf of Carthagena, at Almacaren.

GUADALETE, a river of Spain, which runs into the sea at Cadiz.

GUADALIX, a town of Spain, in New Castile: twenty-two miles north of Madrid.

GUADAR, a river of Spain, which runs into the sea near Vera in Murcia.

GUADALMEDENA, a river of Spain, which runs into the sea near Malaga.

GUADALOUPE, a river of Spain, which runs into the Ebro, at Caspe, in the province of Aragon.

GUADALOUPE, a river of Spain, which runs into the province of Eftremadura.

GUADALOUPE, or GUADALOUPE, an island of the West Indies, and one of the largest of those called the Leeward Islands: about two hundred and fifty miles in circumference. It is divided into two parts by a channel, about a league and a half over, called the Salt River, navigable only for canoes, which runs north and south, and communicates with the sea on both by a large bay at each end, of which that on the north is called Grand-Cul de Sac; and that on the south Petit Cul de Sac. The cau part of the island is called Grande Terre, and is about nineteen leagues from Antigua point on the north-east to the point of Guadaloupe on the south-east; and about nine leagues and a half in the middle, which, with this part, makes a figur six leagues in circumference. The whole part, which is properly Guadaloupe, according to Laet, is subdivided by a ridge of mountains into Cape-terre on the west, and Bassi-terre on the east. This is twelve leagues from north to south, and seven and a half miles west and east; and about forty leagues in circuit. Both parts would be joined by a channel, between the Ebro and a half in breadth, were it not cut through by the river. Labat says that the French were obliged to abandon Grand-terre in 1696, by reason of the frequent incursions and depredations committed there by the English from Antigua and Montserrat. Besides, this part is deftitute of fresh water, which is so plentiful in the other (properly called Guadaloupe, as having been first discovered and inhabited), that it has enough to supply the neighboring islands. He makes the latter thirty-five leagues in compass, and both islands together about ninety. The Salt-river, he says, is about fifty toises, or three hundred feet, over at its mouth, towards the Great Cul de Sac, from whence it grows narrower, so that in some places it is not above ninety feet over. Its depth is likewise as unequal as its breadth, for in some places it will carry a ship of five hundred tons, and in others hardly bear a vessel of fifty. It is a smooth clear stream, above two leagues from the one Cul de Sac to the other, and finely shaded for the most part with mangroves. The air here is very clear and healthy; and, at most times, as in Martinique, here is also plenty of water, and as good as the soil is rich, which is not inferior to that of Martinique; it is equally cultivated, and its produce is the same with that of Martinique. The French first began to send colonies to Guadaloupe about the year 1652; but made no great figure till the eighteenth century, since the beginning of which it has vastly increased under the French. They have added it with several regular forts. Bassi-terre, which is the capital, is regularly built, and well defended. Point a Pierre is also a neat town with one of the best harbours in the West Indies. The whole island, in 1759, was supposed to contain about twelve thousand whites, and sixty thousand negroes and mulattoes.

This island was first discovered by Christopher Columbus, who gave it the name it now bears, from the resemblance it was supposed to have to the mountain so called in Old Spain. His landing was opposed by the women of the island with their bows and arrows, but they were soon dispersed by the fire-arms of the Spaniards, who obtained an easy possession of the island. They found the houses stored with large quantities of cotton, spun and unspun, and looms for weaving it; mention is likewise made of iron bows and arrows, and cotton hammocks. Among the vegetable productions are the tree which yields the copaiba balsam; the milk-shrub, which yields a balsamic liquor like milk; the copohene-balm tree, yielded by the natives to fatten their hogs; the corbary-tree, which bears a gum similar to amber; a kind of cinnamon-tree, aloes, and sandalwood; indigo, cocoa, coffee, and cotton. Among the birds discovered in the island were parrots, partridges, turtle-doves, herons, and falcons; but the most extraordinary is that called the devil-bird, which is a filthy bird of passage, of the size of a young pullet, with a plumage jet black. The bees are black, small, and without sting; the honey never hards, but is always of the consistence of oil. A flying insect, called, raev, is very troublesome in this island, gnawing paper, books, and furniture, and would be intolerable were it not for a large spider, which entangles them in its web, and otherways destroys them. On a very lofty mountain is a considerable volcano, called the fulphur mountain; and here the Indians who fell brimstone refted in great numbers to collect this article. In 1775, the exports of Guadaloupe were 188,386 quintals of sugar, 62,029 of coffee, 1438 of indigo, 1024 of cocoa, and 5193 of cotton, besides hides and other articles, and 5193 of cotton. In 1741, the barter with Martinique and other islands. In 1759, Guadaloupe was taken by the English, and restored at the peace in 1763. It was again taken by the English in April 1794, but evacuated in the month of February 1795. It is about forty miles from the west of Toledo.

GUADALQUIVIR, a river of Spain, which rises in New Castile, and empties itself into the sea about six leagues north-west of Cadiz.

GUADALQUIVIVEJO, a river of Spain, which runs into the Guadalquivir near Ubeda.

GUADARMA, a town of Spain, in New Castile, celebrated for its cheese: six leagues north-west of Madrid.

GUADARRAMA, a town of Spain, in New Castile, which rises near the town of the same name, and runs into the Tagus about three leagues below Toledo. It is a port town of Asia, in the country of Meuran: 140 miles south of Kigdow.

GUADEN,
GUADEN, or Haden, a town of Africa, in the defect of Zanhaga. Lat. 21,40. N. Ion. 13, W. Green-wich.

GUADAMAR, a river of Spain, which runs into the Guadalquivir, a few leagues below Seville.

GUADIANA, a river of Spain, which runs into the sea about twenty miles north of Seville, and

GUADIX, a town of Spain, in the province of Granada, the see of a bishop, suffragan of Seville. This city was taken from the Moors by Alphonso in 1248, but was lost to the Moors not long after. In 1249, it was again taken from them by Ferdinand the Catholic. It contains three parishes and five convents. Its situation is between the Nevada before, and the mountains of Alpujars behind, so that they cannot cultivate olives and oranges, but other fruits are abundant, as well as corn and palfure: forty three miles south-east of Jaen, and twenty-eight east-north-east of Grenada. Lat. 37. 33. N. Ion. 13. 37. E. Peak of Teneriffe.

guadele, a district of Africa, in the country of Sejihelma, about one hundred miles south of the Atlas, which contains three towns and some villages. The principal produce is dates.

Guaduara, f. in botany. See Coccoloba.

Guadabio. See Psidium pomeferum.

Guadaca'na. See Diosporos.

Guajacum, f. [from the Spanish guayacan, formed from the Indian ho-ho-scan.] in botany, a genus of the clafs decandria, order monogynia, in the natural order of grumiferae (Urticaceae). The generic characters are—Calyx : perianthium five-leaved; leaflets ovate-oblong, concave, obtuse, spreading, deciduous; the two outer ones a little smaller. Corolla : petals five, roundish-ovate, orbute, concave, spreading, longer than the calyx, ending in short claws, inferted into the receptacle. Stamina : filaments subulate, broader at the base, upright, shorter than the corolla, inferted into the receptacle; antherae oblong, finally recurved. Pistillum : germ broader above, angular, pedicellated; style fubulate, broader at the base, incumbent, bifid at the base, yellow; filaments ten, contiguous and united; ovary short pedicellated, one-flowered; ovary sessile, trigonal; carpel one; ovule five; style permanent; stigmata five; septa none; fruit a capsule angular, five-celled. The roots run far into the ground perpendicularly, covering a great number of blue flowers, which are continuing its verdure in the drieft feaftons, and at times throwing out a great number of blue flowers, which are succeeded by compressed berries of a round fform.

This tree takes many years to arrive at its full growth. The roots run far into the ground perpendicularly, contrary to the usual growth of timber-trees in the Weft Indies, which generally shoot the largest prongs of their roots in a horizontal direction, and are commonly observed to run very near the surface. The bark is thick and smooth; the wood of a dark olive-colour, and closely-grained, the trata running obliquely into the another, in form of an X. As timber it answers where strength and duration are required, and is more than well in the turner's lathe: but is now chiefly used for shipblocks. The gum is obtained by jagging the body of the tree in May. It exudes copiously from the wounds, is formed gradually; and when accumulated, hardened by exposure to the air and sun, it is gathered, and packed in small kgs. This gum has been suspected sometimes to have been sophificated by the negroes with the gum of the manchinal tree, to which it bears some fimilitude at the first appearance; but it is easily diftinguifhed, by difolving a little in spirits: the true gum is purple, with a faint aroma, the manchinal gives a greenish cast: and this is still farther diftinguifhable by pouring a little of the same tinture into water, which takes from the guaiacum almost immediately the complexion of milk. The fruit is purgative, and, for medicinal ufe, far excels the bark. From the flowers also is prepared a laxative fyrup, resembling fyrup of violets. It is certainly one of the moft valuable trees in the Weft Indies; since the body, the bark, gum, fruit, leaves, and bloflom, are all applicable to fome useful purpofe. The fresh bark opens the body, and is deemed a fweetener of the blood, but the pulp of the berries purges and vomits very volitely. From the flowers alfo is prepared a laxative fyrup, resembling fyrup of violets.

Essential Character. Calyx, five-cleft, unequal; petals five, inferted into the receptacle; calyptral angular, five-cleft.

Species. 1. Guaiacum officinale, officinal guaiacum, or lignum-vitae : leaflets two pairs, obtufe. These are the common guaiacum, of which is made the famous incifer, or lignum-vitae: leaflets two pairs, obtufe. These are the common lignum-vitae or guaiacum, and becomes a very large tree, forty feet in height, and fifteen in diameter, covered with a hard, brittle, brownifih, bark, not very thick; the wood of a dark olive-colour, and becomes a very large tree, forty feet in height, and fifteen in diameter, covered with a hard, brittle, brownifih, bark, not very thick; the wood is firm, solid, and ponderous, appearing very reinous, of a blackifih yellow colour within, and of a hot aromatic taste: the smaller branches have an all-coloured bark. Leaves pinnate; leaflets two pairs, elliptic, fefille, entire, veined, thinning; peduncles terminating, round, shorter than the pedi¬cles; one-flowered; calyces leaflets ovate, convex, pubefcent; petals ovate, entire; filament ten, contiguous at the bafe; anthers incumbent, bifid at the base, yellow, about five or more, compressed; style permanent; capsule subterribulatate, rounded, ten-seeded; seeds of a very short pedicel, five-cornered, with very narrow winged ribs on the round back of the angles, succulent, smooth, pale ferrugineous (or yellow), five-cleft, (from two to five-cleft, Sec.) partitions quite ample, membranaceous, fixed to the middle of the cover; seeds large, thicker and blunt above, attenuated below, convex on one side, angular on the other, fufficient; or three cells are frequently abortive, but the vellicate of them remain. The rind of the capsule is continuous and the partitions indivifible; it is roughly contrary to the usual growth of timber-trees in the Weft Indies, which generally shoot the largest prongs of their roots in a horizontal direction, and are commonly observed to run very near the surface. The bark is thick and smooth; the wood of a dark olive-colour, and closely-grained, the trata running obliquely into the another, in form of an X. As timber it answers where strength and duration are required, and is more than well in the turner's lathe: but is now chiefly used for shipblocks. counts for its efficacy in chronic rheumatism; and from its passing off by the pores of the skin, he considers it as a probable remedy in some cutaneous disorders. In the London Dispensatory there is a tincture of gum guaiacum, Purissima aromatica gum guaiacum; and the wood is an ingredient in decoc tum farfoparilum com pos. The Edinburgh college have directed an elixir to be prepared, an ingredient in it.

Jacquin, from Richard Vander Schot, his companion in his travels, admitting a large share of free air to them every day. They cannot be expected to make great progress in Europe.

The principal articles of commerce are cattle, hides, and sweetmeats.

GUAMANGA, a jurisdiction of Peru, in archbishopric of Lima, situated in the centre of the Cordilleras, consequently its air very different. This jurisdiction begins eighty leagues north-east of Lima, and, its situation being rather cold than temperate, few places are fertile in its whole extent, which is above forty leagues. The natives go naked, and never bury their dead, but leave them exposed to the air. Lat. 13° 25' N. Lon. 162° E. Ferro. See MARIANA ISLANDS.

GUAMALIES, a district of Peru, in the archbishopric of Lima, situated in the centre of the Cordilleras, consequently its air very different. This jurisdiction begins eighty leagues north-east of Lima, and, its situation being rather cold than temperate, few places are fertile in its whole extent, which is above forty leagues. The Indian inhabitants of the towns apply themselves to weaving, and make a great variety of baizes, ferges, and other stuffs, with which they carry on a very considerable trade with the other provinces destined for such manufactures.

GUAMANGA, a town of South America, in Peru, the
GUAIACUM.

Guaiacum officinale, or Lignum Vitæ.

London, Published as the Act directs March 8 1798, by J. Walker.
the see of a bishop, whose diocese extends over several districts. The town was founded in 1539, by Francis Pizarro, on the site of an Indian village. The Spaniards added the name of San Juan della Victoria, in memory of the precipitate retreat of Manco, the Inca, from Pizarro, who offered him battle. The city was founded for the convenience of the trade carried on between Lima and Cuzco; for during this long distance there was at that time no town, whence the travellers frequently suffered by the incursions of Manco's army. This gave occasion to building the city on the spot where the Indian village stood, though extremely inconvenient with regard to provisions, as lying contiguous to the great chain of the Andes; but the war being happily terminated by the entire defeat of Manco's party, the city was removed to its present situation. There are three parochial churches, one for Spaniards, and two for Indians, besides the cathedral, and several other churches and convents. Among the inhabitants are twenty noble families, who live in a quarter of the town separated from the rest. In it is an university, which enjoys a great revenue, for the study of philosophy, divinity, and law. Lat. 12. 50. N. Lon. 60. 10. W. Ferro.

GUAMANTAGUA, a town of Peru, in the audiencia of Lima, and jurisdiction of Canta, in which is a celebrated image of Christ, to which the inhabitants of Lima go in pilgrimage at Whitsuntide.

GUAMANU, a town of the island of Cuba; eight miles south-south-west of Lisbon.

GUAMA'RA, a river of South America, in the country of Brazil, which runs into the Atlantic forty-two miles north of Fernambuco.

GUAME'CO, a town of South America, in the province of Carthagena.

GUAMOS, a river of Spain, which runs into the Guadalquivir, about five miles below Cordova.

GUAMU'BO, a town of the island of Cuba; twenty miles east of Havanna.

GUAMULOS, a town of the island of Cuba; eighty-three miles south-south-east of Santa Clara.

GU'ANA ISLAND, a small island in the West Indies, near the north-east coast of the island of Tortola.

GUANA ISLAND, an island in the West Indies, about two miles long, and half a mile wide, near the north-east coast of the island of Antigua. Lat. 17. 16. N. Lon. 61. 26. W. Greenwich.

GUAPA'TA, a volcano near Arequipa, in the valley of Quiaca, in South America, and empire of Peru; whose eruptions, assisted by an earthquake, laid Arequipa in ruins the first year.

GUAPA'NTA, a volcano in South America, the seat of a town of the same name, about three miles north of Guamanga.

GUAPA'POINT, a cape on the west coast of the island of St. Christopher. Lat. 17. 21. N. Lon. 62. 23. W. Greenwich.

GUANABA'NUS, f. in botany. See Annona and Annona.

GUANACACHE, a lake of South America, in the province of Chihouette, fifteen leagues in length.

GUANCA'VELICA, a town of South America, in the province of Chiquitano, fifteen leagues in length.

GUANCA'VELICA, or HUANCA VELECA, a jurisdiction of South America, in the bishopric of Guamanico, in the province of Peru. The town which gives name to this government was founded on account of the famous rich quicksilver mine; and to the working of it the inhabitants owe their whole subsistence; the coldness of the air checking the growth of all kinds of grain and fruits, so that they are obliged to purchase them from their neighbours. This town is noted for its water, where such large petrifications are formed, that the inhabitants use them in building houses, and other works. The quicksilver mines wrought here supply with that necessary mineral all the silver mines of Peru; and, notwithstanding the prodigious quantities already extracted, no diminution is perceived. This mine, in 1779, was a hundred and seventy fathoms in circumference, and four hundred and eighty-five deep, and the mercury is found from hence into all the provinces in which they work mines; the quantity, in 1763, was 5544 quintals, by which 574,100 pounds weight of silver were produced.

GUANCHES, the aboriginal inhabitants of the Canary Islands. Before the arrival of the Spaniards, this simple and virtuous people lived under the salutary restraints of a few equitable and respected laws. To these inhabitants were attributed the furious ravages of the ten thousand indians, which had long composed a separate state, acknowledged the authority of nine of their kings, or petty princes; who were clothed like their subjects, being distinguished from them only by a laurel crown, and the thigh-bone of one of their most renowned ancestors, which they bore at once as a sceptre and as a remembrance of virtues that had secured the love and the regret of the people. Though they had a brief, who profcribed at certain ritual ceremonies, they appear to have had very imperfect notions of religion. Their mythical usages, of which baptism was one, were professed to have been derived from some more enlightened people, whose memory had perished. The rate in which several of their mummies have been found in their respective grottos, or catacombs, attest their rude attempts to embalm their dead. They expressed numerical signs by small pieces of baked clay; and they were ignorant of the use of metals. Though legitimate and peaceful poiffelors of the island, and though they bravely resisted the encroachment of the invaders, they were cruelly put to death in detail, and at length exterminated. Their pretended descendants, who live about Guimar, and who make a procession on Candlemas-day, in the old national costume, are supposed to be a fpirous race, or a tribe of impoftors.

GUANDA'GANO, a town of Italy, in the Friuli, belonging to the state of Venice; twenty-nine miles north-west of Friuli, and twenty-nine miles south-east of Belluno.

GUANGARA. See Wanga'ra.

GUANIMA, one of the Bahama islands.

GUANOBUCOA, a town of the island of Cuba; eight miles north of Guamanga.

GUANTA, a jurisdiction of South America, in the bishopric of Guamanico, with a town of the same name; thirty miles north of Guamanga.

GUANUCO, or GUARI, a town of South America, in Peru, and capital of a jurisdiction, which begins forty leagues north-east of Lima. This city was formerly one of the principal in these kingdoms, and the settlement of one of the first of the invaders; they were cruelly put to death in detail, and at length exterminated. Their pretended descendants, who live about Guimar, and who make a procession on Candlemas-day, in the old national costume, are supposed to be a spurious race, or a tribe of impostors.

GUARANTE, f. [guarant, Fr.] A power who undertakes to see stipulations performed. God, the great guaranty for the peace of mankind, where laws cannot secure it, may think it the concern of his providence.

To GUARANTY, v. a. [guarantir, Fr.] To undertake to secure the performance of any articles. France hath always profited skillfully of its having guarantied the treaty of Munster, Chatelet.

GUARANTY, f. [from the verb.] Engagement to secure the performance of articles. It was made in consideration to the engagements that the crown of England had taken, when King William gave his guaranty to the treaty of Travendhal, Bolingbroke.

GUARCHIPY, a jurisdiction of South America, in Peru. This province begins in the mountains, about fix
fix leagues east of Lima. From the disposition of its parts, those places only which lie in the valley, and in the breaches of the mountains, are inhabited; and these are very fertile, producing great quantities of fruit, wheat, barley, maize, and other grain. In its mountains are several silver mines, though but few of them.

GUARD, v. a. [garde,-, Fr. ward, warden.] To watch by way of defence and security; as, to guard the coast. —To provide against objections. —Homer has guarded every circumstance with as much caution as if he had been aware of the objection. —To adorn with lilies, laces, or ornamental borders. —Obsolete.

Who by health
Had from his wakeful custody purloin'd
The guarded gold.

To protect; to defend:
Naked the graces guarded you from all
Dangers abroad, and now your thunder shall, Waller.

Your pow'r you never lose, but for defence,
To guard your own or others innocence.

To prevent by caution. —One would take care to guard one's self against this particular imperfection, because it is that which our nature very strongly inclines us to.

Guarded every circumstance with as much caution as if he had been aware of the objection.

Give him a livery
More guarded than his fellows.

To GUARD, v. a. To be in a state of caution or defence. —To guard against such mistakes, it is necessary to acquaint ourselves with a little word. Watts.

GUARD, f. [garden, Fr. ward, Teut.] A man, or body of men, whose business is to watch by way of defence or prevention. —The guard bare them, and brought them back into the guard-chamber. —To adorn with lilies, laces, or ornamental borders. —Obsolete.

Up into heav'n, from paradise, in haste
Th' angelic guards ascended.

A state of caution; a state of vigilance. —It is wisdom to keep ourselves upon a guard. —Elfrange.

Now he flood collected and prepar'd;
For malice and revenge had put him on his guard. —Dryden.

Limitation; anticipation of objection; caution of expression. —They have expressed themselves with as few guards and reftrictions as I. Atterbury. —An ornamental hem, lace, or border. —Obsolete.

The guards are but lightly bailed on. —Shakspeare. —Part of the blade or point of a sword. Any thing that guards something else; as, a guard that keeps the dregs from dirt. —Mason's Supplement.

GUARD, n. A name sometimes applied to the two stars nearest the north pole; being in the hind part of the chariot at the tail of Ursa Minor or little bear; one of them being also called the pole star.

GUARD-BOAT, f. The boat which is appointed to row the rounds to observe ships laid up in the harbour.

GUARD-IRON, f. The arched bars of iron placed over the ornamental figures on the head or bow of a ship.

GUARD-ROOM, f. The room where the yeomen of the guard wait on court-days at St. James's.

GUARD-SHIP, f. A ship of war to guard the coast.

GUARD, v. a. In law, one who hath the custody and education of such persons as are not of sufficient discretion to guide themselves and their own affairs, as children and idiots.

Guardians, by the common law, were guardians in chivalry; guardians by nature, such as the father or mother; guardians in loco, who are the next of blood to whom the inheritance cannot descend, if the father does not order it otherwise; and guardian because of nurture, when the father by will appoints one to be guardian of his child. —Co. Lit. 18. 221. 328.

The several guardians therefore now in use, may be thus enumerated: 1. By nature. 2. For nurture. 3. In office.
Many books, both of ancient and modern date, are presumptive of guardianship by nature; which restriction is so true, that it hath even been doubted whether such ancestors, if the same infant happens to be heir-apparent, are entitled to the custody of the infant's person even in socage. 1 Inst. 88. But an executor may not pay to a father a legacy left to an infant. 1 P. Wm. 283. And with regard to guards, it seems by construction of that 4 & 5 P. & M. c. 5, that the father might by deed or will affinge a guardian to any woman child under the age of sixteen; and if none be so Alligned, the mother shall in this case be guardian. 3 Rep. 39. The said 4. & 5 P. & M. provides, under severer penalties, "That nobody shall take away any maid or woman child unmarried, being within the age of sixteen years, out of or from the poifeffion, custody, or government, and against the will, of the father of such maid or woman child, of such perfon or persons to whom the father of such maid or woman child by his last will and testament, or by any other act in his life-time, hath or shall appoint, align, bequest, give, or grant, the order, keeping, education, and government, of such maid or woman child."

Many books, both of ancient and modern date, are very indifferent when they mention guardianship by nature. But it appears to be now settled, that not only the father, but also the mother, and every other ancestor, may be guardians by nature, though with considerable differences, such as denote the superiority of the father's claim. The father hath the first title to guardianship of his own child: as to other ancestors, if the same infant happens to be heir-apparent to two, perhaps priority of the poifeffion of the person of the infant might probably be allowed to decide the question. While the tenure by knight's service continued, there was another difference, which more strongly marked the superiority of the father's claim; for he was intitled to the custody of the infant's perfon even against the lord in chivalry; a preference not allowed to the mother or other relations; and this diversity appears to reconcile the determinations in the old books, which apply only to cases in which the right to the infant's perfon was in contest with the lord in chivalry. 3 Co. 38 b. Ratcliffe's Ca. According to the strict language of the common law, an heir apparent can be the only proper object of guardianship by nature; which restriction is so true, that it hath even been doubted whether such guardianship can be of a daughter, whose heirship, though denominated apparent, yet being liable to be superseded by the birth of a son, is in effect rather of the preemption kind. 1 Inst. 84 c. Therefore, when the term of guardianship by nature is extended to children in general, or to any besides such as are heirs apparent, it is not conformable to its legal sense, but must be understood to have reference to some rule independent of the common law; as the dictates of nature, and the principles of general reason. Yet we must not conclude that parents have a right to the custody of their children, for the law gives them this custody till the age of fourteen by the guardianship for nurture; which though it differs from that by nature, not only in name, but also in duration, and some other particulars, is founded on a like conformity to the order of nature. 1 Inst. 83 b. This guardianship by nature continues till the infant attains the age of twenty-one; it extends no farther than the custody of the infant's perfon. It yields, as to the custody of the perfon, to guardianship in fowage, where the title to both guardianships concur in the same individuals. 1 Inst. 83 b. But guardianship in fowage ending at fourteen, it seems that after that age the father, or other ancestor having a like title to both guardianships, becomes guardian by nature till the infant's age of twenty-one. Earth. 384. Lastly, the father may dispoft the mother and other ancestors of the guardianship by nature, by appointing a testamentary guardian, under the flats. 4 & 5 P. & M. and Ist Car. 11. Guardians for Nurture, and of commendation, of father or mother till the infant attains the age of fourteen years. Moir, 738. 3 Rep. 38. In default of father or mother, the ordinary usuallly affigns some discreet person to take care of the infant's personal estate, and to provide for his maintenance and education. 2 Car. 153.

This guardianship by nurture, only occurs where the infant is without any other guardian; and it has been said that none can have it except the father or mother. 8 E. 4. 7b. 3 Co. 38. It extends no further than the custody and government of the infant's perfon; and determines at fourteen in the case both of males and females. Conyns refers to Fleta, as if, according to that ancient book, grandparents and great-grandfathers might be guardians by nurture. But the statute cited by him doth not point at this species of guardian, describing the patria potestas in general, and being apparently borrow'd from the text of the Roman law; nor will it bear the least application to guardianship as our own law regulates it.

Guardians in Socage, are also guardians by the common law. Wardship is incident to tenure in socage, but of a nature very different from that which was formerly incident to knight-service. For if the inheritance descends to an infant under fourteen, the wardship of him does not, nor ever did, belong to the lord of the fee: because in this tenure no military or other personal service being required, there could be no precedent for the lord to take the custody and government of the infant's perfon; and it has been said that none can have it except the father or mother. 8 E. 4. 7 b. 3 Co. 38. This guardian is not further than the custody and government of the infant's perfon; and determines at fourteen in the case both of males and females. Conyns refers to Fleta, as if, according to that ancient book, grandparents and great-grandfathers might be guardians by nurture. But the statute cited by him doth not point at this species of guardian, describing the patria potestas in general, and being apparently borrow'd from the text of the Roman law; nor will it bear the least application to guardianship as our own law regulates it.

Guardians in Socage, are also guardians by the common law. Wardship is incident to tenure in socage, but of a nature very different from that which was formerly incident to knight-service. For if the inheritance descends to an infant under fourteen, the wardship of him does not, nor ever did, belong to the lord of the fee: because in this tenure no military or other personal service being required, there could be no precedent for the lord to take the custody and government of the infant's perfon; and it has been said that none can have it except the father or mother. 8 E. 4. 7 b. 3 Co. 38. This guardian is not further than the custody and government of the infant's perfon; and determines at fourteen in the case both of males and females. entitled to be guardian in fogo is himself under custody of a guardian, the latter is entitled to the custody of both, to the infant in his own right, and to the latter pur caufe de ward, that is, in right of his wardship of the former; a species of guardianship distinct from all others above enumerated. And it seems that only guardian in chivalry and in fogo could be guardian pur caufe de ward, that is, in right of his wardship of the infant, but also to his hereditaments not lying in tenure; and even to his copystholds, unless there is a special custom for the lord's appointing a guardian of them. 1 Lof. 89 b. 2 Lutw. 1181. But whether the guardian in fogo is entitled to take into his custody the infant's personal estate, is not acertained by any express authority. It seems however that personal estate is inheritable, except where by the custom of a particular place it happens to be liable to a different custody: for including this species of property for which the law hath not otherwise provided; which receives some countenace from the instances of copystholds, and hereditaments not lying in tenure, for including which it will be difficult to account by any other reason than that above given for including personal estate.

Guardianship in fogo is superceded both as to the body and lands, if the father exercises his power of appointing a testamental or other guardian according to flat. 12 Car. II. c. 24. And regularly it ends, when the infant's heir attains fourteen, whether male or female, attains fourteen, though some lay that this must be understood only where another guardian, either by election of the infant or otherwise, is ready to succeed; and that the guardianship in fogo continues in the mean time. Abd. 313. At that age, however, it seems the heir may out the guardian in fogo, and call him to account for the rents and profits. Ca. Lut. 89 b. It was in this particular only that wardship was, as also in that of marriage, and in the certainty of the rendering or service, that the fogo tenures had so much the advantage of the military ones. But as the wardship ceased at fourteen, this disadvantage attended it; that young heirs, being left to fo tender an age to choose their own guardians till twenty-one, might make an improvident choice. Therefore when almost all the lands in the kingdom were turned into fogo tenures, by the flat. 12 Car. II. c. 24, that statute gave the power of appointing the testamental guardian next mentioned. If no such appointment be made, the court of chancery will frequently interpone, and name a guardian, to prevent an infant heir from improvidently exercising a power to ruin himself, and his children, by the flat. 12 Car. II. c. 24. The flat 12 Car. II. c. 24, considering the imbecility of judgment in children of the age of fourteen, and the abolition of guardianship in chivalry, enacts, that any father, under age of or full age, may by deed or will, attested by two witnesses, dispose of the custody of his child, either born or unborn, to any person, except a papal recurrent, either in poitition or remainder; that he may appoint any guardian to last till such child attains the age of twenty-one. These are called guardians by flatut, or testamental guardians.

The substante of this parliamentary regulation is, that the father shall have the power, though under twenty-one; that he shall have it as to all his children under twenty-one, and unmarried at his decease, or born averse; that he may appoint any person except a pope or recurrent; that the appointment may be either in possession or remainder; that he may appoint the guardianship to last till twenty-one, or any less time; that the appointment shall be effectual against all claiming as guardians in fogo or otherwise; that the guardian so appointed shall have judgment of ward or replevins, and, if a guardian for the ward's benefit; that the guardian shall have the custody of the infant's estate both real and personal, and have the same actions in relation to them as a guardian in fogo.

The right of electing a guardian by an infant, arises only when from a defect in the law, (or rather in the execution of it,) the infant finds himself wholly unprovided with a guardian. This may happen either before fourteen, when the infant has no such property as attracts a guardianship by tenure, and the father is dead without having executed his power of appointment, and there is no mother; or after fourteen, when the custody of the guardian in fogo terminates, and there is no appointment by the father under the flat. 12 Car. II. Lord Coke only takes notice of such election where the infant is under fourteen; and as to this omits to state how, and before whom, it should be made; see 1 Lof. 87 b; nor does this defect seem supplied by any prior or contemporaneous writer. As to a guardian after fourteen, it appears from the ending of guardianship in fogo, at that age, as if the common law deemed a guardian afterwards unnecessary. However, since the flat. 12 Car. II. c. 24, it has been usual, in defect of an appointment under the statute, to allow the infant to elect one for himself. The late lord Baltimore, when he was turned of eighteen, might have elected a guardian, thereby making no tender of the necessity of having one for some special purposes relative to his proprietary government of Maryland, named a guardian by deed; a mode adopted by the advice of counsel. It seems in fact as if there was no prescribed form of an infant's electing a guardian after fourteen, any more than there is before, and therefore election by personal authority, though not prescribed, might be legally sufficient. The deficiency in precedents on this occasion is easily accounted for; this kind of guardianship being of very late origin, unnoticed as it seems by any writer before Coke except Swinburn; (Topham ed. 1593. 97 b;) and there being yet no cases in print to explain the powers incident to it, or whether the infant may change a guardian so constituted by himself. Coke, though he hesitated to enumerate the different sorts of guardianship, omitted this in one place: whence perhaps it may be conjectured that in his time it was in strictness scarcely recognised as legal. 1 Lof. 88 b.

As to guardian by appointment of the lord-chancellor, it is not easy to state how this jurisdiction was acquired; it is certainly of no very ancient date, though now inadmissible. The first instance of such a guardian, appointed on petition without bill, was in the year 1666, in the case of Hampden. But since that time the court of chancery has exercised this power, without its being once called in question; therefore, in the case of lady Teynham v. Leonard, in Dom. Proc. Ass. 1724, the counsel for the plaintiff stated, that, as a matter of course, the lord-chancellor was entrufted with that part of the crown's prerogative, which concerned the guardianship of infants. Under the same idea too, the marriage-act, flat. 26 Geo. III. c. 33, refers to the chancellor for the appointment of a guardian, to content to marriage, where the infant is without a guardian, and the mother is not living. The court never appoints a guardian to a woman after marriage. 1 Vez. 157. All courts of justice have a power to adjourn a guardian to an infant to sue, or defend actions, if the infant comes into court and deceives it; or a judge at his chambers, at the desire of the infant, may adjourn a per son named by him to be his guardian; but this lift is no record until entered and filed by the clerk of the rules. 1 Lof. 88 b. 2 Lof. 279. This is called a guardian ad litem.

Guardian by appointment of the ecclesiastical court seems now perfectly insignificant, and merely on a par with other guardians ad litem. The right of appointment is however claimed by that court, as to personal estate, and, if there be any, recovered for the ward, or other, for the per son afo. But lord Hardwicke reprobated it as a presumption in the ecclesiastical court.
to appoint a guardian of the person and estate, and declared their appointment, except when a suit was depending, to be an interference with his power as chancellor; and even recommended to the attorney-general pending, to be an interference with his power as chancellor to appoint a guardian of the person and estate, and defend the right of guardianship in the full extent of lord chancellor's, the power of appointment in the ecclesiastical courts was considered as confined to guardians ad litem, and therefore perfectly insignificant. 3 barr. 1436. 1 iff. 88 b.

Guardianship is cognizable by the temporal courts, where a devil is made of it; which courts are to judge whether the devil be pursuant to the statute. 1 vent. 207. The husband of a woman under age cannot disaffirm a guardian made by the court for his wife. 1 vent. 185. An infant cannot revoke the authority of his guardian: but the court may discharge one guardian, and appoint another, at their discretion; and the justices of ad litem may appoint a new guardian. palm. 152. 1 barr. abr. 604.

If a woman has issue a son by a former husband, and marries a second husband, seised of fagoage lands, by whom she has issue another son, and the husband and wife dies, leaving the second son under fourteen, his brother of the half-blood shall be guardian in fagoage; as next of kin, but after the issue of the first husband, the inheritance cannot descend. cro. eliz. 825. morr. 632.

It is clearly agreed, that the king, as pater patriae, is universal guardian of all infants, idiots, and lunatics, who cannot take care of themselves; as this care cannot be exercised otherwise than by appointing them proper curators or committees; it seems also agreed, that the king may, as he has done, delegate the authority to his chancellor; therefore at this day, the court of chancery is the only proper court which hath jurisdiction in appointing and removing guardians, and in preventing them and others from abusing their persons or estates. 1 iff. 14. 4 co. 152. And as the court of chancery is now invested with this authority, hence in every day's practice we find that court determining, as to the right of guardianship, who is the next of kin, and who the most proper guardian; as also orders are made by that court on petition, or motion, for the provision of infants during any dispute therein; as likewise guardians removed, or compelled to give security; they and others of the same class cannot be removed, without an effectual care taken to prevent any abuses intended in their persons or estates; all such wrongs and injuries being reckoned a contempt of that court, it having, by an established jurisdiction, the protection of all persons under natural disabilities. 2 mod. 177.

As the law hath invested guardians not with a bare authority only, but also with an interest till the guardianship ceases; so it hath provided several remedies for guardians against those who violate that interest: at common-law there were remedies both dritortual and pooffecutory, to recover the guardianship. 1 iff. 92. 9 co. 72. A guardianship of a minor is an interest in the body and lands of one within age. Guardians to infants, appointed by a testate guardian, against another who is appointed by the testator, for a debt recovered at law for the infant. A guardian in fagoage may keep courts, in the infant's manors, in his own name, grant copies, &c. He is dominus pro tempore, and hath an interest in the lands. cro. fac. 91. Such guardian may let the land for years, and avow in his own name and right; and his lease for years may maintain ejectment; but he cannot present to an advowson, for which he may not lawfully account; and the infant must present, of whatsoever age. Though it is said, if the infant be within the age of disfension, his guardian may present. 8 edw. 110. 1 iff. 89 a. In another place lord Coke extends the doctrine so far as if the infant should present, whatsoever his age may be. 7 iff. 156. But some suppose the guardian to have the right of presenting in the name of the infant, in general; others admit the right of the infant; but add, that if he be of such tender years as not to have any disfension, then the guardian should present for him. vin. abr. tit. guardian Q. pt. 2. But the law now is, and was still, that the child was adfuvion was conveyed to trustees on trust to present such person as the grantor, his heirs and assigns, should by deed appoint; and, on the principle that in infant of any age may present, the chancellor confirmed an appointment by an infant heir, though it appeared that the child was not a year old, and that the guardian guided the child's hand in making his mark and putting his seal. 2 eq. abr. infant B. pl. 3. vin. abr. 3 atk. 710. It still remains however undecided, whether the want of disfension might not induce a court of equity to controvert the exercise of this right by an infant, in case a presentation should be obtained without the concurrence of his guardian. 1 iff. 89 a.

A guardian for nurture of the minor, appointed by will, hath power to make leases at will only. cro. eliz. 679. A testamentary guardian cannot make a lease of the infant's lands; but such lease is absolutely void. 2 will. 129. Guardians are to take the profits of the infant's lands, &c. to the use of the infant's estate for the same; they ought to sell all moveables in a reasonable time, and turn them into land or money, except the minor is near of age, and may want such goods himself; and they shall pay interest for money in their hands, which might have put out at interest; in which case they shall be presumed the guardians made use of it themselves. 3 thit. 177.

The power and reciprocal duty of a guardian and ward, are the fame pro tempore as that of a parent and child; but the guardian, when the ward comes of age, is bound to give him an account of all that he has transacted on his behalf, and must answer for all losses by his own willful default or negligence. In order therefore to prevent any agreeable contests with young gentlemen, it has become a practice for many guardians, of large estates especially, to indemnify themselves by applying to the court of chancery, acting under its direction, and accounting annually before the officers of that court. That court, in case any guardian abuses his trust, will check and punish him, and appoint another in his stead. 1 seid. 424. 2 bern. tit. 793. 1 comm. gen. 463. 17. Whether the guardian has a right to make a lease of the infant's lands, or profits of the infant's lands, or to sell all moveables in a reasonable time, and turn them into land or money, except the minor is near of age, and may want such goods himself; and they shall pay interest for money in their hands, which might have put out at interest; in which case it shall be presumed the guardians made use of it themselves. 3 thit. 177.

By the common-law, guardians in fagoage are accountable to the infant, either when he comes to the age of fourteen years, or at any time after, as he thinks fit. co. lit. 87. And so is one who is guardian by nature after the infant's age of twenty-one. But the guardian on his account, shall have allowance of all reasonable expenses; and if he be robbed of the rents and profits of the land, without his default or negligence, he shall be discharged thereof upon his account; for he is in the nature of a bailiff or servant to the infant, and undertakes no otherwise than for his diligence and fidelity. co. lit. 89 a. But against a testamentary or other guardian, whose authority doth not determine till the infant is of age, 20 years, or being a female, attaining the marriage; the infant cannot have action of account before: for the rule of the common-law is, that account shall not lie while the guardianship continues. But in equity the infant may by prochein amicus sue his guardian for an account during the minority. 2 vern. 342. 2 P. wills. 119. A guardian cannot be charged in account as a receiver: because then he would lose his costs and expenses; there is said to be in general allowed only to guardians and bailiffs, and not to receivers. See 1 iff. 89 a.

A guardian shall answer for what is lost by his fraud, negligence, or omission; but not for any casual events, as where the thing had been well, but for such an accident. litt. 123. By statute Marg. Const. 9 Hen. III. c. 5. guardians were to retain the lands till the heir came to the age,
age, and then restore the same as fully stocked, &c. as received. By lat. 6 Anne, c. 18, persons who are guar¬
dian of the spiritual jurisdiction of any diocese is committed, during the vacancy of the fee. See lat. 25
Hei. VIII. c. 21: and 3 Edu. I. c. 21. The archbishop is
-then reftored as fully (locked, &c. received. By that.
Anne, c. 16, person who are guardians, and be accountable for profits, &c. By that.
Guar-trefpalfers, and be accountable for profits, &c. By that.

GUAR DO, a town of Italy, in the Brefian, belonging to
the state of Venice: ten miles north-east of Brefcia.

GUAR DO, a town of Spain, in the province of Leon:
fourty miles efort-north-east of Leon.

GUAR’DSHIP, f. Care; protection:
How blest am I, by such a man led!
Under whose wife and careful guardianship
I now despife fatigue and hardhip.

Swift.

GUARE’A, f. [from its vernacular name of Guar,
in the West Indies.] In botany, a genus of the class
octandria, order monogynia, in the natural order of
melia, fajf. The generic characters are—Calyx per-
nthum one-leafd, four-parted, falt, short. Corolla:
peduncle spreading, lanceolate, obfrute; nectary tu-
bular, cylindrie, quite entire, length of the corolla, con-
tracted at the throat. Stamens: filaments none; anthers
eight, growing to the inner edge of the nectary, ovate.

Poole.
Italian poetry; and its merit may be estimated by the
general interest it excited among men of letters, and
the high reputation it conferred upon its author, who was
created a member of the principal academies in Italy.

GUARINO, surnamed VERONESE, an eminent co-
adjuior in the revival of literature, born at Verona in
1370. He was a dísciple, for the Latin language, of
John of Ravena; but not satisfied with this degree of
knowledge, he failed to Constantinople about his twen-
ty-eighth year, in order to learn Greek of Manuel Chryso-
loras. On his return to Italy he began to keep an open
school, and several cities had the benefit of his instruc-
tions. Of these were Florence, Bologna, Padua, Trent,
Verona, Venice, and Ferrara; but neither the order nor
the duration of his residence in them is precisely known.
It is certain that he was at Venice in 1415, and at Ve-
rona in 1422. He had many distinguished scholars, and
to him is in great part owing the reformation of ancient
elegance in the Greek and Latin languages which took
place in the fifteenth century. His last and longest refi-
dence was in Ferrara, whither he was invited as precep-
tor to Leonello d'Este, fon of the marquis, Nicholas III.
His Latin poems, in four books, were printed at
Ferrara in 1496. He besides composed Latin letters
published by the Mantuan, situated near the Po, at the union of the
rivers Crocola and Tagliata, with a small territory, to
which is annexed the title of duchy, which duchy was
ceded by the treaty of Aix-la-Chapelle, in 1748, to the
duke of Parma. In 1597 it became part of the Cis-
Albertine republic; it now belongs to the kingdom of Italy.

GUASTAVALD, f. one who has the cufdoy of the
king's manuf-tories.

GUASTALIANI, a religious order instituted by
the countess of Guastellla, in 1379.

GUASTAL/LA, or GUASTELLA, a town of Italy, in
the Mantuan, situated near the Po, at the union of the
rivers Crocola and Tagliata, with a small territory, to
which is annexed the titles of duchy, which duchy was
ceded by the treaty of Aix-la-Chapelle, in 1748, to the
duke of Parma. In 1597 it became part of the Cis-
Albertine republic; it now belongs to the kingdom of Italy.

GUASTALEGRE, a town of Italy, in
the kingdom of Naples, and province of Abruzzo Citta, near the coast
of the Atlantic: fifteen miles south-east of Ranciano.

GUATAC/MALA, a small river of Spain, in Ara-
gon, which runs into the Yiuela.

GUATAMAL/A, an ancient city and province in New
Spain, about 750 miles in length, and 450 in breadth.

GUASTO, a town of Italy, in the kingdom of Na-

Ples, and province of Abruzzo Citta, near the coast
of the Atlantic: fifteen miles south-east of Ranciano.

GUATIMAC/A, a province of North America, in the
geographical limits of Mexico, and capital of the
province of Guatemala, is situated in a valley,
through the middle of which runs a river between two burn-
ing mountains. In 1544 this city was ruined by a dread-
ful tempest, and a number of the inhabitants were buried
in the ruins. It was rebuilt at a good distance from the
volcano, and became a large and rich town, with a
bishop's see, and an university; but it was swallowed up
by an earthquake in 1773. It contained about sixty
thousand inhabitants of all colours, and was immen-
sely rich, but there are no traces of it left. The loss was
valued at fifteen millions sterling; and it was the third
city in rank in Spanish America. In this dreadful
earthquake eight thousand families instantly perished.
New Guatemala is built at some distance, is well inha-
tilated, and carries on a great trade. Lat. 14. 18. N.
Long. 74. 54. W. Ferro.

GUATIMAR, a town of the island of Cuba: fifty
miles north-north-east of St. Jago.

GUAVA, f. in botany. See Psidium.

GUAVAJ/RI, a river of South America, which runs
into the Oronoko. Lat. 3. N. Long. 51. W. Ferro.

GUAXACA, a town of Mexico, and capital of the
province of the above.
GUAYACAN, f. in botany. See Guayacum.

GUAYAQUIL, called Guagual, and Guayaquil, a city, bay, harbour, and river, in Peru, South America. Guayaquil city is a former city of Spanish origin, being as ancient as 1534; and is situated on the west side of the river Guayaquil, north of the island of Puna, at the head of the bay, and about 155 miles south-south-west of Quito, in 71° 11' south lat. 17° 17' west lon. Guadalupe, or Old Town, was its first settlement, but it was removed about a quarter of a league in 1608 by Orellana; and the communication over the great ravines or hollows of water, preferred between the old and new towns by a wooden bridge of half a quarter of a league. The city is about two miles in extent; it is defended by three forts, two on the river near the city, and the third behind it, guarding the entrance of a ravine. The churches, convents, and houses, are of wood. It contains about 20,000 inhabitants, Europeans, Creoles, and other calls; besides a number of strangers drawn hither by commercial interests. The women are famed for their personal charms, polite manners, and elegant dress. The salt creek here abounds with lobsters and oysters; yet the fish in the neighbourhood are not of much value, being full of bones, and unpalatable. But this place is most noted for a shell-fish called turbinia, no bigger than a nut, which produces a purple reckoned to exceed all others in the world, and to vie with that of the Tyrians. It is called the purple of Puna, a place in the jurisdiction of Guayaquil. With this valuable and scarce purple, they dye the threads of cotton, ribbons, lace, &c. and the weight and colour are said to exceed according to the hours of the day; so that one of the first preliminaries to a contract is to settle the time when it shall be weighed. The dye is only the blood of the fish, pressed out by a particular process; and the cotton so dyed is called by way of eminence exsudatio. The river Guayaquil is the channel of its commerce; and the distance of the navigable part of it to the Custom-house of Babahio is reckoned about twenty-four leagues. The commerce of this place is considerable; the productions of the country alone form the most considerable part of it; these are cocco, timber, salt, horned cattle, mules, and colts; Guinea pepper, drugs, and lana de ceibo, a kind of silky wool, the produce of the Ceiba, and the weight and colour are said to exceed that of cotton. It is used for mattresses and beds.

Guayales, a jurisdiction of South America, in the archbishopric of Lima; cattle form the principal riches of the district; it is situated to the west of Guanahales.

Guaynamota, a town of Mexico, in the province of Guadalaxara; seventy miles north-west of Guadalaxara.

Guay-Trouin (René du), one of the bravest and most successful of the French naval officers, born in 1673, at St. Malo. Having become master of a privateer, in 1695, he took three rich prizes on the Irish coast, and then, proceeding to the coast of Spain, made himself master of two Dutch vessels. In 1696 he fell in with the baron de Waffenaer, who with three ships was escorting a fleet of merchantmen, and took the baron, with part of his convoy. He presented his prisoner to the French king, and thereupon was removed to the royal navy, and appointed to the command of a frigate. Soon after, he was made second captain of the Dauphin, commanded by the count de Maintz. In that year he took a Dutch man-of-war of thirty-eight guns; and in 1704 he captured an English man-of-war of seventy-two guns, with his own ship of fifty-four guns. Proceeding in a career of successes, he was rewarded in 1709 with letters of noblesse, the preamble of which records his having captured more than three hundred merchant ships and twenty ships of war. The most remarkable of his exploits was the taking of the Portuguese settlement of Rio Janeiro in 1711, on which occasion the loss to that nation was upwards of twenty-five millions of livres. He obtained a pension for this service. In 1718 he was made commander of the order of St. Louis and lieutenant-general. He was sent in 1731 with a squadron into the Mediterranean, with which he subdued the piratical states of Barbary, and settled the commercial affairs of the nation at Smyrna and other parts of the Levant. He died at Paris in 1736. His Memoirs, written partly by himself, and partly by his nephew M. de la Garde, were printed at Paris, in 1740.

Guazuma, f. in botany. See Theobroma.

Gubbins, f. [gobeau, Fr. a mouthful.] Fragments, parings of haberdine, cod-fish, &c.

Gubbio, a town of Italy, in the diocese of Urbino, the see of a bishop holding immediately from the pope. Here are seven churches, and twenty-one convents. In 1751, it was much shaken by an earthquake; thirty-three miles south of Urbino, and thirty-one north of Spoleto.

Guebriate, a town of Egypt: eight miles north of Athif.

Guebri, a town of Bohemia, in the circle of Chrudim: fifteen miles north-east of Luničefch.

Guebri, a town of Leatia, on the Lune, or Lube, which soon after joins the Neis, surrounded with walls in 1535. It contains three churches and an hospitall; good wine is made here, and there is a manufactory of cloth: twenty-two miles south of Frankfort on the Oder, and seventy north-north-east of Drefden.

Guber, a river of Prufia, which runs into the Aliverado; near twenty miles south of Carlowitz, and forty miles north-north-east of Nifan. Guber, a kingdom in the interior part of Africa, on the banks of the Niger. Lat. 15° 15' N. Lon. 8° 30' E. Greenwich.

Guberskia, a fort of Ruflia, in the government of Kutcha, on the Ural: 120 miles east of Orenburg.

Gubernation, f. [gubernatio, Lat.] Government; superintendence; superior direction. Perhaps there is little or nothing in the government of the kingdoms of nature and grace, but what is employed as a medium or conscious instrument of this extensive gubernation. Watts.

Guensberg, a town of Germany, in the circle of the Upper Rhine, and principality of Helfe Caffel: about 25 miles south of Caffel, and four north-north-east of Fritzlar.

Gudgeon, f. [gudgeon, Fr.] See the article Cyprinid, vol. v. p. 531, and the correfpondent engraving. A small fish found in brooks and rivers, easily caught, and thence made a proverbial name for a man easily cheated.

'Tis true, no turbots dignify my boards.

But gudgeons, founders, what my Thames affords.

Pope.

A man easily cheated.—This he did to draw you in, like to many gudgeons, to swallow his false arguments.

Swift. —Something to be caught to a man's own dislike.

For this fool's gudgeon, this opinion. Shakespeare.

With ship-builders and mill-rights, a kind of staple or medium or conscious instrument of this extensive guber- nation. Perhaps there is little or nothing in the government of the kingdoms of nature and grace, but what is employed as a medium or conscious instrument of this extensive gubernation. Watts.
GUE

GUE'DE LONGROY, a town of France, in the department of the Bure and Loire: three leagues and a half north-east of Chartres, and four miles of Donnard.

GUE'DE VELUIRE, a town of France, in the department of the Vendee, and chief place of a canton, in the district of Fontenay-le-Compte: eight miles south-fourth-west of Roye.

GUE'BERFWEIR, a town of France, in the department of the Upper Rhine: one league north-north-west of Ruffach, and one and three quarters south-fourth-west of Comlar.

GUE'BUIVILLE, a town of France, in the department of the Upper Rhine: eight leagues and a quarter north-north-west of Bale, and three and three quarters south-west of Colmar.

GUE'CANN, a river of Spain, which runs into the Xnjar a little below Cuenca.

GUE'DALL, a river of North Wales, in the county of Montgomery, which runs into the Dume two miles above Machynleth.

GUE'DRIER' DE ST. AUBIN' (Henry Michael), librarian of the Sorbonne, born at Gourriai-en-Bray in 1655. He pursu'd his studies at the university of Paris, and was received a member of the Sorbonne in 1723. He was intimately conversant in the Greek, Hebrew, English, and Italian, languages, as well as the different branches of knowledge requisite for a divine morality. For fourteen years he was frequently confined, and held in high esteem as the solver of difficult cases of conscience. He died in 1742, at forty-seven years of age. He was the author of a work entitled The Sacred History of the Two Covenants, published in 1727, 7 vols. 12mo. exhibiting the harmony of the Old and New Testaments, interpersed with learned dissertations, judicious criticisms, and useful reflections, drawn up in an elegant felicity of style.

GUE'GON, a town of France, in the department of the Morbihan, and chief place of a canton, in the district of Josselin: half a league south-west of Josselin.

GUE'ELDERLAND (Duchy of), a country of Europe, bounded on the north by Overijssel and the Zuyder Zee, and by the river Meuse, and the counties of Gelders and Brabant, and on the west by the districts of Utrecht and Holland. It was erected into a county by the emperor Henry IV. and in the twelfth century one of the counties added to the dominions of the House of Burgundy. In 1339, Guelderland was erected into a duchy, by Louis of Bavaria, and passed to different families, to that of Juliers, Egnion, and at length to the dukes of Burgundy. In 1579, what now forms the prefecture of Guelderland, that is, the quarters of Nimmenge, Zutphen, and Arnhem, were annexed to the duchy of Cleves, by the union of Utrecht. Each of these quarters had its particular states, composed of the nobility and the towns, and these two classes had equally a right to make propositions relative to government. To the assembly of the states general of the United Provinces, Guelderland sends nineteen deputies. The chief tribunal, with the chambers of accounts belonging to the province, are kept at Arnhem. Some part of Guelderland, including the towns of Guelders, Wachtenbonk, Staaff, and some villages, was ceded to Prussia, by the treaty of Utrecht, with the reservation of the religious rights of the inhabitants. The towns of Ruymond, with the territory round it, remained to Spain, as from the time of the House of Austria.

GUE'LDER-ROSE, J. A species of Viburnum, a flowering shrub.

GUE'ELDRES, a town of Guelderland, ceded, with Vol. ix. No. 567.
cient manuscripts among the libraries belonging to the different religious houses in that province; of which he found a considerable number, and among others the treatise of Augustine against Julian, entitled Imperfectum Orationis, which was the third copy of that work then known to exist in Europe. Of this manuscript he sent an accurate transcript to his brethren at Paris, who were engaged in editing St. Augustine's works. From Ambournay his place of exile was changed to Fecamp, and afterwards to Rouen, where he died in 1715. He was the author of An Abridgment of the Bible, in the Form of familiar Questions and Answers, with Illustrations collected from the Fathers and the best Interpreters, 1707, in 2 vols. 12mo.

GUERIVE (La), a town of France, in the department of the Cher, and chief place of a canton, in the department of Sancoins: seven miles north of Sancoins.

GUERIVE (La), a town of France, in the department of the Ille and Vilaine: three leagues and a half south of Vitre, and six and a half east-fourth-east of Rennes. Lat. 47° 57' N. Lon. 16° 26' E. Ferro.

GUERIVÉ (La), a town of France, in the department of the Cher, and chief place of a canton, in the department of Sancoins: seven miles north of Sancoins.

GUERIVÉ (La), a town of France, in the department of the Ille and Vilaine: three leagues and a half south of Vitre, and six and a half east-fourth-east of Rennes. Lat. 47° 57' N. Lon. 16° 26' E. Ferro.

GUERDONABLE, adv. Fit to be rewarded.

GUERDONLESS, adv. Unrewarded.

GUERET, a town of France, and capital of the department of the Creuse, situated near the source of the Garonne, between two mountains, at some distance from the Creuse. The air is thievish, and gives the inhabitants a heavy melancholy appearance; the number is about three thousand: nine pofts and a half north-west of Limoges. Lat. 46° 10' N. Lon. 19° 33' E. Ferro.

GUERET (Gabriel), a man of letters, born at Paris in 1631, and admitted advocate of parliament in 1660. He made himself known early by his literary publications, the first of which was Les Sept Sages de la Grece. His Entretiens sur l' Eloquence de la Chaire & du Barreau contain judicious reflections, though it is disparaged by Voltaire. He obtained most reputation for his two poetical works, Le Parasse Réformé, and its sequel, La Guerre des Auteurs. Of the fame class is La Carpe de la Cour, an ingenious allegory; and La Promenade de St. Clovis, in which Boileau was satirified. He was the author of several treatises in natural philosophy, the principal of which is entitled, Experimenta Magdeburgica, 1672, folio, and contains his experiments on a vacuum.

GUERIGNY, a town of France, in the department of the Nievre, and chief place of a canton, in the district of Morlaix: three leagues and a quarter south-east of Morlaix, and four and three-quarters north of Carhaix.

GUERMANGE, a town of France, in the department of the Meurthe, and chief place of a canton, in the district of Dieuze: one league and a quarter east of Dieuze, and three and a quarter west of Sarburg.

GUERNADAS, a town of the island of Cuba: thirty-two miles east-fourth-east of Spiritu Santo.

GUERNSEY, an island in the English Channel, on the coast of Normandy, subject to Great Britain, but governed by its own laws, which are a remnant of the old Norman, to which country the island formerly belonged; but it is now made parcel of the county of Hampshire, and dioecese of Winchester, although the French language is there universally made use of. It lies twenty leagues south-west from Weymouth in Dorsetshire, between eight and nine leagues west from the coast of Normandy, thirteen south of Bretagne, seven north-west from Jersey, five south-west from Alderney, and three leagues west from Sark. It extends from east to west in the form of a harp, and is thirteen miles and a half from the south-west to north-east, and twelve and a half from the south-east to north-west in the form of a crescent, enclosing a bay capable of receiving very large ships. The island is well fortified by nature with a ridge of rocks; one of which abounds with emery, used by lapidaries in polishing of stones, and by various other artificers. Here is a better harbour than any in Jersey, which occasions its being more resorted to by merchants; and on the south side the shore bends in the form of a cresent, enclosing a bay capable of receiving very large ships. The island is full of gardens and orchards, where the most common people use it instead of small-beer, but the more wealthy drink an inferior sort of French claret.
There are very few countries in the world where the inhabitants have more reason to be satisfied with the inheritance that nature has assigned them, since scarcely any part of the island is incapable of improvement. Most of the rising grounds afford a short thick grass, equal in beauty to the eye, and succulent as well. It produces excellent roots and herbs of all kinds, as well medical, as for provisioning, with flowers that grow wild, and are exquisitely fragrant. All sorts of shrubs and fruit-trees flourish here; and there is that grow wild, and are exquisitely fragrant. All sorts of flowers is divided into several distinct parts, for the more easy

secure to the shipping, but being paved with fine flag

rity to the ship, affording a very pleasant parade for the inhabitants, affording a fine prospect of the sea, and of the adjacent islands. This commodious port is covered by Caffle Cornet, built entirely upon a rock, at six hundred paces from the shore; so that at full sea a fair port of the island, and the space between it is fearfully passable at the low-ebb after spring tides. This is the residence of the governor, or deputy-governor, and his garrison. It was blown up by lightning in 1672, when lord vicecount Hatton held that office, who escaped himself, almost unscathed, but lost his mother and his wife. The woollen is their principal manufacture, for the carrying on of which they are allowed to import two thousand tons of wool annually from England, which they work up chiefly in stockings, waistcoat pieces, &c. They might certainly make their fishery turn to profit, more especially as of late years they have set up salt-works; but these objects seem to give way to a very considerable trade which the inhabitants carry on with Newfoundland and the Mediterranean.

The several iflets, and vast chains of rocks, that surround this country on every side, and caust such variety of tides and currents, add much to the security of the place, by rendering it equally difficult and dangerous for ships to approach it, unless they have pilots on board acquainted extremely well with the ports, though they have not either lime, chalk, or marl, yet sea-weeds answer all the purposes of manure, so

that the old writers say, it looks like a park in the sea

1. The harbour, which is called Port St. Pierre, or Port

of the Sound, De Chaupe, is singularly commodious. Ships pass into it from a very good road, directly under the guns of the castle, and near close to the town. The piers, or caufeways, are composed of vast stones, piled up very artificially, one upon another, to thirty-five feet in height, and laid with so much skill and regularity, that it has filled all the violence of the wave between four and five hours after the left of spring... This not only affords security to the shipping, but being paved with fine flag stones on the top, and guarded with parapets, serves as a very pleasant parade for the inhabitants, affording a fine prospect of the sea, and of the adjacent islands.

This commodious port is covered by Caffle Cornet, built entirely upon a rock, at six hundred paces from the shore; so that at full sea a fair port of the island, and the space between it is fearfully passable at the low-ebb after spring tides. liberty upon ransom, who again entered into the service of Henry, and greatly contributed to fet him on the throne. For his reward he was made confable of Caffi- 
tile, duke of Montferrat, and count of Burgos. After the 
subsequent rupture between the French and English, he 
returned to the affiftance of his own king, who, in 
1370, entrucked him with the sword of confable. By 
activity and enterprife he recovered all Poitou, Anais, 
and Saintonge. He next attacked Montfort duke of 
Britany, and obliged him to take refuge in England. 
That prince being afterwards relieved to his dominions, 
suspicious were thrown upon the confable as having 
favoured him, and he was for a time in disgrace. The 
king, however, became fenfible of the injustice done 
him, and the dukes of Bourbon and Anjou were sent to 
bring him to court. He was placed again at the head of 
the troops in the southern provinces, where the 
English had rallied their forces, and laying siege to 
Chateau-neuf de Rendar in Auvergne, he was attacked 
with a mortal difeafe. He soon afterwards expired, in 
July, 1380, at the age of sixty-nine. The English garri-
son, which had conditioned to surrender at a certain 
time, if not relieved, marched out the day after his 
deth, and the commander respectively laid the keys of 
the fortrefs on his bier. His body was conveyed to 
St. Denis with all the ceremonies used to sovereigns, 
and deposited in the tomb next to that of the king. 
His greatest captains refufed to take the sword of con-
fable after it had been borne by such a hero. 

To GUESS, v. a. [ghefien, Dut.] To conjecture; to 
judge without any certain principles of judgment. 
—You cannot guefs who caused your father's death. Shakespeare.

Nor can imagination guefs, 
How that ungrateful charming maid 
My purest fillown has betray'd. Swift.

To conjecture rightly, or upon some just reason.—One 
may guefs by Plato's writings, that he himself had a 
right opinion concerning the true God. Stillingfleet.

To GUESS, v. a. To hit upon by accident; to deter-
mine rightly of any thing without certain direction of 
the judgment.—If Xerxes was able to call every com-
mander respecting the city, the keys of the forterfs on 
his bier. His body was conveyed to St. Denis with 
all the ceremonies used to sovereigns, and deposited 
in the tomb next to that of the king. His greatest 
captains refused to take the sword of confable after it 
had been borne by such a hero.

GUEST, f. [guest, Arch. & L.] A stranger; one who comes 
newly to reside: one who comes newly to reside: a 
stranger; one who comes newly to reside.

GUEST-CHAMBER, f. Chamber of entertainment. 
—Where is the guef-chamber, where I shall eat the 
pafl

ance of the remarkable comet in the years 1680 and 1681, he published a treatise, **Aquarum Fluctuum Mensuratio**, by the university of Bologna. Upon the appearance of the remarkable comet in the years 1680 and 1681, he published a treatise, De Cometarum Natura & hoc simile.
G U I A N A.  

Guiana, a very extensive country of South America, bounded on the north by the provinces of Venezuela and New Andalusia; on the east and north-east by the Atlantic Ocean; on the south by the river of the Amazonas; and on the west by New Grenada: 1100 miles in extent from east to west, and from 300 to 600 in breadth, and the difficulty will have been formed on the sea-coasts by the Dutch, by the French, and by the Portuguese; the latter have been united to the government of the Brazils, and are now considered as part of that country. Dutch Guiana is bounded on the east by the river Mararivana, and on the west by Cape Natalie; and contains several settlements of Surinam, Berbice, Essequibo, and Demarary, all of which are now (1807) in possession of the king of Great Britain. French Guiana is situated between the rivers Mararmina to the north-west, and Oyapoco to the south-east, and goes by the name of Cayenne, from the Island so called, which produces the much more noted Cayenne pepper.

The inland part of Guiana is but little known. Alphonso de Ojeda first landed in this country in 1499, with Americus Vespucius, and John de la Cofa. He went over a part of it; but this expedition afforded him only a superficial knowledge of so vast a country. Many others were undertaken, at a greater expense, but served only to fill more of our Guiana. But its origin could not be discovered, that, in the interior parts of Guiana, there was a country known by the name of El Dorado, which contained immense riches in gold and precious stones; more mines and treasures than ever Cortez and Pizarro had found. This fable not only inflamed the ardent imagination of the Spaniards, but fired every nation of Europe. Sir Walter Raleigh, in particular, determined, in 1595, to undertake a voyage to Guiana; but he returned without discovering any thing relative to the brilliant object of his voyage.

Mr. Locheed, in his Natural History of Guiana, published in the Edinburgh Transactions, vol. iv. gives the following interesting account of the creeks and rivers, as explored by himself, in that country. "A number of creeks fall into the Demarary on both sides, but do not bear the same proportion to the size of the river. You can hardly distinguish their mouths in the woods which overhang the banks. They are so narrow that it is difficult to run a large boat in them; though you will find in them throughout from two and a half to four fathom; and they run winding so far back, that it will take five, six, eight, hours, or more, to carry you up to their heads, where they terminate in small streams from among the sand-hills. The banks of the creeks at their mouths are of the same height as those of the river itself, by, from five perhaps to twelve feet above the water in the dry season. As you ascend the creek, you might naturally expect to find them rise: it is, however, the very reverse; they become gradually lower and lower, till at last all round them is a swamp; and the trees, on each side, in like manner become fewer and smaller, and of different species from what they were. It is in part, from the nature of this swamp, with this difference, that the water is quite fresh, the vegetables are not the same, and there are abundance of arums and other low herbaceous plants. A little higher up, you lose the wood altogether, and find yourself in a beautiful deep channel, winding through a spacious wet savannah, which is sometimes many leagues in circumference. The first time we went up one of these creeks, called Camouni, I was surprized at this appearance, and thought it must be a mere local phenomenon peculiar to it. We found afterwards the same in one or two more instances, and were satisfied upon inquiry, that it is common to them all. It was natural to look for an explanation of this phenomenon, and I soon found it in one of those laws, which probably extend to all rivers subject to frequent inundations. It has been observed, in particular, of the Ganges, that the banks of that river are higher than the adjacent lands at a distance from the stream, owing, no doubt, to the annual depositions of mud, &c. during the swell of the river. Apply the same rule to the Demarary; and you will find the same to be the case. Several creeks, that run into the savannah behind, and the swampy woods around them, are the body of the low country at its natural level, scarcely a foot or two above the sea. Whatever additional height the land has in the vicinity of the river, from the time you have ascended about twenty miles, is all swept off. It has arisen from the sediment of the river during the rainy season, when the country is overflowed so as to make all the lower part of it is under water. This deposition must be always more copious, in proportion as it is nearer the stream, where additional quantities are always brought, and where it is kept in motion both by the current and the tide. Every thing which we afterwards saw confirmed this theory, and nothing more directly than the canals which run out at right angles from the river. Some of these extend four miles inward, and they prove to a demonstration, that the land becomes lower and lower the farther you recede from the river. The maps of the colonies confirm it; for in all of them the main body of the low land is found to the west; and the woody country, which a stranger or superficial observer would suppose to be the whole or much the greater part of it, is in fact only a border on the sides of the rivers and of the sea, but of considerable breadth, more or less, in proportion to the size of the adjoining river, or, which is generally the same thing, to the acquired height and extent of the soil on this land. It is not only the case with the Guiana, that its noble stream has been so long hid from science. What I learned in Trinidad from a gentleman, who had failed from its mouth to the Anguifers, about three hundred miles up, confirms and illustrates, in the fullest manner, the above general rule. The western mouths of it, opposite Trinidad, are navigable only for launches drawing six or seven feet water. At first you have the mangrove, or some similar swamp, resembling, in all respects, that of Guiana. You must ascend these branches several days before you reach the main stream; and, in doing so, you find the same phenomena as in ascending the Demarary, but in a still greater degree. At first you have the mangrove, or some similar swamp, and behind it, on both sides for about twenty leagues, the land, if you can call it so, hardly emerging from the water. Afterwards the ground appears; and, as you go up, rises still higher and higher on the banks above the common level of the stream. The trees come, in the same manner, of different species, and much taller than they were below. The channel in which
which you are, from being wide grows narrower by de-
grees. It is from about one and a half to three-fourths
of a mile broad near the entrance; and, when it joins
the main stream, is not more than about two hundred
yards. It is navigated by canoes and flat-bottomed
vessels; and the banks may be about twenty feet high. Along
the main stream of the river, or Boca de Naños, the gra-
dual rise, and other circumstances attending it, are
quite similar. All this height of the bank is entirely
acquired ground, formed by the sediment of the floods,
greater near the streams than at a distance from them;
and through I have no knowledge of their depth, the
land in the Deltas and their vicinity, I would not he-
fiate to say, that great part of the interior body of each
island, and most probably of the main on either side,
where it is low country, consists of nothing else than
wet savannahs.

The inhabitants of Guiana are either native Indians,
who are of a reddish-brown; or negroes and Europeans;
or a mixed progeny of these in various combinations.
The natives are divided into different tribes, more or
less enlightened and polished, as they are more or less
remote from the settlements of the Europeans. They
allow polygamy, and have no division of lands. The
materials which they use for weaving, for pottery, and the
look after domestic concerns, spin, weave in their fash-
on; and manage the planting of caflava and mani-vee, the only
thing which in this country are cultivated by the na-

tions of Christianity. If missionaries were honest, we should probably be presented with many accounts of Oyapock, where the torrent forms a magnificent cascade. I found an old soldier, who had served under Louis XIV. and had obtained a pension in consequence of a wound which he received at the battle of Malborne. His figure, though not in his voice, were those of a robust man; and a long white beard hung down to his middle. His society consisted of two old negro women, who maintained him by the produce of their fishery, and of a small garden which they cultivated on the bank of the river. He spoke of a wound which he received at the battle of Malborne, and whose door he had stood sentinel at Cambray. He had arrived at Cayenne in 1730, where he had been employed as esclave by the Jesuits, who were at that time the only opulent proprietors, and he himself was then in very easy circumstances. I offered to convey him to the fort, but he objected, saying that the noise of the trade-winds by day, the land-breezes in the evening, and the invariable length of the days, with gentle dews, refreshed the air, and rendered it comparatively temperate and salubrious. There are two wet seasons and two dry, of three months each, in every year; and, during more than a month in each wet season, the rain is incessant. The dry seasons commence six weeks before the equinoxes, and continue six weeks after. The wet seasons are the most favorable, because the rains keep the waters that cover the low lands, next the sea, fresh and in motion; but during the dry seasons, the rains are light and intermittent, and the waters are the causative, and cause of many of the droughts and fires. In consequence of the swampy soil and moist atmosphere of this region, it presents a vigour and exuberance of vegetation almost without parallel. All the usual tropical productions, except those that delight in dry and sandy tracts, are found here in full perfection. Beside the common species of palms, there are two which are almost peculiar to this part of America, but which, having been discovered, are now cleared of their impenetrable forests.
which, together with many other of the native plants of Guiana, have not yet found their way into the Linnean system. One of these, called the cacalito palm, resembles its hard splintery wood, of which the fihall poisoned arrows are constructed. The other, the manioco palm, grows only in the deepest and most fertile soil, where it attains the height of fifty feet, while its stem in the thickest part is scarcely nine inches in diameter. The annato (Bixa orellana) seems to be here in its original habitat, as appears from its magnitude of growth and brilliancy of colour. The quassia, whose intense bitterness is familiar to English palates, and the quassia imarobou, a medicinal drug of great efficacy, are also natives of Guiana; nor ought we to omit the mention of the ricinus or castor-oil nut, the castilla palm, the cowage (Callicarpa provries), the balcam of capivi, and ipecacuanha. The herbaceous plant noticed above the name of trooddles, grows here in abundance; the leaves are the largest of any yet known; they lie on the ground, and have been found of the length of thirty feet, by three feet in width: so admirable a material for covering has not been bestowed on this country in vain; most of the houses in the settlements are thatched with it, and it will last some years without requiring repair. The elastic gum, called caoutchouc, is produced from a large tree inhabiting French Guiana; and here it is used for vessels of various kinds, and for torches. A small tree called carana, yields a farinaceous nut, from which the Wabigas of the Carib produce their certain though protracted instrument of jealousy or revenge. Still more certain, because more rapid, is the Ticuna poison, the dreadful equal of that from Manigua, which he left with them at parting above 190 of St. Germer, where he took the habit. In 1104, he was elected abbot of Nogent-Sous-Cour, in the diocese of Meaux, where he died in the creation. This volume was dedicated by Dom. Luc. d'Achery in 1651, folio. They content of his life, a treatise on preaching, another on revelations, and several other curious pieces, of which the most valuable is his history of the first crusade, commonly entitled Gesta Dei per Francos. This is an interesting performance, written in a lively style, and containing much valuable narration.

GUYBERT (Jacques-Antoine-Hypolite), a distinguished writer on military subjects, son of an officer of rank and merit, born at Montauban in 1743. At the age of thirteen he accompanied his father to the war in Germany, and served with him in campaigns, during which he was present at most of the actions which occurred. On the return of peace he applied diligently to the study of military tactics, to which he was enthusiastically devoted. He refumed the practice of it in the war of Corsica, where he served under the marshal de Vaux, who placed great confidence in his talents. His great share in the decisive victory at Ponte Nuovo procured him the commission of colonel, and upon his return he was honoured with the cross of St. Louis. Soon after, he was appointed commandant of a corps raised under the title of the Coriscan legion. In 1790, he published his grand work, Essai Général de Tactique. After an elegant and philosophical preliminary discourse, and an introduction, the author takes up the tactics of engagements, and the certain though protracted instrument of jealousy or revenge. Still more certain, because more rapid, is the Ticuna poison, the dreadful equal of that from Manigua, which he left with them at parting above 190 miles north of St. Jago.

GUYBARA, a town of Terra Firma, on the Curacoa coast. Its harbour is 121 miles east of Maracaibo, where, in the years 1739 and 1743, the British were repulsed, and left four men in attacking this place. Lat. 10. 39. S. Long. 66. W.

GUIBA, a town of the island of Cuba; sixty-five miles north of St. Jago.

GUILBARA, a river of Ireland, in the county of Donegal, which runs into the Atlantic: thirteen miles north of Kilbeggan.

Guilielmus, a celebrated abbot and historian, born in 1053, of a distinguished family in the diocese of Beauvais. At the age of twelve he entered into the monastery of St. Germer, where he took the habit. In 1104, he was elected abbot of Nogent-Sous-Cour, in the diocese of Meaux, where he died in the creation. This volume was dedicated by Dom. Luc. d'Achery in 1651, folio. They content of his life, a treatise on preaching, another on revelations, and several other curious pieces, of which the most valuable is his history of the first crusade, commonly entitled Gesta Dei per Francos. This is an interesting performance, written in a lively style, and containing much valuable narration.
lightened philanthropy. One of his nephews was killed at the battle of Aoukis, of whom Bonaparte thus speaks in his public dispatches: "We lost a hundred men, among whom were the adjutant-general Letourc, the chefs de bриgade Duvivier and Cretin, and my aide-de-camp Guiccardi. I had not lost my confidence in the fourth!"

GUICCARDINI (Francis), an historian of great eminence, born of an ancient and noble family at Florence, in 1482. After pursuing his studies at Pisa, Bologna, and other universities, he was engaged at the age of twenty-three to read lectures upon the Institutes at Florence. His inclination, however, leading him to public affairs, he quitted his chair, and in 1504 a was ambassador from the Florentine republic to Ferdinand king of Arragon. In 1518, he was deputed to meet pope Leo X. at Cortona, where that pontiff was imprifoned with so favourable an opinion of his talents, that he created him consular advocate, and committed him to the government of Modena and Reggio. In 1524, he was also made governor of Parma, which city, as well as that of Reggio, he successfully defended against the French. In 1529, pope Clement VII. conferred upon him the presidency of all Romagna, and afterwards nominated him lieutenant-general of the papal army; but he was not fortunate in protecting his sovereign from the imperial arms. From 1529 to 1534, he was governor of Bologna, and in that time exerted himself confiderably to reftore the Medici family in Florence. After the death of Clement, he refused the offers of Paul III. to engage him in his service, or, as some affirm, was deprived of his government by that pontiff: he returned to his native city, where he was made counsellor of state to duke Alexander. After his decease, Guiccardini employed his influence in procuring the succeffion of Cosimo; but not thinking himself sufficiently confidered by the new duke, he retired to his villa of Arcetri, and died in May 1545, in the fifty-ninth year of his age. His great works, the History of Italy during his own Time, did not appear till many years after his death; which delay is imputed to the freedom of its strictures upon several persons then living, and the danger of offending many powerful families. It was not till 1561 that the first sixteen books were published by his nephew Agnolo; and three years afterwards, the four remaining ones appeared at Venice. But in this and all the subsequent Italian editions various omissions were omitted. An edition dated at Friburg, 1755, in 4 vols. 4to. from the author's own manuscript in the Maggliabecchia library at Florence, supplies all the omissions; and is generally allowed to be one of the most valuable productions of that age, and a monument to Italian literature. The author had likewise a talent for poetry, and some of his verses are preserved by Crefcembini.

'GUICCIARDINI (Louis), nephew of the preceding, born at Florence in 1551. He was brought up to letters; and in 1599, on what account is not known, took up his residence in the Low-countries, where, chiefly at Antwerp, he continued till his death, in 1589. He wrote various works in Italian, of which the most valuable is A Description of the Low-countries, Antwerp, 1567 and 1568, folio, which is in great esteem for the accuracy of its relations; and no part of Europe at that time contained more objects of political and commercial interest. His other works were a Commentaries on the Affairs of Europe, particularly in the Low-countries, from 1539 to 1560, Antwerp, 1569. 3. Detti & Fatti notabile de Diversi Principi, &c. Remarkable Words and Actions of Princes, &c. 4. Ore di Recreazione: Hours of Amusement; and a collection of the precepts and maxims of historical personages.

GUICHE (La), a town of France, in the department of the Saône and Loire, and chief place of a canton, in the district of Charolles: three leagues and a quarter north-north-east of Charolles, and three and a half north-west of Clany.

GUIQUELLEAU', a town of France, in the department of the Finiferre, and chief place of a canton, in the district of Lefneven; one league west-north-west of Lefneven.

GUIDAGE, f. The reward given to a guide. Aisf. GUIDANCE, f. Direction; government. A prince ought not to be under the guidance or influence of either faction, because he declines from his office of presiding over the whole to be the head of a party. Swift.

This to the young—but thy experience'd age
Wants not the guidance of a former sage. Swift.

To GUIDE, v. a. [guider, Fr.] To direct in a way—When the spirit of truth is come, he will guide you into all truth. Je. xvi. 13. Whosoever has a faithful friend to guide him in the dark passages of life, may carry his eyes in another man's head, and yet fee never the worse. South.—To influence. Upon thee, of such-like peculiar maxims, when nothing but intereft of this world guides men, they many times conclude that the flightest wrongs are not to be put up. Kettlewell. —To govern by counsel; to instruct. For thy name's fake lead me and guide me. P. xxxi. 3.—To regulate; to superintend. —Women neglect that which St. Paul assigns them as their proper business, the guiding of the house. Decay of Piety. GUID, f. [guider, Fr. from the verb.] One who directs another in his way.—Thou gavest them a burning pillar of fire to be a guide of the unknown journey. Wijd. xviii. 3.

Can knowledge have no bound, but must advance
So far to make us wise for ignorance?
And rather in the dark to grope our way.
Than, led by a falfe guide, to err by day. Denham.

One who directs another in his conduct.—They have all the same pastoral guides authorized and set apart by the appointment of God. Pearce.

While yet but young, his father dy'd,
And left him to an happy guide. Waller.

Director; regulator. —Who the guide of nature, but only the God of nature? In him we live, move, and are. Hooker.

Some truths are not by reason to be tried,
But we have sure experience for our guide. Dryden.

GUIDE, a town of France, in the department of the Morbihan, and chief place of a canton, in the district of Hennebon: five miles north-west of l'Orient.

GUIDE, a town of France, in the department of the Finiferre, and chief place of a canton, in the district of Quimperle: one league and three quarters south of Quimperle, and five and a half east-south-east of Concarneau.

GUIDELESS, adj. Having no guide; wanting a governor or superintendant:

There fierce winds o'er dusky valleys blow,
Who'le every puff-bears empty shades away,
Which guideless in those dark dominions stray. Dryden.

GUIDER, f. Director; regulator; guide. Obsolète._—Our guider come! to the Roman camp conduct us. Shakespeare.

GUIDI (Alexander), an Italian poet of eminence, born at Pavia in 1630. At an early age he went to the court of Rannuccio II. duke of Parma, by whom he was much favoured and esteemed. At the age of thirty-one he published some lyric poems, and a drama entitled, Amalasunta in Italia. He afterwards visited Rome, and frequented the court of the abdicated queen Chiffiain, who employed him to compose a piece for music to celebrate the accession of James II. of England. This was in the form of a dramatic pastoral, entitled, Endymion, and she designed to infect some lines in it of her own composition. His poems in general are full of vigour and enthusiasm; and he is accounted one of the few

GUIDE,

GUIDELESS, adj. Having no guide; wanting a governor or superintendant:

There fierce winds o'er dusky valleys blow,
Who'le every puff-bears empty shades away,
Which guideless in those dark dominions stray. Dryden.

GUIDER, f. Director; regulator; guide. Obsolète._—Our guider come! to the Roman camp conduct us. Shakespeare.

GUIDI (Alexander), an Italian poet of eminence, born at Pavia in 1630. At an early age he went to the court of Rannuccio II. duke of Parma, by whom he was much favoured and esteemed. At the age of thirty-one he published some lyric poems, and a drama entitled, Amalasunta in Italia. He afterwards visited Rome, and frequented the court of the abdicated queen Chiffiain, who employed him to compose a piece for music to celebrate the accession of James II. of England. This was in the form of a dramatic pastoral, entitled, Endymion, and she designed to infect some lines in it of her own composition. His poems in general are full of vigour and enthusiasm; and he is accounted one of the few
few Italian poets who have happily transfused into the language the fire and vehemence of Pindar. He attempted a tragedy, but was dissuaded by proceeding by his friends, who thought his genius not fitted for that attempt. Then began a version of the Phaëthon, which labour was interrupted by a call he received from prince Eugene, governor of Lombardy, to assist in a plan for diminishing the public burdens. In this business he succeeded so well, that he was enrolled in the number of Paveze patricians. He died at Firenze, 1628.

GUIDI (Guido), called Fidus Vidian, an eminent physician of the sixteenth century, born at Florence. After practising for some time in his own country, he went about 1542, to France, where he was graciously received by Francis I. who assigned him a pension, and made him his first physician, and professor of medicine in the College Royal. After the death of Francis, he was recalled into Italy by duke Cosimo I. who nominated him his first physician, and gave him the chair of philosophy, and then of medicine, in the university of Pisa, which he occupied for twenty years. He was rewarded with several ecclesiastical benefices, which was then a common mode of acquiring considerable fortunes, and other men of learning. He was much esteemed by the literary characters of his time, and in 1553 was made confid of the Florentine academy. He died in 1569. Guidi published at Paris, in 1544, a splendid edition of the Greek surgeons, translated into Latin, folio, with critical and parallel notes of six and seven years. For his nephew, Guidi Guidi the younger, also a professor of Pisa, published his posthumous works, consisting of Ars Medicinalis, on the practice of physic, in two parts, and Chirurgia, in four books. One of the books of this work contains the Anatomy of the Human Body, and has the figures of Vesalius and the discoveries of Fallopio, with several things of the writer's own. The whole works of Guidi, or Vidian, were published at Frankfort, 1626, 1645, 1677, folio.

GUIDICCIONI (John), an Italian poet and prelate, born at Lucca in 1300. After having received an education in various universities of Italy, he was placed by his uncle, cardinal Bartholomew Guidiccioni, in the service of cardinal Alexander Farnese, afterwards pope Paul III. He there cultivated the friendship of all the men of letters with whom Rome abounded, and especially of Annibal Caro. He retired to his native place in 1553, but in the next year was recalled to Rome by his patron, and invested by him with the government of Follombrone. In 1553 he was sent nuncio to the emperor Charles V. whom he accompanied in his expedition to Tunis, and on other journeys. He was made president of Romagna in 1559, and afterwards commissary-general of the pontifical army, and governor of the Marche; he would probably have been raised to the purple, had he not been carried off by disease at Macerata in 1541. He was the author of an oration to the republic of Lucca, of many letters, and of a number of poems, which obtained a high reputation. His works have been several times published; an edition was given by Bernardi with his Life, in 1749, Genoa. The best edition of his poems is that of Bergamo, in 1553, by Giamb. Rota.

GUIDO (Remi), an inimitable painter, born in 1575, at Bologna, where his father was an eminent musician. Showing an early taste for design, he was placed with Deen Calvinart, where he soon became a skilful artist. In his twentieth year he entered the school of Guido Carracci. The strong manner of Caravaggio was then popular, and Guido followed it, till he was told by Annibal Carracci (it is supposed through jealousy), that a reputation might be raised by adopting one the direct reverie. Upon this he took up his own delicate manner of investigating the beautiful in nature; and he acquired that grace and elevation in the airs of his heads, that almost divine expression, and that elegance and facility of touch, which were his distinguishing characteristics. He accompanied Alberti to Rome, in order to study the works of the greatest masters of his capital, and though all possible ill offices were done him through the jealousy of Caravaggio and others, his works spoke for him so powerfully that he soon established his reputation. Pope Paul V. chose him to paint his private chapel of Monte Cavallo, and furnished him to be covered with his presents. Indeed, in his professional character, no artist held higher either the art itself, or his own rank in it. He worked with a kind of ceremonial, splendidly habited, and served by his pupils, who were ranged round him in silence. He set no price upon his pictures, and received the remuneration sent him rather as an honorary reward. He returned no visits paid him by the great; saying that when they came to see him, it was not on account of his person, but of the talent which God had given him. Besides his inimitable works in Rome, he was engaged in many splendid pieces for Genoa, Ravenna, Naples, and other towns in Italy. He might have accumulated wealth as well as fame, had it not been for an unfortunate propensity to gaming, which, notwithstanding the difficulties and disgraces it brought upon him, he could never conquer. It was the cause that in his advanced years he painted in haste to supply his immediate wants, whence his performances at that period are much inferior to the earlier ones. He had, indeed, a surprising facility and quickness of pen, and he was paid (for a prince of Tuscany) for a fine head of Hercules in two hours, for which he was munificently rewarded. He lived, however, to tire out his friends and creditors, and died at Liff in a melancholy and forsaken condition at Bologna, in 1642, at the age of sixty-seven. This great artist read little, and wrote little, being ignorant even of orthography. His chief relaxation was his harpsichord. He was decent in his manners, social and hospitable. He had a great number of disciples, sometimes two hundred at a time, to whose improvement he was attentive, but from whom he exacted profound obedience. Few names in the art stand higher than his; and his works, which are numerous in churches and palaces, and in private collections, bear a very high value. In grace and beauty they are surpassed by none; and they who, with these qualities, wish for more strength and expression, perhaps desire that which is not to be attained by the utmost powers of imitation. His style is grand, his draughting is unerring, his composition rich, his colouring clear and pure. The celestial character so peculiarly impressed on his figures sufficiently attests his genius. He was acquainted with the arts of engraving and etching, and occasionally practised them. His own works have since exercised the graver of many of the ablest masters.

GUIDO ARETONI. See ARETONI.

GUIDI, n. [French.] A standard-bearer; a standard. Obsolete.—Be thine the guidon, 1 the man at arms.

T. Heywood's Four Prentices.

GUIDONA, n. in botany. See GUARDA, LATIA, and SAMYBA.

GUIDO, a river of Ireland, in the county of Donegal, which runs into the Atlantic five miles south from Bloody Farrell's Point.

GUIENNÉ, before the revolution, a province of France, which made part of the government of the same name; about 160 miles in length, and eighty-five in breadth, of which Borrowdale is the capitol. The word is a corruption of Aquitania, an ancient kingdom and country of great extent, and said by Caesar to be separated from the rest of Gaul by the river Garonne. The word Aquitania, or Aquitaine, is said, and with great probability, to be derived from the abundance of its rivers and springs of water.

GUIERCHE. See GueRmE.
544

GUIGNON, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of Rennes; six leagues north-north-east of Rennes, and four and a half south-west of Rennes.

GUILANDINA, f. [So named in honour of Melchior Guilandinus Wilstad, the subject of the next article.] In botany, a genus of the class decandria, order monogynia, in the natural order of Phanerogamae. (fig. 1.)

The generic characters are—Calyx: perianthium one-leaved, (urceolate or pitcher-shaped, Gartner.) Tube short, turbinate, permanent, with an obtuse mouth; border five-parted, nearly equal, spreading, deciduous; divisions oblong, broader on the outside and rounded; the two upper ones a little shorter, the lowest a little longer. Corolla: petals five, inserted into the neck of the calyx; the uppermost roundish, concave, ascending, a little shorter; the rest oblong, broader in front, rounded at the tip, reflex-spreading, longer than the calyx, and the two lowest a little longer than the middle ones. Stamina: filaments subulate, thicker at the base and villose, decumbent, inserted into the neck of the calyx, shorter than the corolla, unequal; the lower ones gradually longer; anther oblong, affixed to the back. Filament: germ oblong; style filiform, length of the stamens; stigma simple. Pericarpium: legume rhomboidal, the upper future commissure from swelling compressed with transverse partitions. Seeds: bony, globular-compressed, solitary between the partitions.—Essential Characters. Calyx, one-leaved, salver-shaped; petals inserted into the neck of the calyx, nearly equal; seed-veil of a legume.

Species.
1. Guilandina bondouc, yellow bondouc; or nicker-tree: prickly; pinnas ovate, with solitary prickles on the leaflets. See a leaf of this on Botany Plate VI. fig. 3. Leaves near a foot and a half long, composed of five or seven pairs of pinnae, each of which has as many pairs of leaflets, which are ovate and entire; the principal midrib of the leaf is armed with short crooked simple thorns, placed irregularly; the leaflets are also armed with thorns, which are larger. The flanks at first grow erect, but afterwards twine about the neighbouring trees and shrubs. The flowers are in long axillary spikes. Petals equal, concave yellow. Legume broad, thick, three inches long and two broad, closely armed with many flexible spines, opening with two valves, each including two hard seeds, the size of children's marbles, of a yellowish colour. Native of both Indies.

2. Guilandina bondoucella, or grey bondoucella; or double prickles on the leaflets. Differs from the first species in having much smaller leaves, set closer together; and below each pair of leaflets are two short flat crooked spines, which are opposite; the flowers are of a deeper yellow, and the seeds are ash-coloured. Slone, however, affirms that there is no difference between this and the preceding but the colour of the nut, which in the foregoing is yellowish, finely variegated with annular or interrupted fimbriations. The pigment in this is also of a very different nature; the middle lamina is of full red or ash-colour. This weakly plant spreads a great way about the root, or rises among the neighbouring bulbes, if it finds a due support. The flanks and branches are very full of thorns that arch backwards. The seeds are grey, and commonly used instead of marbles, by boys, in the foraging colonies. In Egypt, where the nuts are used by the women, inrung in necklace, and hung about their children, by way of amulet, to guard them from forcery. They are often cast on shore on the north-west coasts of Ireland and Scotland, and are called by the inhabitants of the latter Molucca beans. This tree makes a good timber; it is a native of both Indies, China, and New Zealand; and was cultivated by Mr. George Verheyen at Stratford-le-Bow, before 1640. He raised it from feed brought from the West Indies to the height of three or four feet, but it perished the next winter. This kind of bondouc is called beazor nasi, and says that they were offered to sale for East-Indian bezoar. This tree has a thick root of a softer substance than usual. Trunk of a middling size, from twelve to twenty feet in height, smooth, with an ash-coloured bark; branches rather erect. The root when young is scraped, and used by the inhabitants as horse-radish in Europe, being much the same under the name of artichoke; as have also the seeds. It is a native of the East Indies; and is cultivated in Jamaica and Egypt.

3. Guilandina Nuga, or nuga guilandina; stem unarmed; the primary petiole of the leaves with double prickles underneath. Native of Amboyna, and Moluccas, in swamps by the sides of rivers.

4. Guilandina Morina, or smooth bondouc: unarmed; flowers flat, ovate, oblong, on a peduncle; this tree has a thick root of a softer substance than usual. Trunk of a middling size, from twelve to twenty feet in height, smooth, with an ash-coloured bark; branches rather erect. The root when young is scraped, and used by the inhabitants as horse-radish in Europe, being much the same shape and size; as have also the seeds. It is a native of the East Indies; and is cultivated in Jamaica and Egypt.

5. Guilandina dioica, hardy bondouc, or Canada nicker-tree: unarmed; leaves bipinnate, at the base and tip simply pinnate. A leaf of this is shown on the Botany Plate VI. fig. 4. Stem erect, thirty feet high or more, divided into many branches, covered with a very smooth bluish ash-coloured bark. Leaflets oval, very smooth and entire, alternate. There are male and female flowers on different plants. Native of different places, whence it was first brought to Paris.

6. Guilandina gemina, or twin-fruit bondouc: prickly; one-leaved, fruit in pairs. Stem shaggy, large, suffruticose, with many climbing branches, on which are many recurved scattered prickles. Seeds two or three, roundish, shining, ash-coloured, very hard, containing a roundish oily kernel like an almond. Native of Cochin-China.

Propagation and Culture. The four first species, being natives of warm countries, will not live through the winter in England, unless they are placed in a warm louse, and the pots plunged into the tan-bed. They are propagated by seeds; but those of the two first sorts are hard, to which they are soaked two or three days in water before they are put into the ground, or placed under the pots in the tan-bed to soften their covers, they will remain years in the ground without vegetation; when the plants come up, they will be fit to transplant in a short time; then they should each be transplanted into a small pot, filled with light fresh earth, and plunged into a moderate hot-bed of tanners' bark, shading them till they have taken fresh root; then they must be treated much as other tender exotic plants, giving them a large share of air in warm weather, and but little water; and when the plants have advanced to be too tall to remain in the frames, they must be removed into the bark-bed and plunged into the hot-bed, where they will make great progress, and if they have not too much water, especially during the winter season, for these plants are very impatient of moisture in cold weather. The fifth species will live abroad, and is never hurt by frost. It is propagated by cutting off some of the horizontal roots, or by suckers. It requires a light soil, not too moil.

GUILANDINUS, f. in botany. See GUILARDONDES.

GUILANDINUS (Melchior), an eminent botanist, born at Konigiberg in Prussia. He studied medicine in his youth, and at an early age left his country and went to Rome. After a residence there of some years, he visited Sicily, where he was reduced to such indigence, that he sold his beads for money to clothe his children. The Venetian ambassador at Rome, acquainted with his merit, took him from this situation, and carried him to Venice. He there became known to the cavalier Marino Caballo, who lent him to travel for botanical purposes into the East. He visited Palestine, Egypt, Africa, and Greece, and on his return prolonged his travels in the East, and had the misfortune of being taken by the Barberian corsair near the coast of Sardinia, and carried into captivity.
capitvity. Even in this situation his ardour for botany did not flublde, for he still continued to increase his catalogue of plants. The celebrated Fallopis, then di-
rector of the botanical garden at Padua, paid his rani-
som, and procured him the lectureship of botany at that 
university in 1561. He gave so much satisfaction in this poft, that his salary was raised to fix hundred flor-
s. He died at Padua in 1589, and out of gratitude bequeathed his library to the Venetian flate. His 
works are 4. De Spermonibus. Epiphanius, 1558, 400. 2.
Malleolom. 3. De Papiro. i.e. Commentarius in 
tria Papyri de Papyro Capite, 1543, 400. This is a performance of great erudition, hitorical, critical, and medical, in which the author is so immerfed, that he gives no description of the papyrus itself, though he knew it growing in Egypt. After his death his Synonyma Plan-
terum was published by Schenckius, at Frankfurt, 1608: it is a dictionary, in which the Greek names of plants are conciliated with the Latin, both ancient and modern.

GUILDR, [goldr, Sax., a fellowship, a corporation.] A society ; a corporation; a fraternity or company, combined together by orders and laws made amongst themselves by their prince’s licence. Hence the common word gild or guildhall proceeds, being a fra-
ternity or commonalty of men gathered into one combi-
nation, supporting their common charge by mutual con-
tribution. Council.—In woollen cloth it appears, by 
those ancient guilds that were settled in England for this manufa-
ture, that this kingdom greatly flourished in that art. Hale.

As when the long-eared milky mothers wait At some sick miler’s triple-bolted gate, For their defrauded absent foals they make A moan so loud, that all the guild awake. Pope.

It was about the clofe of the eleventh century, says Anderfon, in his History of Commerce, vol. i. p. 79, that merchant-gilds, or fraternities, which were afterwards styled corporations, came fift into general ufe in many parts of Europe. Mr. Maddox, in his Firma Burgi, chap. i. thinks they were hardly known to our Saxon progenitors, and that they might be probably brought into England by the Normans; although they do not seem to have been very numerous in thofe days. The French and Normans might probably borrow them from the free cities of Italy, where trade and manufa-
tures were much earlier propagated, and where politically such corporations rul’d in the coffee and alleys of all ranks, who at their admission con-
tributed to the maintenance of the fociety in proportion to their circumftances. Three annual officers governed them; an alderman who prefided, and two treafturers. They had also a body of statutes which on their admif-
sion they were sworn to obferve.

GUILD-MERCHANT, f. A merchant intituled to certain privileges; a privilege by which merchants are authorised to hold pleas of law within their own pre-
cincts. Scott.

GUILD-RENTS, f. Rents payable to the crown by 
your guild or fraternity; or fuch rents as formerly be-
longed to guilds, and which were left under the old 
guilds, and which are allotted out of the general dilfolution of monafteries, being ordered to be held by the flat. 22 Car. II. c. 6.

GUILDF, [guld, Dut. and Germ.] A Dutch coin, in value about 2s. or 1s. 6d. sterling; that of 
Germany pafies in all or most parts for about 2s. 6d. ex-
cepting the guider of Mifnia, which is about 3s. 10d. The new specie of guider, delightful in appearance, and made from silver by Sir William Aquillon, ditteriff of Surrey andSucfex. Since that time it has gradually sunk into ruins. The roof of the tower fell in April 23, 1700.

Here are fome remains of a palace of great extent, which, as appears by the bell authorities, was the re-
ference of Ethelwald, one of the Saxon kings, upwards of eight hundred years ago. It also appears from the foundations that have been dug up, at fome distance from the place where the ruins fland, that the whole declivity of the hill on the eaf side of the river Wey was occupied by this monarch.

The town is a corporation by prescription, has an 
elegant town-hall and council-chamber, and its privi-
leges have been enlarged by several charters. It con-
fits of a mayor, seven magiftrates, and about twenty bailiffs, by the ille of the Mayor and Approved Men of Guildford, who afemble and hold a court in their guild-
hall every three weeks, and are vested with power to try their general fessions of judging criminals to death. By a grant in 1526, the county-court and afizes for Surrey are to be held here for ever. By another grant of James I. the mayor and recorder and two of the approved men are annually jufices of the peace in and for the faid corporation and liberties of Stoke-above-Bar, and the mayor continues in the commission the year after his mayoralty expires. This town, which was incorporated by Henry I. gives the title of earl to the noble family of North. It fent members to parliament anno 23 Ed-
ward I. The mayor is the returning-officer.

There are three parish-churches here, Trinity, St. Mary, and St. Nicholas; the lat in the patronage of 
the dean of Sarum; the two firft have long been vefted 
in the crown, and were consolidated and augmented in 1658 by the legiffature, aided by private benefactions. The upper (or Trinity) church fettled in May 1740. There was preching in it the Sunday before, and work-
men were employed in taking down the bells and fpeeple; but they had quitted the spot about an hour before the accident happened, fo that not one per-
son received any hurt, though great numbers were spec-
tators, it being their fair-day. Three bells had been 
taken down, and the other three fell with the fpeeple, which broke the body of the church to pieces. It has been once rebuit with brick, and is now a neat and ele-
gant structure.

Here is an ancient and curious building of the Gothic 
order, called the Friary, in one part whereof the judges are accommodated during their flay at the afizes; and the afsemblies and public feafs are usually kept here.

The grammar-school, which is a noble stricture of the Gothic order, was founded and endowed in 1509 by Robert Beckingham, of London, grocer, and has been liberally augmented by the contributions of feve-

cral, before, in, and after, the time of king Edward VI. Gilds of the ifters of this city have been greatly mul-
tiplied since its foundation, and the royal grammar-school, by the name of Schola Regia Gram-
maticalis Edwadii Sexti, and gave thereto twenty pounds 
per annum for ever. After whom William Hammond, efq. and Dr. John Parkhurst bishop of Norwich, were 
very liberal to the fame; and it is at this time in a very flourishing state. At this school have been educ-
ed many very eminent perfon, one of whom was George Z. Abbott,
Abbott, archbishop of Canterbury, who, in 1621, built a magnificent hospital here, and settled thereon three hundred pounds per annum, with a joint donation of six hundred pounds from Sir Nicholas Kemp, knt. for the maintenance of a master, twelve aged men, and eight women, all single persons, and for the encouragement of the woollen-manufactory which then flourished here. To this hospital Mr. Thomas Jackman, late an alderman in this borough, bequeathed six hundred pounds in the year 1753, whereby the number of women was increased to twelve.

The hall wherein the county-alizes had long been held being much decayed, an elegant structure, with suitable offices, was built for that purpose in 1789 at the expense of lords Onslow and Grantley; adjoining to which was also built in the same year a commodious theatre. The town draws much support from travellers, on account of its elegance and public road from London to Chichester, Portsmouth, Southampton, and other capital towns in the south and western parts of England; and is admitted by all, from its fine situation, the elegance of its inns, goodness of provifions, and genteel accommodation in general, to equal any other town in the kingdom. On Drake, or St. Catharine's-hill, are the ruins of a chapel, formerly a chapel of ease to St. Nicholas' church in the town. This chapel was built with a fort of tile, which when broken has the appearance of iron, and the cement is so hard, that it is almost impenetrable.

The river Wey was made navigable to Guildford about the year 1656, under the patronage of Sir Richard Weldon, bart. of Sutton-place in this neighbourhood, who first introduced into England those useful inventions of river-locks, tumbling-bays, and turnpike-roads, which now, and for many years past, have enabled the inhabitants of Guildford and its vicinity to convey their merchandise to and from London thereby, and to supply the surrounding villages on the easiftest terms; as well as to carry on a very considerable trade in corn, malt, beer, &c. This navigation is also of great support to Farnham market, corn bought there being brought to the mills on this river within seven miles distance, and, after being ground and dressed, is sent down in barges to London. Guildford has a good market on Saturdays, and three considerable fairs annually, viz. on May 4, October 2, (which is held on St. Catherine's-hill, before mentioned), and November 22.

GUILDFORD, a township of the American States, in Franklin county, Pennsylvania.

GUILDFORD, a township of the American States, in Windham county, Vermont, on the west bank of Connecticut river. It is oppofite the mouth of Israel river in New Hampshire.

GUILLE, f. [guille, guil, old French, the same with guile,] Decietful cunning; infamous artefact; mischievous folly.—Deep, hollow, treacherous, and full of guile. Shakespeare.

The guileful phantom now forbokin the throwed, And flew sublime, and vanish'd in a cloud. Dryden.

Treacherous; secretly mischievous:
I train'd thy brethren to that guileful hole,
Where the dead corpse of Balianus lay. Shakespeare.

GUILLEFULLY, adv. Wily; infamous; mischievously artful.—The way not to be inveigled by them that are so guileful through skill, is thoroughly to be instructed in that which maketh skilful against guile. Hooker.

The guileful phantom now forbokin the throwed, And flew sublime, and vanish'd in a cloud. Dryden.

GUILLE, n. [See Beguile.] One that betrays into danger by infamous practices:
But he was wary-wise in all his way,
And well perceived his deceitful flight;
Ne suffered luft his safety to betray;
So goodly did beguile the guiler of the prey. Spenser.

A cheat in general.—Where those two guilers with Malbecco were. Spenser.

GUILLEMAUX (James), an eminent French surgeon, born at Orleans. He enjoyed a liberal education, and was in his profession a pupil to the celebrated Ambroise Paré. He became surgeon in ordinary to the kings Charles IX. and Henry IV. and was equally esteemed for his skill and his probity. He died at Paris in 1609. He was the author of several works which have placed him among the fathers of the improved French surgery. He translated into Latin the works of his master Paré, with some additions, published in 1582, folio. His other works are, 1. Traité des Maladies de l'Oeil, 1594, folio; a complete treatise of surgery, with plates and instruments, descriptions of operations, &c. 2. Traité des Maladies de l'Oeil, 1598, 8vo. describing one hundred and thirteen diseases of the eye, chiefly from the ancients. 3. Chirurgie Françoise recueille des anciens Médecins (3 Chirurgiens, 1594, folio; a complete treatise of surgery, with plates and instruments, descriptions of operations, &c. De l'heureux Accouchement des Femmes, 1609, 8vo. the first complete work on difficult parturition, after that of Ruffius. He wrote some smaller pieces, one of which was against the absurd and indecent custom of the congrès. All his works were printed in Paris, in 1616, in folio.

GUILLEMIT, f. in ornithology. See COLUMBUS, vol. iii. p. 838.

GUILLESTRE, a town of France, in the depart
ment of the Higher Alps, and chief place of a canton, in
the district of Embrun; taken by Prince Eugene in
the year 1692: three leagues north-north-west of Em-
bru.

GUILLET de SAINT GEORGE (George), born in 1625 at Thiers in Auvergne, and the first historio-
grapher of the school of Painting and Sculpture, of
which office he was elected in 1682. He died at Paris
in 1705. He made himself respected by several works,
especially by his Athenee Ancien et Novelle, 1675, 12mo.
and Lacedemone Ancien et Novelle, 1676. His Athens
was warmly attacked by Spon, in his Voyage de Grece; and
a controversy ensued, in which Guillet at last displayed
much erudition, with a subtle and critical style of writ-
ing. His other works are, 1. A History of the Grand
Viziers Coproglis, &c. 1676. 2. The Life of Maho-
met II. 1661. 3. The History of Caftro and Carra,
translated from the Italian of Machiavel. 6. Les Arts
d'Honneur d'Epe'e, ou Dictionnaire du Gentilhomme, 2 vols.
1670.

GUILLIAUD (Claude), a learned French divine,
native of Villefrica, in the Beauxjoiis. He pursued
his studies at Paris, where he became a doctor of the
faculty of the Sorbonne, and acquired much reputation
by the lectures which he delivered on the sacred Scrip-
tures. He was also promoted to a canonry and prebend
in the cathedral church of Autun. His age and the
time of his death are equally unknown. He was the
author of, 1. Commentaries on the Gospel of St. Mat-
tthew, 1530, folio. 2. Commentaries on the Gospel of
St. John, 1562, folio. 3. Commentaries on the Epiphi-
es of St. Paul, and on all the canonical epistles, under
the title of, Collationes in Omnes D. Pauli Epiftolas, &c. 1544.
4. Homilies for Lent, 1560. His age and the
GUILIM (John), son of John Guillim, of Well-
bury in Gloucestershire, born in Herefordshire in 1565.
He was first sent to a grammar-school at Oxford, and
entered a student of Brasen-noze college, in 1581.
Having completed his pursuits in literature in the uni-
versity, he came to London, and was made a member
of the society of the college of arms, by the title of
Portsmouth; and afterwards promoted to the honours
of rouge-croix pouruivant of arms in ordinary, in 1617;
in which office he continued till his death, in 1621.
His claim to literary fame arises from his celebrated
work, entitled, The Display of Heraldry, published by
himself in 1610, folio, which has gone through many edi-
tions. To the fifth, which came out in 1679, was added
a Treatise of Honour, civil and military, by captain
John Loggan. The last was published, with very large
additions, in 1724. This appears to have been one of
the earliest general treatises on the science of heraldry
in the English language; and when we consider the
technical language and nice discrimination which must
necessarly be employed in the compilation of heraldic
history, this work, for the time in which it was written,
must, with all its faults, be allowed to profess a con-
derable share of professional merit.

GUILFORD, a town of France, in the department of
the Yonne, and chief place of a canton, in the district of
Avalon; seven miles east of Avalon.

GUILLOTINE, f. [French.] An instrument cal-
culated for the decapitation of criminals, of very an-
cient invention, but called 'into ufe during the late fan-
guinary revolution in France, on the recommendation
of M. Guillotine, who received a reward from the na-
tional assembly for a model of it; and hence it took
his name. It has been said, however, that this inge-
nious physician, falling afterwards under the displeasure
of Robespierre, suffered death by the stroke of his own
instrument. The machine consists of two upright posts,
ten feet high, joined at the top by a horizontal piece
of timber. At four feet from the bottom is a cros-
bar upon which the neck of the criminal is laid, and
over that falls a similar bar, shaped to receive the
neck, like the board of a pillory. On the inner faces
of the frame are grooves, along which the extreme
edges of an axe slide up and down, and which, in fall-
ing, with a heavy mafs of lead fixed to its upper part,
fevers the culprit's head from his body by a sliding cut.
The upright fide of the axe is wholly included in the
frame which guides it, by means of a cord and pulley.
The criminal is tied to a board, so as to lay the body
horizontally with the face downwards, and with the head
advanced over a basket placed for its reception.

The firing being loofened by the executioner, the axe
defends, and the head is severed in an instant. This
machine, during the tyranny of Robespierre, was called
the national razor. The possibility of execution by its
means is wonderful. Samfon, the guillotinist of Paris;
worked it with such rapidity, that, including the pre-
parations of the punishment, he was known to cut off
forty-five heads, the one after the other, in the short
space of fifteen minutes; so that it required no more
than twenty-three minutes and twenty seconds, to de-
capitate seventy persons!—For an idea of the figure or
contraftruction of the guillotine, see the entablature at
the foot of the portrait of the unfortunate Louis XVI,

A similar machine once existed in England, but was
confined in its ufe to the province of Hardwick, or the
places within its precinct. The execution was gene-
 rally at Halifax. This machine has a larger handle,
but one of the fame kind is in a room under the parlia-
ment-house at Edinburgh, where the ufe of it was
introduced by the earl of Morton, who took a model of
it as he passed through Halifax; and he, wonderful to
relate, had the misfortune to suffer by it himself. In
England and Scotland it was called a MAIDEN; which
fee.—A similar instrument was used by the Romans un-
der the name of tympanum. Euphorion, of Chalcis,
quoted by Athenaeus, p. 154, tells us, that to be tympa-
nized was to have the head cut off by an axe. Ac-
cording to Photius, the tympanum was a machine of
wood, with which the criminal was struck and decol-
olated.

GUILT, / [Guilt, Sax. originally signifies the fine
or mulct paid for an offence, and afterwards the offen-
s itself.] The state of a man guilty charged with a crime;
the contrary to innocence. —It was neither guilt
of crime, nor reason of flate, that could quench the envy
that was upon the king. Bacon. —When these are
thrown away, the possibility of guilt, and the possibility
of innocence, what restraint can lie upon man. Ham-
mond.—A crime; an offence:

Clove pent-up guilt.
Rive your concealing continents, and ask
These dreadful funnompers grace.

Wiltily, adv. Without innocence; without
clearness of conscience.

Bodily and guilty; guiltily awake,
And in a bloody battle end thy days.

Guiltiness, f. The state of being guilty; wick-
edness; conscious of crime.—He thought his Right
rather to proceed of a fearful
ednefs; confcionfnefs of crime.—He thought his Right
of guilt, the contrary to innocence.—It was neither

of whose guiltless sins I was better affuited than any man living could be. King Charles.

GUILTY, adj. [xultrix, Sax. one condemned to pay a fine for an offence.] Justly chargeable with a crime; not exempt. We are very guilty concerning one another, in that we faw the anguish of his soul when he befought us, and we would not hear. Gen. xliii. 21. — Wicked; corrupt:

All the tumults of a guilty world,
Toft by ungenerous passion, sinks away. — Thomson.

GUILTY-LIKE, a.d. Guiltily:

Callo, my lord! No, sure, I cannot think it,
That he would deal away so guilty-like,
Seeing you coming. — Shakespeare.

GUIMARÃES, a town of Portugal, in the province of Entre Duero e Minho, divided into Old and New Town, the former situated on an eminence, about 1500 paces in circumference, surrounded with walls, low, weak, and defended only by a single barbican, Thomjon.

Toll by ungenerous passion, sinks away, living could be. — King Charles.

New Town, the former situated on an eminence, about fifty-seven streets, eight gates, four bridges, and six convents. The collegiate church of Notre Dame de oliveira is said to be founded on the ruins of a temple of Ceres. Guimarães contains fifteen squares, fifty-seven streets, eight gates, four bridges, and six thousand inhabitants. Here is a manufacture of linen, in high estimation. Ten miles south-east of Braga, and twenty-seven north-north-east of Oporto. Lat. 41° 25'.

GUIMARÃES, or IMARAS, one of the Philippine islands, about ten leagues in circumference, covered with trees, and producing a great quantity of farfapa—

GUIMÃBALA, a Kingdom of Africa, situated to the south of Tombuctoo, near a large lake, from which the Niger is said to take its rise.

GUINEA, a very extensive and fertile country, lying on the western side of the continent of Africa, washed by the Atlantic Ocean, extending along the coast about four thousand miles, beginning at the river Senegal, in the seventeenth degree of north latitude, being the nearest part of Guinea as well to Europe as to North America. From that river to the river Gambia, and in a fartherly course to Cape Sierra Leon, is comprehended a coast of about seven hundred miles; and is the same tract for which Queen Elizabeth granted charter to the first English traders to that coast. From Sierra Leon, the land of Guinea takes a turn to the eastward, extending that course about one thousand five hundred miles, including those several technical divisions known by the names of the Grain coast, the Ivory coast, the Gold coast, and the Slave coast, with the country or kingdoms of Benin; these coasts and countries form the district now called Upper Guinea. From hence the land runs southward along the coast about one thousand two hundred miles, which contains the kingdoms of Congo and Angola; where the traffic for slaves ends; and this extent of country forms the district of Lower Guinea. The country, and between the two above-mentioned rivers, is chiefly subject to three great negro nations, known by the name of Jaloffis, Foulahs, and Mandingos. The Jaloffis possess the middle country. The Foulahs inhabit both sides of the Senegal; great numbers of these people are also mixed with the Mandingos, who are settled on both sides the Gambia, but principally in the interior country. See the articles Foulahs, Jaloffs, and Mandingos.

The earliest account we have of Guinea, particularly that part situated on and between the two great rivers of Senegal and Gambia, is from the writings of two ancient authors, one an Arabian, and the other a Moor. The first wrote in Arabic about the twelfth century. His works, printed in that language at Rome, were afterwards translated into French at Paris under the patronage of the famous Thuanus chancellor of France, with the title of Geographia Nubjens, containing an account of all the nations lying on the rivers Senegal and Gambia. The other was written by John Leo, a Moor, born at Granada in Spain, before the Moors were totally expelled from that kingdom. He refided in Africa; but, being on a voyage from Tripoli to Tunis, was taken by some Italian corsairs, who, finding himposses of several Arabian books, besides his own manuscripts, apprehended him to be a man of learning, and as such preferred him to pope Leo X.

This pope encouraging him, he embraced the Romish religion; and his description of Africa was published in Italian. From these writings we gather, that after the Mahometan religion had extended to the kingdom of Morocco, some of the promoters of it crossed the sandy deserts of Numidia, which separate that country from Guinea, found it inhabited by men, who, though under no regular government, and deftute of that knowledge the Arabians were possessed of, kept a kingdom in content and peace. The first author particularly remarks, that they never made war, or travelled abroad, but employed themselves in tending their herds, or labouring in the ground. J. Leo says, p. 65, "That they lived in common, having no property in land, nor transported goods. But for this, they were in an equal state, upon the natural produce of the country, which afforded plenty of roots, game, and honey. That ambition or avarice never drove them into foreign countries to subdue their neighbours. Thus they lived without warfare or superfluities." The ancient inhabitants of Morocco, who wore coats of mail, and used swords and spears headed with iron, coming amongst these Moors, taught the negroes the Mahometan religion, and many of the arts of life; particularly the use of iron, before unknown to them. About the fourteenth century, a native negro, called Heli Iphchia, expelled the Moorish conquerors; but though the negroes threw off the yoke of a foreign nation, they only changed a Libyan for a negro master, Heli Iphchia himself becoming king, led the negroes into foreign wars, and established himself in power over a very extensive country. Since Leo's time, the Europeans have had very little knowledge of those parts of Africa; nor do they know what became of this great empire. It is highly probable that it broke into pieces, and that the natives again resumed many of their ancient customs; for in the account published by Moore, in his Travels on the river Gambia, we find a mixture of the Moorish and Mahometan customs, joined with the original simplicity of the negroes. Such are the accounts we have of that luxuriant but wretched country, which gave birth to the traffic for human beings, just the same as for beasts, in that market. This disgraceful trade was first commenced by the Spaniards in 1517, under a patent granted by the emperor Charles V. at the instance of Las Cafas, the noted advocate for the American Indians. In England, it was first let on foot by sir John Hawkins, under the auspices of queen Elizabeth.

That part of the African coast on the Atlantic Ocean, with which the people of Europe have had the most intercourse, extends from Cape Blanco, in 21° N. lat. to a Portuguese settlement called Loango St. Paul's, in the kingdom of Angola, lat. 5° S. comprehending a line
The negroes obtained through their means, as of Benin, Bonny, Old and New Callabar, Cameroon, leagues. The maritime country is divided into a number of petty dates or principalities, seemingly independent of, and often at war with, each other; the chief of which are Axim, Ante, Adorn, Jabi, Commani, Mandingoes; but improperly; as many different languages are spoken on the coast between Senegal and Apollonia. This part of Africa is commonly called the Windward Coast.

The Gold Coast extends from Cape Apollonia to the river Volta, comprehending a line of one hundred leagues. The maritime country is divided into a number of petty states or principalities, seemingly independent of, and often at war with, each other; the chief of which are Abo, Ashanti, Jabi, Fantin, Acon, and Agonna; some of which are said to maintain a republican, or more probably an aristocratical, form of government. In the British West Indies, most of the negroes which have been purchased on this coast, are known to the West-Indian planters by the general name of Mandingoes. From Cape Palmas to Cape Apollonia, the European settlements, except the English factory in the river Sierra Leone, are chiefly those of the Portuguese. The negroes obtained through their means, as well as from the English factory, are likewise called Mandingoes; but improperly; as many different languages are spoken on the coast between Senegal and Apollonia. This part of Africa is commonly called the Windward Coast.

From the river Volta to the river Lagos, extends the Whidah country, by some geographers considered as part of the Gold Coast; by others denominated the Slave Coast, or Guinea Proper. It begins with the small and barren state of Koto or Lampi, next to which is the kingdom of Adra, comprehending the subordinate mansions or dominions of Great and Little Popo, or Popo; from which the Whidah negroes are called generally, by the British traders, Papaw. The Whidah language, except as to the inhabitants of Koto, is peculiar and appropriate. The people of Koto speak a dialect of the Gold Coast, and there is a tribe of Whidah negroes called Agas, who have a dialect which, though understood by the Papaws, differs from the Whidah language in many particulars.

Weft of the river Lagos begins the great kingdom of Benin, the coast of which forms a gulf or bay, extending at Cape Lopez, wherein are situated the trading places of Benin, Bonny, Old and New Calabar, Cameron, and Gaboon. This coast is thirty leagues long, on this part of the coast, have the general denomination of Eboes, probably from Arebo, the name of a village, formerly a considerable town, on the river Benin. Some of them, (a tribe from the interior country,) are likewise called Mocoes. In language they differ both from the Gold-Cost negroes and those of Whidah, and in many respects from those of Lagos and Bonny. The coast of Angola, the dialects vary at almost every trading river.

From Cape Lopez to the river Congo, distant one hundred and forty leagues, the trade has been chiefly engrossed by the Dutch and the French. To the southward of this river, very little trade is carried on by any Europeans except the Portuguese, who have a large city at Louango St. Paul's, on the coast of Angola, strongly fortified; from which place they have penetrated quite through the country to their settlements at, and south of, Moambique, upon the eastern coast of Africa, where they have caravans constantly going and returning, and by that means carry on an extensive and lucrative commerce.

The whole number of forts and factories established on the coast of Africa by the different powers of Europe, is forty; of which fourteen belong to the English, three to the French, fifteen to the Dutch, four to the Portuguese, and four to the Danes. The commodities exported by the British traders to Africa, chiefly of woolens, linens, Manchexer goods, Birmingham and Sheffield goods, East-Indian silks and goods; ready-made clothes; muskets, bayonets, cutlasses, gunpowder, shot; wrought and unwrought brass and copper, lead, pewter, wrought and unwrought iron, hats, wrought caps, earthen war, British spirits, rum and brandy, tea, sugar, coffee, and provisions of every kind. The annual value has, of late years, been estimated on an average of about $500,000 sterling.

The above commodities, to this great annual amount, were bartered, not for gold and ivory, which for a long time was the pretence; but for human flesh, or those wretched beings in the shape of man, called Slaves. Of the numbers purchased on the English account, we have the following statement given by Mr. Blundell, towards, in his History of the West Indies, vol. ii. p. 55. "About 140,000 negroes were imported by the African company, and 160,000 more by private adventurers, between the years 1680 and 1700; total 300,000. From the year 1700 to December 1786, the number imported into Jamaica was 610,000. Of the number imported during the same interval into the southern provinces of North America, as well as the Windward Islands, I cannot speak with precision; but I am of opinion that the Jamaican import may fairly be reckoned one-third of the whole. On these grounds, the total import into all the British colonies of America and the West Indies, from 1680 to 1786, may be put at $1,730,000, being, on an average of the whole, $19,295 annually."

Of the whole number of slaves annually imported from the coast of Guinea juf before the abolition, by the subjects of Great Britain, France, Holland, Denmark, and Portugal, and the particular countries whence supplied, the following account was transmitted by the merchants of Liverpool to the lords of the privy council; and it is undoubtedly the most authentic and particular a return as can possibly be obtained: viz.

A a
Of the miserable people thus condemned to perpetual exile and servitude, though born in various and widely-separat ed countries, it is not easy to discriminate the peculiar manners and native propensities. The familiar and uniform system of life to which they are all reduced; the few opportunities and the little encouragement given them to mental improvement, are circumstances that necessarily induce a predominant and prevailing cast of character and disposition. “The day (says Homer) which makes man a slave, takes away half his worth;” and, in fact, he loses every impulse to action, except that of fear. But, thanks to the genuine benevolence of Mr. Wilberforce, aided by the superior benevolence of a British house of commons, this inhuman traffic, as far as relates to the commerce of Great Britain, was totally abolished, on the 1st of May, 1807. See the articles Negro and Slavery.

The easiest access to the interior of Guinea, appears to be by means of the two great rivers, the Gambia, and the Senegal; the shores of which are covered with the finest corn, and manifolds, for savages, a very fair state of cultivation, which is chiefly the province or labour of the women. The whole region lying under the torrid zone is filled with reptiles the most noxious and destructive; and with wild beasts of the defert, whose howlings are terrible by night, and depredations of extreme perilous by day; yet the negroes and poorer inhabitants go for meat armed only with the ax, spear, or with bows and arrows. See the article Africa, vol. i. p. 187, and the correspondent engraving.

The vegetable productions of Guinea are found in the highest perfection, and in great abundance; but we yet want a scientific catalogue of indigenous plants, to ascertain what are the peculiar and characteristic features of its flora. The low districts of the river Gambia, as far as the tide reaches, are bordered with mangroves and bamboos: the luxuriant Guinana-grafs, the fugar-cane, ginger, turmeric, and cocoa-nut, with various other species of palms, root themselves in the moist deep soils. Numerous kinds of dying-woods, and of timber fit for ornamental or useful purposes, abound in the forests. Indigo and cotton of a superior quality are met with, both wild and cultivated. The sweet callava, differing from the American manioc in being perfectly innoxious and wholesome even without cooking, the Guinea pepper or carpeicum, the yam, sweet potatoe, rice, maize, gourds and melons of all kinds, are the indispensable food of the inhabitants, and probably are indigenous. The capand, inefior, and minofa Senegal, from which exudes the mucilaginous gum of the same name, are plentiful in the drier and sandy parts of the country.

GUINEA (New), an island of the Eastern Indian Ocean, or of the North Pacific Ocean, situated to the northward of New Holland, from which it is separated by Endeavour Straits. The length of this island, from north-east to south-west, is about five degrees; from west to east, is about thirty-five miles. The interior of this island is found to be void of all habitations, and the coast is not navigable. The soil is sandy, and the climate neither to be compared with that of the islands in the Indian Ocean, which are found in the same latitude.

GUINEA, /. [from Guinea, a country in Africa, described above.] A gold coin valued at one and twenty shillings:

Ladies, whose love is constant as the wind;
Cits, who prefer a guinea to mankind.

Young.

The value or rate of the guinea has varied. It was at first equal to twenty shillings; but by the scarcity of gold it was afterwards advanced to 21s. 6d., though it is now sunk to 21s. The pound weight troy of gold is cut into forty-four parts and a half, and each part makes a guinea, which is therefore equal to 8s. 4d. or 52 oz. or 5 shillings.

GUINEA-HEN, /. A bird supposed to be originally from Guinea. For its natural history, &c. See Numer.ère. Mr. G. I would say, I would drown myself for the love of a Guinea-hen, I would change my self for the love of a Guinea. The pintado. For its natural history, see Cavia, vol. iii. p. 927.

GUINEA-PEPPER, /. in botany. See Capsicum.

GUINEA-PIG, /. A small animal with a pig’s snout. See the article tame, vol. iii. p. 927.

GUINEA-WHEAT, /. in botany. See Zea.

GUINEA-WORM, f. in zoology. See Dracunculus, the long kind of earth-worm.

GUINES, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the district of Calais: two leagues south of Calais, and one and a half west of Ardes.

GUINET, a township of the American States, in Montgomery county, Pennsylvania.

GUNINGAMP, a town of France, and principal place of a district, in the department of the North Coasts: three posts and a half west of St. Brieuc, and sixty and a quarter west of Paris. Lat. 48° 33'. Lon. 14° 14'. 32 E. Ferro.

GUIOLLE (La), a town of France, in the department of Maine-et-Loire, and chief place of a canton, in the district of St. Genies-de-Rivedolt; six leagues north-north-east of Nantes.

GUIOMERE, a kingdom or country of Africa, on the Ivory Coast. It is of but small extent towards the coast, but considerable in land. It is populous, rich, and celebrated for its commerce in gold, ivory, and slaves.

GUION. See GUYON.

GUIPAS, a town of France, in the department of the Finisterre, and chief place of a canton, in the district of Brest: one league and a half north-east of Brest, and two leagues of Landernan.

GUIPARY, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of Redon; four leagues and a half north-east of Redon, and two leagues of Béarn.

GUIPUSCOA, a province of Spain, bounded on the north by the Atlantic, on the east by France, on the south-east by Navarre, on the south by Alava, and on the west by Biscay; twenty-five miles in length from north to south, and from fifteen to twenty in breadth from east to west. The country is mountainous and woody.
woody, and it is supposed that formerly the whole country was covered with wood; among the trees are chestnuts, oaks, walnuts, filberts, and an astonishing quantity of apple-trees for cider, and other fruit-trees; but these forests begin to be thinned, from the multitude of forges which have been established to manufacture the iron found in the mountains, supposed to be the best in Europe. The places where the iron is free well cultivated, and the inhabitants pay more regard to the culture of trees than in any other province in Spain. The chief towns are Tolosa, St. Sebastian, and Fontarabia.

GUIS'A, a town of the island of Cuba: thirty-five miles north of Trinidad.

GUIS'CHARD, a kind of halbert. Philips, Obsolete.

GUYS'ARM, a town of France, in the department of the Oise, and chief place of a canton, in the district of Noyon: five miles north of Noyon.

GUYS'CHARD (Charles Gottlieb), called Quintus Ithius, knight of the order of Merit, and member of the academy of sciences at Berlin, born in 1744 at Magdeburg, where his father was syndic. He studied at the universities of Halle, Marburg, Herborn, and Leyden, where he applied to theology, classical literature, and the oriental languages. By the interest of the hereditary fieldholder, William Charles Henry Frilo, who esteemed him on account of his learning, he was appointed ensign in the regiment of Saxe-Hildburghausen, in the province of the United Princes, and in 1751 promoted to a company. Encouraged by the approbation of the fieldholder, he began to prepare materials for his Memoires Mihitaires sur les Grecs et les Romains; and in consequence of this undertaking obtained permission, in 1759, to visit England, where he brought the work to a conclusion. In the mean time the fieldholder died, and with a view of obtaining the favour of his successor William V. he dedicated to him his Memoirs, which were published in two volumes, quarto. They were received with so much approbation, that they went through five editions in Holland and France. In 1757 he entered as a volunteer in the allied army, and acquired the good graces of prince Ferdinand of Brunswick, by whom he was recommended to Frederick II. of Prussia. About the end of the above year his majesty sent for him to Silefia, kept him near his person, and often conversed with him on the art of war as practised by the ancient Greeks and Romans. The great knowledge which Guischard displayed in regard to this subject, served as the idea of considering him as a Roman officer; and he gave him the name of Quintus Ithius, the commander of Caesar's tenth legion, when he appointed him to the command of a regiment formed out of the refuse of all nations, during the heat of the war. Guiscrich was present in the campaigns of 1759 and 1760, and performed his duty so much to the satisfaction of Frederick, that he gave him a free regiment of three battalions at Leipsic, and at the same time permission to raise seven more free battalions, which he did in an effectual manner, though attended with considerable difficulty. During the campaigns of 1761 and 1762, he served in the army of prince Henry, and continued till the end of the war to discharge, and with great danger, the arduous tasks assigned to him. He died on the 13th of May, 1775, in the fifty-fifth year of his age. After his death his library was purchased by Frederick the Great, for the sum of twelve thousand dollars. His works are, 1. Memoires Miltaires sur les Grecs et les Romains, pour servir de Suite & d'Exécutivement à l'Histoire de Poilhe, 1759; 4 vols. 8vo. 2. Memoires Critiques & Historiques sur plusieurs Points d'Antiquités Miltaires, Berlin, 1773, 4 vols. 8vo, and one quarto volume of plates. Buschting, in his Wochentlichen Nachrichten for the year 1774. Speaking of this work, says, "It will be of the greatest service, not only to officers, but to men of letters. It ought to be used in all schools, in order to give young pupils a clearer idea of whatever occurs in the ancient authors, and particularly in Caesar's Commentaries, respecting the art of war among the Romans."}

Guise, f. [the same with guife; guife, Fr. papa, Sax. the p or w being changed, as is common, into g.] Manner; mien; habit; countenance of behaviour: Thus women know, and thus they use the guife, T' enchant the valiant and beguile the wife. Fairfax.

Practice; custom; property: I have drunk wine past my usual guise; Strong wine commands the fool, and moves the wise.

External appearance; drefs.—The Hugonots were engaged in a civil war, by the specious pretences of some, who, under the guise of religion, sacrificed so many thousands to their own ambition. Swift.

Guise, a town of France, and seat of a tribunal, in the department of the Aisne, on the Oise. It was besieged by the Spaniards, without success, in 1650. Twenty miles north of Laon, and fourteen east of St. Quentin.

Guise (Francis de Lorraine, duke of), eldest son of Claude de Lorraine, duke of Guise, born at the castle of Bar, in 1519, and early distinguished himself in arms. He acquired great glory by his defence of Metz, in 1553, against the emperor Charles V. By his valor and prudence Charles was obliged to retreat after a siege of sixty-five days; and the duke treated with great humanity some of his soldiers, disarmed by the cold. He was afterwards declared by Henry II. lieutenant-general of the kingdom, and entrusted with all the authority of the crown. He justified this confidence by the important capture of Calais in the winter of 1558, which frontier town had from the time of Edward III. been in the hands of the English, and had often served as an entrance into France in the wars between the two countries. At the accession of Francis II. whole wife, Mary queen of Scots, was niece to the Guises, the duke, and his brother the cardinal, were placed at the head of the government. The Calvinists were at this time headed by the prince of Condé and the Colignis, and, being exasperated by many feversities, engaged in the conspiracy of Amboise. Its defeat was chiefly owing to the vigilance and wise measures of the duke of Guise, who was declared lieutenant-general of the kingdom. The duke was a principal leader on the catholic side, as well as the principal object of the hatred of the protestants. It is related by some writers, that at the siege of Rouen he was informed of the purpose of a fanatic of that party to assassinate him. He caused the man to be arrested, and asked him what offence he had given him to excite such an attempt, "No other (he replied,) than that of your being the inveterate enemy of my religion." "Well, (said the duke,) if thy religion bids thee murder me, mine bids me forgive thee:—judge between them!" A noble sentiment, though perhaps but little suited either to the speaker or to his religion! The victory of Dreux, in 1562, is principally ascribed to Guise, though Montmorenci was the chief commander. The calvinist general, the prince of Condé, was taken prisoner; and, according to the manners of the age, he that night shared the bed of the duke of Guise. It is mentioned as a trait of heroism in the character of the latter, that, though they were mortal enemies, he slept with perfect tranquillity, while the prince, who told the anecdote, could not close his eyes. Not long after before Orleans, a Calvinist gentleman, Poltrut de Méré, gave him a mortal wound with a pistole-shot. He died February 24, 1563, at the age of forty-four. By his wife Anne of Ete, daughter to the duke of Ferrara, he left several children. Francis duke of Guise was poetised of many splendid qualities, and the writers of his party represent him as a model of true heroism. For the historical transactions and warfare with
with which the Dukes of Guise were connected, fee the article FRANCE, in our seventh volume.

GUIGNE (William), a learned English divine, born at Aldbros-court, near Gloucester, in 1653. When sixteen years of age he was entered a commoner of Oriel college, in Oxford, when he afterwards removed to All-Souls college, of which he was chosen fellow. So considerable was his proficiency in the different branches of learning, that he acquired the reputation of being a first-rate scholar, and particularly conversant in oriental literature. But he had scarcely begun to apply his stores of knowledge to the public service, before he was prematurely cut off by the smallpox in 1683, when only in the thirty-first year of his age, to the deep regret of all who knew him, and the great loss of the republic of letters. After his death Dr. Bernard, Savilian professor of astronomy at Oxford, published from his manuscripts, Methodus Parvi; Ordinis primi Zeuaini Timii Seftem. Leuint tertit & Commentarii illustravint Guilhelmus Guifus, 1690, 4to. Prefixed to this translation and commentary, is Dr. Edward Pocock's Latin version of Mofes Maimonides's Præfotio in Serio Serain. The conductors of the Alia Eruditorum, in the account which they gave of this work, pronounced the author to be "a man of profound learning, and an immortal ornament to the University of Oxford." At the time of his death, he was engaged in preparing for the press an edition of Abuluted's Geography.

GUISHDEN, a river of Ireland, which rises in the county of Mayo, and runs into the Moyle in the county of Galway.

GUISO, a town of the island of Corfu: sixteen miles south of Corfu.

GUISOPO! a town of Spain, in the province of Catalonia: eight miles north of Cervera.

Guitar. f. [guitara, Ital. guitarre, Fr.] A stringed instrument of music, first used in Spain and Italy: Sallads and eggs, and lighter fare, Tune the Italian farer's guitar. Prior.

GUITONE D'AREZZO (Fra), an Italian poet, and citizen of the place whence he takes his name. Little is known of his life, further than that he was a brother of the military order of the Virgin Mary, otherwise called Guadentia, and that he possessed so much of the purity of the times, as to be founder of the monastery of Degli Angioli of the Camaldolese order in Florence. He died in 1294. He is said to have been the first who gave regularity to the Italian sonnet, and his poems were in great esteem, till the works of Dante and other more cultivated writers leaved their reputation. They are to be met with in several collections of Italian poetry. Forty of his letters were published by Borti, at Rome, in 1745, with many illustrations; they are the oldest written in the Italian language.

GUJURAT, a town of Hindostan, in the country of Lahore: fifty miles north of Lahore. Lat. 31. 50. N. Lon. 72. 56. E. Greenwich.

Gula. f. [Latin.] In anatomy, the orophagus or gullet; that conduit by which animals take down food into the stomac. See Anatomy.

Gula, Guluel, or Gola, f. in architecture, a wavy member, whose contour resembles the letter S, commonly called an ogee.

Gulbe, f. [from gula, Lat.] A glutton: Thou muddy gulch, dar't look me in the face, While mine eyes sparkle with revengeful fire. Brewer.

Gulch, f. [dimin. of gula.] A little glutton. Gulde, a river of Denmark, which runs into the Skagerrack, from the north-east, and meets the Indig, in the north-east, and meets the Indig, in the county of Scania, forty-five miles south by north-east of Randers.

Guldenserad (John Anthony), professor of natural history, and member of the imperial academy of sciences, at Petersburg, born at Riga, in 1745. He received the rudiments of his education in that town, and, having completed his studies at Frankfort on the Oder, was admitted in 1767 to the degree of doctor of physic in that university. On account of his knowledge of foreign languages, and the progres he had made in natural history, he was considered as a fit person to engage in the Kirc Expedition, planned by the imperial academy, at the design of Catherine II. Being invited to Petersburg, he arrived in that city in 1768, was created adjunct of the academy, and in 1770 member of that society, and professor of natural history. In June, 1768, he commenced his travels, and was absent seven years. From Moscow, where he continued till March 1776, he passed to Tver, Tarnouw, Alkän, and Kiljar, a fortress on the western shore of the Caspian Sea, and close to the confines of Persia. In 1779, he examined the districts watered by the rivers Terek, Sunha, and Alkafi, in the eastern extremity of Caucasus; and, in the course of the following year, penetrated into Olfettia, in the highest part of the same mountain, where he collected vocabularies of the language, made enquiries into the histories of the different tribes, and discovered among them some traces of Christianity. Having then visited Cabarda, and the northern chain of the Caucasus, he proceeded to Georgia, and was admitted to an audience of prince Heraclius, who was encamped ten miles from Teflis. Guldenseder was accompanied by Serow, who followed him along the banks of the river Koor, eighty miles into the interior of Georgia, and returned with him to Teflis. At this place he remained all the winter, employed in examining the adjacent country. In the spring he followed the prince to the province of Kazkettia, and explored the southern districts inhabited by the Turcoman Tatars. In July he went in a northerly direction, to a country which lies between the Caspian and the Black Seas, and is bounded on the east by Georgia, on the north by Oiffettia, on the west by Mingrelia, and on the south by the Turkish territories, which was under the dominion of the prince or czar Solomon. In the autumn unknown country of this prince, who in gratitude to Russia for having reinstalled him on the throne, after he had been driven from it, afforded Guldenseder every assistance in his power, this learned traveller penetrated into the middle chain of the Caucasus, visited the confines of Mingrelia, Middle Georgie, and Eastern and Lower Imeretia; and, after escaping many imminent dangers, he ascended to the mountain, where he collected vocabularies of the dialects, and returned to Kiljar, on the 18th of November, where he passed the winter, collecting various information concerning the neighboring Tartar tribes of the Caucasus. In the summer he made a tour to Cabarda Major, continued his course to Mount Befhtan, the highest point of the first ridge of the Caucasus, infected the mines of Madhat, and advanced as far as Tcherkalk on the Don, making excursions thence to Azof and Taganroc, and then along the new limits to the Dnieper. This year's route he finished at Kremenuth in the government of New Russia, and in the ensuing spring was proceeding to Cm Tartary; but, receiving an order of recall, he returned through the Ukraine to Moscou and Peterburg, where he arrived in March 1775. On his return he was employed in arranging his papers; but before he could prepare them for the press, was seized with a violent fever, which carried him to the grave, in the month of March, 1775.

Guldendstein, a town of South Russia, in the island of Funen; three miles south-east of Bogenfred.

Guldendenstein, a town of Germany, in the duchy of Holstein; twenty miles south-west of Oldenburg.

Gule of August, [Gula Augusti, Lat. Geue d'Aout, Fr.] In the Komish church, the day of St. Peter ad Vincula, which is celebrated on the 21st of August, and called the Gule of Augusti, from the name of the Virgin Mary; for this reason, (as pretended) that Quirinus, a tribune, having a daughter who had a disease in her throat, went to pope...
pope Alexander, (the sixth from St. Peter,) and declared of him to the chains that St. Peter was chained with under Necho; which request being granted, the killing of the chains, was cured of her disease; whereupon the pope instituted this festival in honour of St. Peter; and as, before this day was termed only the calends of August, it was on this occasion called indifferently either the Day of the Chains, or the Day of the Gullet, from that part of the body wherein it was wrought. Durandus Rationale Divinarum, lib. 7, c. 19.

GULES, adj. [perhaps from gula, Lat. the throat.] Red; a term of heraldry:

He whose fable arms,
Black as his purpose, did the knight rememble,
When he laid couched in the ominous horse,
Hath now his dread and black complexion smeared
With heraldry more dismal; head to foot.

Gulf, n. [golfo, Ital.] A bay; an opening into land. —The Venetian admiral withdrew himself farther off from the island Curitu, into the gulf of the Adriatic. —An abyss; an unmeasurable depth. —The sea is not the gulf, as is sometimes supposed. —An abyss; an Unmeasurable depth. —The sea beyond the Adriatic, bounding Italy on the east, and Italy and Greece on the north. Its common rapidity is three miles an hour. The width of it is about fifty miles, widening towards the north. Its common rapidity is three miles an hour. The Gulf Stream is supposed to be occasioned by the trade-winds that are constantly driving the water to the westward, which, being compressed in the Gulf of Mexico, finds a passage between Florida and the Bahamas, and runs to the north-east along the American coast. This hypothesis is confirmed by another fact: It is said that the waters in the Gulf of Mexico are colder than those on the western side of the continent in the Pacific Ocean. It is highly probable that the wind carried down by great rivers into bays, and the current out of these bays meeting with the Gulf Stream, by its ebb, have formed Nantucket Shoals, Cape Cod, George’s Bank, the Island of Sables, &c. Skilful navigators, who have acquired a knowledge of the extent to which this stream reaches on the New-England coast, have learnt, in their voyages from Europe to New-England, New-York, or Pennsylvania, to pass the banks of Newfound-land in about 44. 45. N. lat. to live the current in a course between the northern edge of the Gulf Stream, and the shoals and banks of Sable Island, George’s Bank, and Nantucket, by which they take better and quicker voyages to America.

GULLY, adj. [from gulf.] Full of guls or whirlpools; vortexos:

High o’er a gullie fea the Pharian isle
Fronds the deep roar of disemboguing Nile.

To GULL, v. a. [guller, to cheat, old French.] To trick; to cheat; to defraud; to deceive. —If I do not gull him into a new word, and make him a common re-creation, do not think I have wit enough to lie straight in my bed. Shakespeare.

Yet love these forc’ries did remove, and move
Thee to gull thine own mother for my love. Donne.

GULL, n. A sea-bird, for the figure and natural history of which, ice Larus. A cheat; a fraud; a trick. —Either they have these excellencies they are praised for, or they have not; if they have not, ’tis an apparent cheat and gull. Government of the Tongue. —A stupid animal; one easily cheated:

That paltry folly is untrue,
And forg’d to cheat such gulls as you. Holidras.

GULL ISLE, a small island near Cape St. John, in the island of Newfoundland.

GULLCATCHER, n. A cheat; a man of trick; one who catches silly people. —Here comes my noble gullcatcher. Shakespeare.

GULLER, n. A cheat; an imposter.

GULLET, n. [goulet, Fr. gulas, Lat. the throat.] The throat; the passage through which the food passes; the oesophagus. —Many have the gullet which have no lungs or windpipes; as fish, which have gills, whereby the heart is refrigerated. Brown. —A small stream or lake. —The Euxine sea and the Mediterranean, small gullets, if compared with the ocean. Heylyn.

GULLING, adj. A teas term, wearing away by friction, as the pin of a block in the hole of the fayer. Scott.

GULLSPANG, a river of Sweden, which forms a communication between the Skaker and the Wener Lakes.

GULLY, n. Any hollow worn by water: —The violent rain which had fallen in the night had suddenly brought down furious torrents of water through the hollow or gully where they had taken up their station, that they were in the utmost danger of being swept away before it. Hawkesworth’s Travels.

To GULLY, v. n. [corrupted from gurgle.] To run with noise. To wear away by friction; to get loose, as the pin of a block in the hole of the fayer. Scott.

GULLYHOLE, n. The hole where the gutters empty themselves in the superstructure. Brown.

GULOSITY, n. [guloses, Lat.] Greediness; gluttony; voracity. —They are very temperate, seldom feeding in luxury, not erring in gulsy, or superfluity of meats. Brown.

To GULP, v. a. [golpen, Dut.] To swallow eagerly; to suck down without intermission. B. B.
I see the double flaggon charge their hand; 
See them puff off the froth, and gulp again; 
While with dry tongue I lick my lips in vain. Gay.

**GULP, f.** As much as can be swallowed at once.—
In deep respirations we take more large gulps of air to cool our heart, overcharged with love and sorrow. More.

As oft as he can catch a gulp of air, 
And peep above the feas, he names the fair. Dryden.

**GULPE, a river of the duchy of Limburg, which runs into the Geul two miles above Fauquemont.**

**GULPE, a town of the Netherlands, in the duchy of Limburg:** four miles south of Fauquemont.

**GULPH, f.** See Gulp.

**GUM, f.** [Gumma, Lat.] The mucilage of vegetables:
He ripens spices, fruit, and precious gum, 
Which from remote regions hither come. Waller.

Gum is usually transparent, more or less brittle when dry, though sufficiently palatable; of an infipid, or slightly saccharine, taste: soluble in, or capable of combining with, water in all proportions, to which it gives a gluey adherent consistence in proportion as its quantity is greater. These are the leading properties of gums, rightly so called; but the inaccurate custom of former times applied the term gum to all concrete vegetable juices, so that in common we hear of gum-copal, gum-fandarach, and other gums, which are either pure resins, or mixtures of resins with the vegetable mucilage. The only gums are, 1. The common gums, obtained from the plum, the peach, the cherry-tree, &c. 2. Gum Arabic, which flows naturally from the acacia in Syria, Crete, and other eastern parts. It comes to us in small white contorted pieces resembling worms. It is usually dearer than other gums, and forms a thicker jelly with water.—For the chemical analysis of these gums, and for the properties and genera of gum-resins, see the article CHEMISTRY, vol. iv. p. 319, and 320. And for further on ELASTIC GUM, see the article CAOUTCHOUC, vol. iii. p. 744-745.

A very valuable substitute for foreign gums, as employed by calico printers, and in many other branches of manufacture, has lately been discovered by the earl of Dundonald, for which his lordship has obtained, dated July 31, 1809. His lordship states this invention to consist in procuring a substitute for gum-fenagel, or other gums, from the clumps of plants called in botany lichen, from the plants of hemp and flax, likewise from the bark or rind of a willow or lime-tree. The process for obtaining the gum may be varied according to circumstances, and is done by washing the materials in water, digestion, and boilings; and with or without the aid of fixed volatile alkaline salts, or their solutions. His lordship proceeds: "It does not appear, from such trials as I have hitherto made, that there is any very great difference in the produce of gum from the lichen collected from different trees or shrubs; all of them answer equally well for yielding a gum fit for calico printing. The lichen is most abundant on the trees which grow in a poor dirt clay soil, particularly if situated at some considerable height above sea-level. It should be pulled in dry weather, otherwise it is apt to break in the pulling; besides, in this cafe, requiring to be dried before it can with safety be lain up in the hore-houfe, where, if put in dry, it may be kept for years; should a sufficient quantity of it not be found in this country, it may be had in almost unlimited abundance in Sweden, Norway, and in the northern part of America, where it grows to the length of from a foot to eighteen inches, depriving the branches of the tree by its weight. There is, however, every reason to believe, that a sufficient quantity is to be had in this country, according to information from Mr. Brown, lecturer on botany. It takes three or four years in coming to maturity, or its full size, so that a crop from the same tree may be had every fourth year. The lichen does not confift entirely of a gummy matter: there is the outer skin or cuticle, below that a green resinous matter; the remainder of the plant consists of partly gum, partly somewhat analogous to animal fibrous tissues, and a small proportion of fibrous matter, which cannot be dissolved by boiling, or the action of alkaline salts.

"The first process in preparing gum from the lichen is to free it of the outer skin or the plant and the resinous matter. This is done by scalping the lichen two or three times with boiling water, allowing it to stand for a day or two in the water as by absorbing it to swell; in doing this the skin cracks, and comes off along with the greatest part of the resinous matter; or it may be freed from them by gently boiling the lichen for about fifteen or twenty minutes, then washing it in cold water, laying it afterwards on a stone or brick floor, where it should lie for ten or twelve hours, perhaps more. The reason for this is, that the exposure for that time to air greatly facilitates the subsequent extraction of the gum. The scalded lichen is then to be put into a copper boiler, with a due proportion of water, say two wine-gallons to every pound of lichen, and boiled during ten or twelve hours, adding about a quarter of an ounce of soda or pearlash to the lichen, when it swells or burst all its cells about two ounces of volatile alkali. The boiling should be continued until the liquor acquires a considerable degree of gummy consistence. It is then to be taken out of the boiler, allowed to drain or drip through a wire or hair-cloth or hair. The residuum is then to be put into a hair-cloth bag, and to be squeezed in a press similar to that which is used for squeezing lemon. The liquor from the press saturated by a due proportion of water, say two wine-gallons to every hat of alkali, must be boiled or digested with this weak solution for boiling the next batch of lichen. When volatile alkali is used, the boiler should be iron, as volatile alkali acts on copper. Hemp, flax, and the bark of the willow and lime trees, or sea-weed, are to be heated by fire, or the steam of water. Before evaporating the liquor containing the gummy consistence necessary, it should be kept ten or twelve hours, or so as to allow the sediment or dregs to subside. The clean liquor may either be drawn off by a syphon, or the dregs may be drawn off by a cock, at the bottom of the wooden vessel; the bottom of which should be made sloping, higher at the back than the fore part, in order that the dregs may run more completely off. The proportion of gummy matter remaining in the dregs may be got off by mixing them with a due proportion of boiling water, allowing the liquor to clear, and proceeding as above directed, employing this weak solution for boiling the next batch of lichen. When volatile alkali is used, the boiler should be iron, as volatile alkali acts on copper. Hemp, flax, and the bark of the willow and lime trees, or sea-weed, are to be heated in a similar manner, to extract the gum or mucilage contained in them. When gum from the lichen is to be employed for making ink, manufacturing and staining paper, or for making filks, tapes, and paper weights, it should be extracted from the lichen without employing any alkaline salts, continuing the boiling or digestion longer, and with a moderate degree of heat, in which case the gummy extract will be nearly colourless.

This invention bids fair to produce an immense saving to calico printers, as well as to every other species of manufacture.
GUM

manufacture where large quantities of foreign gum have been usually employed.

To GUM, v. t. To close with gum. The eyelids are apt to be gumm'd together with a viscous humour. Wiseman.

GUM-CISTUS, f. A species of rock-trove, of which there are several distinct sorts. Major's Supplement.

GUM-ELASTIC, f. in botany. See Latropha. GUM-BLA'I MI TREE. See Amryis and Burnera.

GUM-LAC. See Croton.

GUM-SUC'CORY. See Chondrilla.

GUMBINNEN, a town of Prussian Lithuania, containing two churches, and three thousand inhabitants; with some manufactures of cloth; fifty-six miles east of Königsberg.

GUMBÖRTZ', a town of Russia, in the government of Olonetz; sixteen miles south of Olonetz.

GUMFELL'DIZAN', a town of Spain, in Old Castile; twenty-eight miles west of Ofima.

GUMPEN, a town of Switzerland, in the canton of Berne: five miles west of Bern.

GUMPOLIAM, a town of Hindoostan, in the My-fore country: fifty-three miles north-north-east of Bat- galeore, and ninety-eight east of Chittledroog.

GUMMA, a town of Japan, in the province of Kootjeke.

GUMMA, f. In pathology, a diseane or tumour arising out of the sub stance of a bone, whereby it becomes so soft as to yield to the finger. When these tumours are harder they are called tights; when harder still, they receive the name of nodes: but the harder tumours in bones are escofites. In venerable patients such tumours occur on the head, and even in the middle of the most solid bones. They seem to be produced when the vessels running between the bony lami nix, being either obstructed or inflamed, are dilated, and so raise the incumbent laminae. Perhaps the bone degenerates too into a morbid softness. A softness of the bones sometimes succeeds abceffes of the adjacent parts; and sometimes the origin of the disordered is lodged in the sub stance of the bone, especially in the luce veins; gummata have, however, been discovered, when no such adequate cause could be observed. See SURGERY.

GUMMATA, f. pl. In medicine, tumours of a fru- mous kind. Scott.

GUMMATED, adj. Smeared over with gum, glazed with gum. Scott.

GUMMINESS, f. The state of being gummy; accumulation of gum. The tendons are involved with a great gumminess and collection of matter. Wiseman.

GUMMINING, f. The act of joining as with gum; the juncture occaioned by a viscous matter.

GUMMOSE', adj. Abounding with gum, gummy.

GUMMOSITY, f. The nature of gum; gummifies. Sugar and honey make windy liquors, and the clastic fermenting particles are detained by their innate gummosity. Floyer.

GUMMOUS, adj. Of the nature of gum; Observations concerning English amber, and relations about the amber of Prussia, prove that amber is not a gummum: or viscous sub stance drawn out of trees by the sun's heat; but a natural fossil, Woodward.

GUMMY, adj. Confisting of gum; of the nature of gum. From the utmost end of the head branches there issue out a gummy juice, which hangeth downward like a cork. Raleigh.

How each ariding now appears.

And o'er the Po dills her gummy tears. Dryden. 

Productive of gum:

The flant lightnings; whose thwart flame driv'n down, Kindles the gummy bark of fir and pine. Milton.

Overgrown with gum:

The yawning youth, scarce half awake, effays His lazy limbs and dozy head to raise; Then rubs his gummy eyes, and scrubs his pate. Dryden.

GUM-PENSTEIN, a town of Germany, in the arch- duchy of Styria; sixteen miles west of Rottebnann.

GUM-POLTSKIRCHEN, a town of Germany, in the archduchy of Austria; eight miles south of Vienna.

GUM'S, f. [goms, Sax. gummic. Dut.] The hard bulky substance in either jaw, through which the teeth penetrate. The gums are apt to become spongy, and to separate from the teeth; and the cavity is frequently a sty or tamarisk kind of cruit, which forms itself there, but which when separated by an operation which the dentists call fisting, the gums soon return to their former state. If rubbed daily with a brush composed of very stiff bristles, the tartar will not only be prevented from accumulating, but the gums, being tender and apt to bleed, will become hard and firm. Cold water is as useful as any other wash, but some choose to join with it one part in four of tincture of myrrh. The cure of another disorder which affects the gums; indeed, when a scorbatic disorder invades the whole body, its first symptom is a putrid state of the gums. See the article ANATOMY, vol. i. p. 543.

GUMSOOR', a town of Hindoostan, in the county of Orissa: eighty miles south-west of Cattack. Lat. 19. 45. N. lon. 84. 49. E. Greenwich.

GUN, f. [Of this word there is no satisfactory etymology. Mr. Lye observes that gun in Iceland signifies bat; but when guns came into commerce with Iceland. May not gun come by gradual corruption from guna, gunne, gunne? Coke is the original of cannon.] The general term for firearms; which includes every kind that discharges a ball or shot through a cylindrical tube by means of gunpowder, except mortars and piftois, which are never distinguished by the name of gun; though such as are loaded and discharg'd by air, and all sort of pikes, are thus denominated.

Some there are who range the purple heath

Or naked fluffy, where from field to field

The founding covesy urge their lab'ring flight,

Eager amid the rising cloud to pour

The gun's unerring thunder. Armstrong.

It is impossible to ascertain at what period of time these weapons were first invented; for though the introduction of guns into the western part of the world is of modern date, comparatively speaking, yet it is certain that in some parts of Asia they were used in very remote ages, though in a rude and imperfect manner. Philostratus speaks of a city near the river Hyphasis in the Indus, which was said to be impregnable, and that the inhabitants were relations of the gods, because they threw thunder and lightning upon their enemies; and other Greek authors, as also Quintus Curtius, speak of the same thing having been experienced by Alexander the Great. Hence some imagine that guns were used by the eastern nations in his time; while others appose the thunder and lightning alluded to by those authors were only artificial fire-works, or rockets, such as we know are used in the wars by the Indians even in the present day against the Europeans. But if this fact only be admitted, it will serve to shew the great antiquity of gunpowder; and if this antiquity of gunpowder be admitted, it gives some colour to the allusion of certain modern travellers, who pretend to have discovered that guns were used in China as far back as the year of Christ 85. Hyde, in his Hist. Shalihudii, p. 175, informs us, that the Indians had for many centuries the use of gunpowder, and of machina for firing forth fire; and that the Chineses learned the knowledge of them from the Indians, and it appears in his Hist. Phil. p. 89, that the Saracens got it from the Chinese. But Mr. Pennant, in his Outlines of the Globe, p. 103, says, 'The first guns or cannon ever cast in China, were the work of a Jesuit, father Adam Schaal, by order of the emperor. The next of father Verbiest, the great ornamant of the order; he first cast a hundred and thirty, and after that three hundred
and twenty. They were tried in the presence of the emperor, who greatly approved the services of Verbiest, that he loaded him with honours. The Jesuits, in return, fixed on a day for blessing his labours. Dressed in his religious habit, he nine times professed himself, and beseeched God for France. He had previously fixed a crucifix on an altar before the train of artillery, which he baptized piece by piece, and gave to each the name of some male or female saint, taken from the calendar of his own church. Though gunpowder was unquestionably of very early invention in China and in India, yet till the time above-mentioned it was never applied to any other uses than fire-works on festive occasions, in which the Chinese still excel all the rest of the world.

It is, however, sufficiently known by those who have made ancient tactics the subject of their study, that the Greeks and Romans used miliile fires, such as burning arrows, and other instruments of fiery destruction, which they either cast by means of engines and machines, or hung with the hands into the places besieged. Vegetius in his book De re militari, and Leo in his Tactica, treat very fully of these facts. The former, among his precepts to those who study the art of war, has the following passage: "If there should be houfes in the fortres, or place besieged, of such materials as may be easily kindled, you may build them by means of fiery arrows directed various ways, especially if the wind blow violently. You may also use squared stones full of fire, and manganica alucotia, which project flames, &c. Among the Greeks and Romans we do not find any mention of fulvix nitratus, or gunpowder; though the famous Greek fire must have partaken intimately of its nature composition; and probably of the muriatic acid. See the article Artillery, vol. ii. p. 232.

The records contained in several Arabic manuscripts deposited in the Escorial library, thus describe the various instruments of destruction used in 1249 among the Arabs: "Scorpions twisted round and blazing with nitrous powder, crept along, burning as they went, and length exploding, they send forth flames like lightning, and burn: then you may behold a manganum discharged, stretching like a cloud through the air, making a noife like thunder, and vomiting out fire on all sides, overthrowing, burning, and reducing all things to ashes."

From this passage it would appear that the author alluded to the bombs of iron, burnt by means of artifical fire; for he uses the words nephata and barud, of which, in those times, gunpowder was composed. By the word barud, the Perians, Turks, and Arabians, formerly understood nitre. At present they use it to express nitrous powder, or gunpowder. A noble writer of Granada, Abu Abdallah El Alkatib, in his History of Spain (about the year of Christ 1512), speaking of the globes or balls exploded by means of naptha over the heads of enemies, has the following passage: "Abu-I Valid Imuel ben Naller, at that time king of Granada, moving his camp, laid siege to the town of Beza, where he exploded, at the tow'ered fortress, by means of fire, an immense machine furnished with naptha and a globe or ball, making a loud noife.

That the early use of such instruments of war obtained among the Arabs, may be gathered from the Chronicle of Alfonso XI. c. 223, wherein we read, that whilst Algezira was besieged, in 1350, the Moors discharged many peals of thunder upon the army, casting iron balls equal in size to very large apples, some of which went so far as to pass the station of the troops. In the same work, c. 227, the matter is more clearly expressed: "In the year 1352, five vessels entered the port, laden with corn, honey, butter, and the powder with which thunder was darted forth," &c. Of the former transaction Peter Mexia takes notice, and adds: "The people of Castile ridiculed, but he is silent on the other." Proving, however, the great antiquity of those machines, he mentions a few-fight between the Tunisians and Spaniards, in which the ships of the Mahometans were furnished with cannon royal, or carthoun, 48 - 50
Battard cannon, or 4 carthoun, 36 - 79
Demi-carthoun, - 24 - 60
Whole culverin, - 18 - 50
Demi-culverin, - 9 - 30
Falcon, - 6 - 25
Saker ordinary - 3 - 15
Saker lowert fort - 5 - 15
Baliflip, - 48 - 85
Serpentine - 4 - 8
Aspic - 4 - 7
Dragon, - 6 - 32
Syren, - 60 - 82
Valconet, - 3, 2, and 1 - 15, 10, 5
Robinet, - 1
Moyens - 10 of 1 oz.

These curious names of beasts and birds of prey were not invidiously applied, on account of their swiftness in motion, or of their cruelty; as the falconet, falcon, faker, and culverin, &c. for their swiftness; the baliflip, terpentine, aspic, dragon, fyrren, &c. for their cruelty. But now all cannon take their names from the weight of their proper ball. Thus a piece that discharges a cafl-iron ball of twenty-four pounds, is called a 24-pounder; one that carries a ball of twelve pounds, is called a 12-pounder; and so of the rest, divided into the following sorts, viz. Ship-guns, consisting in 24, 22, 22, 18, 18, 13, 9, 6, and 3, pounders. Garrison-guns, in 42, 32, 24, 18, 18, 13, 9, 6, and 6, pounders. Battering-guns, in 24, 18, and 12, pounders. Field-pieces, in 24, 9, 6, 3, 2, 1, and 1, pounders. Mortars,
GUN.

Mortars, as we have seen above, are unquestionably more ancient than cannon. They were employed in the wars of Italy, to throw balls of red-hot iron, stones, &c. long before the invention of shells, which were of German origin. The first account of shells used for military purposes, is in 1435, when Naples was besieged by Charles VIII. Mr. Malter, an English engineer, first made the art of the small cannon the art of forgery, whereby he practised at the siege of Motte in 1634. The method of throwing red-hot balls out of mortars appears to have been first put in practice, in modern tactics, at the siege of Straßburg in 1675 by the elector of Brandenburg; though others say in 1653, at the siege of Bremen.

Another species of ordnance has been long in use, by the English, which is called a Carronade, and consists of a cylindrical rod of tempered iron, called a mandril, which has a number of furrows or moulds of the anvil, is hammered together by heating the tube in lengths of two or three rods, and the latter scarcely ever occurring but in barrels forged longitudinally; and then only when the iron is of a superior quality. When external and superficial, they are all defects in point of neatness only; but, when situated within the barrel, they are of a material disadvantage, by affording a lodgment to moisture and foulines that corrode the iron, and thus continually enlarge the excavation until the barrel bursts, or becomes dangerous to use.

The barrel, when forged, is either finished in the common manner, or made to undergo the operation of twilling, which is a process employed on those barrels that are intended to be of a superior quality and price to others. This operation consists in heating the barrel, in portions of a few inches at a time, to a high degree of red heat; when one end of it is screwed into a vice, and into the other is introduced a square piece of iron with a handle like an auger; and, by means of the tube, the fibres of the heated portion are twilled longitudinally, and then only when the iron is of a superior quality. When external and superficial, they are all defects in point of neatness only; but, when situated within the barrel, they are of a material disadvantage, by affording a lodgment to moisture and foulines that corrode the iron, and thus continually enlarge the excavation until the barrel bursts, or becomes dangerous to use.

To persons unacquainted with the lofts which iron suffers in forging, it will be a matter of surprize that twelve pounds of iron are required to produce a barrel, which, when finished, shall not weigh more than two pounds, or two pounds and a half. But, although a considerable waste is unavoidable, yet the quantity of it depends very much upon the quality of the iron, upon that of the coal, and upon the knowledge and dexterity of the workmen. In Spain they cannot work but with charcoal of wood; in France they employ pit-coal with phur and arsenic which render the metal altogether un-malleable, or, in the language of the workmen, poison the iron.

A circumstance of considerable importance to the excellence of a barrel, is, the forging it as near as can be to the weight it is intended to be of when finished, so that very little be taken away in the boring and turning the barrel round, by the outer surface, so as to have the action of the hammer more immediately than any other part, is rendered the most compact and pure, we should be careful to remove as little of it as possible: the fame thing holds, though in a less degree, with regard to that portion of the inside of the barrel which is to be cut out by the boring instrument.
Pistol-barrels are forged in one piece, and are cut afunder at the muzzles after they have been bored; by which there is not only a saving of iron and of labour, but a certainty of the caliber being perfectly the same in both pieces.

The next operation consists in giving to the barrel its proper caliber; this is termed boring. The boring-bit is a rod of iron, somewhat longer than the barrel; one end being made to fit the socket of the crank, and the other being furnished with a cylindrical plug of tempered steel, about an inch and a half in length, and having its surface cut in the manner of a perpetual screw, the threads being flat, about a quarter of an inch in breadth, and running with very little obliquity. This form gives the bit a very strong hold of the metal; and the threads, being sharp at the edges, scoop out and remove every roughness and inequality from the inside of the barrel, and render the cavity smooth and equal throughout. A number of bits, each a little larger than the preceding one, are afterwards successively passed through the barrel in the same way, until it has acquired the intended caliber. The equality of the bore is so essential to the excellence of a piece, that the greatest accuracy in every other particular will not compensate for the want of it. Any person who wishes to judge of the merit of his piece in this respect, may do it with tolerable accuracy, by means of a plug of lead, cast on a rod of iron or wood; or even by a musket-ball, filed so as to fit the bore exactly, and pushed through the barrel by the ram-rod, care being taken not to use an iron ram-rod, or much force, lest the ball be flattened, and an artificial difficulty created.

The barrel may now be considered as quite finished, with regard to its inside; at least it has nothing more to be done to it by the maker. The gunsmiths, however, generally make it undergo a farther operation of polishing, after which it is in a condition to receive its proper form and proportions externally, by means of the file. To do this with accuracy, four flat sides or faces are first formed; then eight, then sixteen; and so on, until it is made quite round; except the reinforced part, which in most of the modern fowling-pieces is left with eight sides. This octagonal form of the reinforced part is certainly more elegant than the round one formerly in use. But it adds to the weight of the barrel; and it is not infrequent that the powder will always be furnaced by the thinnest part of the circumference, without any regard to those places that are thicker than the rest.

It is absolutely necessary to the foundness of a barrel, that it should be of an equal thickness on every side; for, in the language of the workmen, a barrel ought to be perfectly upright. In order to arrive, as nearly as possible, to this perfect equality, the gunsmiths employ an instrument which they call a compass. This consists of an iron rod bent so as to form two parallel branches, about an inch distant from each other. One of these branches is introduced into the barrel, and kept closely applied to the side by means of one or more springs, with which it is furnished; the other branch defends, parallel to this, on the outside, and has several screws passing through it, with their points directed to the barrel. By freqeuently turning these until their points touch the surface of the barrel, and then turning the instrument round within the bore, it is seen where the metal is too thick, and how much it must be reduced in order to render every part of the barrel perfectly equal throughout its circumference. To form the screw in the breech-end of the barrel, the first tool employed is a plug of tempered steel, somewhat conical, and having upon its surface the threads of a male screw. This tool, which interments a screw-tap, being introduced into the barrel, is turned from left to right, and back again, until it marked out the three or four first threads of the screw; another less conical tap is then introduced; and, when this has carried on the impress of the screw as far as it is intended to go, a third tap is employed, which is nearly cylindrical, and scarcely differs from the plug of the breech, which is intended to fill the screw thus formed in the barrel. The breech-plug has its screw formed by means of a screw-plate made of tempered steel, and has several female screws corresponding with the taps employed to form that in the barrel. A plug of seven or eight threads is sufficiently long; and the threads ought to be neat and sharp, so as to fill completely the turns made in the barrel by the tap. The breech-plug is afterwards case-hardened, or has its surface converted into steel, by being covered over with hardening of horn, or parings of horse-hoof, and kept red-hot in the fire for some time, after which it is plunged into water.

The last operation in fowling-pieces is that of colouring the barrel; previous to which it is polished with fine emery and oil, until it presents to the eye, throughout its whole length, and in whatever direction we observe it, a perfectly smooth, equal, and splendid, surface. Formerly these barrels were coloured by exposing them to a degree of heat which produced an elegant sunset tint, but the practice of calcination taking place upon the surface of the metal, the inside of the barrel always suffered by undergoing the same change. This, therefore, added to the painful sensation excited in the eye, by looking along a barrel so coloured, has caused the practice of bluing to be diffused for some time past. Instead of it, barrels are now browned for all fowling-pieces. To do this, the barrel is rubbed over with aqua-fortis, or spirit of salt, diluted with water, and laid aside until a complete coat of rust is formed upon it; a little oil is then applied; and the surface, being scoured, is polished by means of a hard brush and bees-wax.

When the barrels intended for a double-barrelled piece are drilled to their proper thicknesses, which is generally less than for single barrels, each of them is filed flat on the side where it is to join the other, so that they may fit closely together. Two corresponding notches are then made at the muzzle and breech of each barrel; and into these are fitted two small pieces of iron, to hold them more firmly together. The barrels being united by the elevation of the hoop, the ribs are fitted in, and made fast by the same means. These ribs are the triangular pieces of iron which are placed between the barrels, running on the upper and under sides their whole length, and serving to hold them more firmly together. The under rib is a late invention, and is more especially used in the barrels of the most celebrated for their superior elegance and strength, as well as for the accuracy with which they throw either ball or shot. The iron employed in them is formed of stubs, which are old horse-shoe nails, procured from country farriers, and from poor people who gain a subsistence by picking them up on the great roads leading to the metropolis. These are originally formed from soft and tough iron that can be had; and the metal is still further purified by the numerous heatings and hammerings it has undergone in being reduced from a bar into the size and form of nails. They consist of about ten filplings the hundred-weight, and twenty-eight pounds are required to make a single barrel of the ordinary size. A hoop of iron about an inch broad, and six or seven inches diameter, is placed perpendicularly; and the stubs, previously freed from dirt by washing, are next gilded in, with their heads outermost on each side, until the hoop is quite filled and wedged tight, with another less conical tap is then introduced; and, when this has carried on the impress of the screw as far as it is intended to go, a third tap is employed, which is nearly cylindrical, and scarcely differs from the plug of the breech, which is intended to fill the screw thus formed in the barrel. The breech-plug has its screw formed by means of a screw-plate made of tempered steel, and has several female screws corresponding with the taps employed to form that in the barrel. A plug of seven or eight threads is sufficiently long; and the threads ought to be neat and sharp, so as to fill completely the turns made in the barrel by the tap. The breech-plug is afterwards case-hardened, or has its surface converted into steel, by being covered over with hardening of horn, or parings of horse-hoof, and kept red-hot in the fire for some time, after which it is plunged into water.

The last operation in fowling-pieces is that of colouring the barrel; previous to which it is polished with fine emery and oil, until it presents to the eye, throughout its whole length, and in whatever direction we observe it, a perfectly smooth, equal, and splendid, surface. Formerly these barrels were coloured by exposing them to a degree of heat which produced an elegant sunset tint, but the practice of calcination taking place upon the surface of the metal, the inside of the barrel always suffered by undergoing the same change. This, therefore, added to the painful sensation excited in the eye, by looking along a barrel so coloured, has caused the practice of bluing to be diffused for some time past. Instead of it, barrels are now browned for all fowling-pieces. To do this, the barrel is rubbed over with aqua-fortis, or spirit of salt, diluted with water, and laid aside until a complete coat of rust is formed upon it; a little oil is then applied; and the surface, being scoured, is polished by means of a hard brush and bees-wax.

When the barrels intended for a double-barrelled piece are drilled to their proper thicknesses, which is generally less than for single barrels, each of them is filed flat on the side where it is to join the other, so that they may fit closely together. Two corresponding notches are then made at the muzzle and breech of each barrel; and into these are fitted two small pieces of iron, to hold them more firmly together. The barrels being united by the elevation of the hoop, the ribs are fitted in, and made fast by the same means. These ribs are the triangular pieces of iron which are placed between the barrels, running on the upper and under sides their whole length, and serving to hold them more firmly together. The under rib is a late invention, and is more especially used in the barrels of the most celebrated for their superior elegance and strength, as well as for the accuracy with which they throw either ball or shot. The iron employed in them is formed of stubs, which are old horse-shoe nails, procured from country farriers, and from poor people who gain a subsistence by picking them up on the great roads leading to the metropolis. These are originally formed from soft and tough iron that can be had; and the metal is still further purified by the numerous heatings and hammerings it has undergone in being reduced from a bar into the size and form of nails. They consist of about ten filplings the hundred-weight, and twenty-eight pounds are required to make a single barrel of the ordinary size. A hoop of iron about an inch broad, and six or seven inches diameter, is placed perpendicularly; and the stubs, previously freed from dirt by washing, are next gilded in, with their heads outermost on each side, until the hoop is quite filled and wedged tight, with
with them; the whole resembling a rough circular cake of iron. This is put into the fire until it has acquired a white heat; when it is thus prepared, either by the strength of the arm, or by the force of machinery, until it coalesces, and becomes one solid mass of iron: the hoop is then removed, and the heatings and hammerings repeated until the iron, by being thus wrought and kneaded, is freed from every impurity, and rendered very tough, and close in the grain; the workman then proceeds to draw it out into pieces of about twenty-four inches in length, half an inch more in breadth, and half an inch in thickness.

These pieces, however, are not all of the same thickness; some being more and others less than what we have mentioned, according to the proposed thicknesses of the barrel, and clouts in the grain, the workman then proceeds to draw it out into pieces of about twenty-four inches in length, half an inch more in breadth, and half an inch in thickness.

The Spanish fowling-pieces have always been held in great esteem, as well on account of the quality of the iron, which is generally considered as the best in Europe, as because they possess the reputation of being forged and bored more perfectly than any others. It should be observed, however, that, of the Spanish barrels, those only that are made in the capital are accounted truly valuable; in consequence of which a great many have been made at other places, especially in Catalonia and Biscay, with the names and marks of the Madrid gunsmiths: they are also counterfeited at Liege, Prague, Munich, &c., and a person must be a very good judge not to be deceived by these spurious barrels.

There are, notwithstanding, there have always been excellent gunsmiths at Madrid, yet the barrels which bear the highest price, and are the most sought after by the curious in this way, are those made by artists who have been dead for many years; though perhaps this preference has no better foundation than the common prejudice in favour of things that are the productions of remote ages or distant countries. Major Langres mention this. Such are the barrels of Nicolas Biz, who was famous at Madrid in the beginning of the last century, and died in 1744: those he made in the former part of his life are the most esteemed. The barrels of Juan Belen, and Juan Fernandez, contemporaries of Nicolas Biz, are preferred to the rest, and in France all of them fell for one thousand livres, or forty-three pounds sterling.

Theo of Diego Equibel, Alonzo Martinez, Gabriel Agora, Agostin Ortiz, Mathias Vaera, Luis Santos, Juan Santos, Francisco Garcia, Francisco Tar-garone, Joseph Cano, and N. Zelaya, all of them celebrated workmen, who succeeded those already mentioned, in the order of their names, are all in great request. Of the artists now or lately living at Madrid, who celebrated are, Francisco Lopez, Salvador Cenarro, and Miguel Zeguarro, gunsmiths to the king: Isidoro Soler, and Juan de Soto, have also great reputation. The barrels of those living workmen fell for three hundred French livres, or somewhat more than thirteen pounds sterling, which is the price paid for those made for the king and royal family. They are proved with a treble charge of the best powder, and a quadruple one of swan or deer shot. At Madrid, and throughout all Spain, the manufacture of barrels is not, as in this and most other countries, a separate branch of the gun-making business; but the same workman makes and finishes every part of the piece.

After the barrels of Madrid, those of Pufindui and St. Olabe at Placentia in Biscay, and of Jean and Clement Pedroevita, Ludal Pous, and Martin Marchal, at Barcelona, are the most esteemed; those usually fell in France for eighty French livres, or three pounds ten shillings sterling. Almost all the fowling-piece barrels made at Madrid are composed of the old shoes of horses and mules, collected for the purpose. They are all welded longitudinally; but, instead of being forged in one plate or piece, as in other countries, they are made, like the English twisted barrels, in five or six detached portions, which are afterwards welded one to the end of another, two of them forming the breech, or reinforced part of the barrel. We may form some idea of the very great purity to which the iron is brought in the course of the operation, when we are told, that to make a barrel, which, rough from the forge, weighs only five or seven pounds, they employ a mass of mule-skins, and flesh weighing from forty to forty-five pounds: for that from thirty-four to thirty-eight pounds are lost in the heatings and hammerings it is made to undergo before it is forged into a barrel.

Notwithstanding the great reputation of the Spanish barrels, however, they are little used in France, and still less in England; their awkward form, and their great
great length and weight, being strong objections to them, as is evident from our own experience of the Spanish barrels, we are convinced, that the avidity with which they are sought after by some perfons, and the extravagant prices that are given for them, proceed more from a fancied than from any real superiority they possess over those made in this country. The barrels of Lazaro Cominazzo, called, after the maker, Lazarini, were formerly celebrated throughout the greatest part of Europe. They were very long, and of a small caliber. Cominazzo lived at Brescia about a hundred and sixty years ago. He did not forge these barrels himself, but he finished them with great accuracy, and ornamented them in a very rich and elegant manner. At the time, however, when these barrels were in high estimation, there were numerous counterfeiters bearing the name and mark of Cominazzo; and it requires some acquaintance with the genuine barrels not to be deceived by the spurious ones. The true Lazarini are now to be found only in the repositories of the curious.

The vanity of puffing for nothing that is singularly curious is the false idea that whatever is expensive must necessarily be good, and sometimes, though rarely, the laudable desire of improvement, have all, in their turn, been the causes of variety of experiments being made in the manufacture of barrels. Mr. Fuller, of St. John's-street, Clerkenwell, whofe superior excellence in this branch deserves to be known by every sportman, for his superior excellence in this branch deserves to be known by every sportman, for his superior excellence in this branch deserves to be known by every sportman, for his superior excellence in this branch deserves to be known by every sportman. He has forged barrels from old scythes, from wire, from needles, and a great many other articles suggested by the whim of his customers; he has also made barrels with a lining of steel, and formed others with a double spiral of steel and iron alternately; but that, as far as he can determine from these numerous trials, the steel wrought into a twisted barrel, is superior to every other. Wherever feel was employed, he found that the barrel neither welded nor bored so perfectly as when iron alone was used.

PROOFS OF BARRELS.

These differ in different countries. The Spanish proof is a very severe one; but, as it is made before the barrel is fired, it is not satisfactory. At the royal manufactories of St. Etienne and Charleville, in France, there were inspectors appointed to see that no barrels are sent out of these places, whether for the king's use or for public sale, without being, by every sportsman, for his superior excellence in this branch deserves to be known by every sportman, for his superior excellence in this branch deserves to be known by every sportman, for his superior excellence in this branch deserves to be known by every sportman, for his superior excellence in this branch deserves to be known by every sportman. He has forged barrels from old scythes, from wire, from needles, and a great many other articles suggested by the whim of his customers; he has also made barrels with a lining of steel, and formed others with a double spiral of steel and iron alternately; but that, as far as he can determine from these numerous trials, the steel wrought into a twisted barrel, is superior to every other. Wherever feel was employed, he found that the barrel neither welded nor bored so perfectly as when iron alone was used.

The usual proof of the Paris barrels is a double charge of powder and shot; that is, two or two and a half drachms of powder, and two or two and a half ounces of shot. The English Tower proof, and that of the Whitechapel company, incorporated by charter for proving of arms, are made with a ball of the caliber, and a charge of powder equal in weight to this ball; the proof is the same for every fize and species of barrel, and not repeated. Some gunsmiths pique themselves upon making their barrels undergo a second proof, but it is proper to observe, that, if a barrel bears any aligned proof, it will fail the proof immediately after, with greater safety than it did at first, as the metal, from being warmed by the first fire, expands more readily to the force of the second explosion.

OF PROOFS.

Mons. de Marelles, speaking of the proofs of barrels, says, "A stronger proof than ordinary might be made, by ramming down at the top of the powder, six or eight inches of dry clay, in place of a double charge of lead. This is sometimes employed in proving pieces of ordnance, where, instead of the bullet, two feet of clay is placed over the powder, by which the whole force of the explosion is exerted upon the piece. We entirely agree with the ingenious author of Le Chafse au Fusil, in the opinion, that the proof he mentions would be much stronger than that which is usually employed; so much stronger, indeed, that we do not believe any barrel could withstand it unless the clay were put down in the loofest manner possible. The hardest rocks are burst asunder by means of dry clay strongly rammed over the powder that is placed at the bottom of a cylindrical cavity made in them; and we certainly cannot expect that a force sufficient to rend in pieces immense blocks of granite, can be refisted by the comparatively trifling strength and thickness of a gun-barrel.

CAUSES OF BURSTING.

It may be safely asserted, that a good barrel can scarcely ever burst, unless it be charged too highly, or in an improper manner. Whenever, for example, from the ball not being rammed home, a space is left between it and the powder, there is a great risk of the barrel bursting on being discharged. We say a great risk, because, even in the most perfect barrels, it is frequent that the barrel does not burst. If the ball drops near to the powder, a very small windage is sufficient to prevent this accident; and it is very rare that the ball touches the barrel in every part of its circumference, unless it has been driven in by force with an iron ramrod, in which case it moulds itself to the barrel, and blocks it up completely. Should this hap- pen, the barrel, however strong it is, will burst, even when the space between the ball and the powder is but very inconsiderable; and, the greater the space that intervenes, the more certainly will this event takes place.

Mr. Robins, when speaking of this matter, says, "A moderate charge of powder, when it has expanded itself through the vacant space that reaches the ball, will, by the velocity each part has acquired, accumulate itself behind the ball, and thereby be condensed prodigiously; whence, if the barrel be not of an extraordinary strength in that part, it must infallibly fly to pieces. The truth of this has been experienced in a Tower musket, forged of very tough iron; for, charging it with twelve pennyweights of powder, and meticulously proving it, the barrel burst when the bullet was swelled out to double its diameter, like a blown bladder, and two large pieces of two inches long were burst out of it."

The same accident will often take place from the mouth of the piece being filled with dirt or snow, as sometimes happens when sportsmen are leaping a ditch with the muzzle of the piece pointed forwards; and, if such cases the barrel does not burst, it is because the foreign bodies stop it up but very loosely. For the same reason a barrel will certainly burst, if fired when the muzzle is thrust into water but a very little depth below the surface; the resistance given the passage of the ignited powder through the mouth of the piece being, in this case, much greater than that afforded by the sides of the barrel. Except in the circumstances mentioned, or in case of an overcharge, it is very rare that a barrel bursts. Whenever it happens independent of these causes, it must be from a defect in the work, and that either the barrel has been imperfectly welded, or, lastly, that, through want of care in the boring, it is left of unequal thickness in its sides. The last defect is the most common, especially in low-priced barrels; and, as pieces more frequently burst from that than
than from the other defects, it ought to be particularly guarded against. The elastic fluid which is let loose by the inflammation of the powder, and which endeavours to expand itself equally in every direction, being repelled by the stronger parts, acts with additional force against the weaker ones, and frequently bursts its way through the barrel, which would not have been the case, had the holes been of the same thickness and strength, and afforded an equal repercussion. The weakness of any part of the barrel, occasioned by the inequality of the caliber, will still more certainly be the cause of bursting than that produced by the filing; because the inflamed fluid, being suddenly expanded at the wider part, must suffer a compression before it can pass outward, and the whole force is then exerted against the weak place; for gunpowder acts as the radii of a circle, and exerts the same force on every part of the circumference of the circle. The conclusion to be drawn from all this is, that a thin and light barrel which is perfectly upright, that is, of equal thickness in every part of its circumference, is much less liable to burst than one which is considerably thicker and heavier, but which, from being badly filed or bored, is left of unequal strength in its sides.

In all that we have hitherto said upon the causes of bursting, the bad quality of the iron has not been taken into account. It must not be overlooked that the edges of the barrel, where it is worked, are extremely thin, and that the whole force is then exerted against these defects, whether arising from the badness of the metal, or from the insufficiency of workmanship, except by purchasing from a gunsmith of established reputation, and giving a good price for the piece. But by this we do not mean to function the practice of many of the gunsmiths in the fashion of the day; we are confident in our opinion, that most of their barrels are made too thin; and it may be fairly doubted, whether they have at all improved the quality of the metal. In some experiments made with a barrel of the celebrated Lazaro Cominazzo, before-mentioned, and which was five feet ten inches in length, and extremely thin, particularly towards the muzzle, it was observed, that the barrel vibrated so much after the explosion of the charge, as to produce a ringing sound that might be heard to a considerable distance from the barrel. And yet this piece, notwithstanding its extreme thinness, was fired with very high charges. The iron appeared to be of an extraordinary fine quality, which goes to prove that the cause of the inequalities in its thickness is, the powder being placed at some distance from the breech-plug, so that the powder, instead of being fired at its base, is fired near the centre of the charge; whence, it is said, the recoil is increased, and the force of the discharge weakened, by the effort of the powder being exerted more upon the breech than upon the ball or shot.

A barrel mounted on a stock that is of equal weight, will recoil more than when mounted on a stock that is considerably bent, as the curvature serves to break and deaden the force of the recoil; and, sometimes also, a fowling-piece will recoil from the shooter applying it improperly to his shoulder; for, if the butt is not applied closely to the shoulder, or is applied so as to be supported only at a single point, the recoil will be much more sensible than when the whole bottom of the barrel embraces the shoulder, and is firmly supported by the weight of the body. Guns are observed to recoil more after being fired a number of times than they did at the beginning. The matter, which is left upon the inside of the barrel after the explosion, and which increases on every discharge, attracts moisture very quickly; especially if the falt pistol employed in the powder was not well purified from the admixtures of common salt which it contains in its rough state. This moisture becomes considerable after a few discharges, and, being formed into vapour by the heat during the explosion, adds its expansive effort to that of the inflamed powder, and greatly increases the agitation and recoil. Owing to this cause, probably, rather than to that before-mentioned, arises the recoil from some turns of the breech-screw not being filled up by the breech-plug, and thereby affording a lodgment to moisture.

Among the variety of caufes to which the excessive recoil of pieces has been attributed, there is one which, in our opinion, is the true one. In the point of the barrel, or the part which is placed at some distance from the breech-plug, it is found that the powder, instead of being fired at its base, is fired near the centre of the charge; whence, it is said, the recoil is increased, and the force of the discharge weakened, by the effort of the powder being exerted more upon the breech than upon the ball or shot. With this idea in view, some gunsmiths form a channel or groove in the breech-plug, as deep as the second or third turn of the screw; the touch-hole opens into this channel, and the powder is thereby fired at its very lowest part; and thus, it affects, increases the inflammation and the force of powder. That the distance of the touch-hole from the breech, however, has very little influence in the increase of the recoil, we shall prove in the most satisfactory manner from experiments made purposely to determine this point. As to the idea, that the force of the discharge is diminished by the increase of the recoil, it is too absurd to require discussion; the force exerted by the powder upon the breech, is always equal to that which it exerts upon the ball or shot; so that, if there be nothing in the barrel that retards the exit of the ball, an increase in the recoil will be always attended with an increase in the force of the discharge.

The following experiments were made by Mons. le Clerc, who was gunsmith to the late king of France, and well informed upon every subject that relates to his
his profession; they were communicated by him to Monf. de Marolles. These experiments were made with a barrel which was thirty French inches in length (nearly thirty-two English measure,) and weighed, together with the loaded planks upon which it was fixed, twenty-eight pounds. The barrel had four touch-holes, which could be stopped with screws. The charge consisted of one dram and twelve grains of powder from a royal manufactory, and of one ounce eighteen grains of shot called small 4. This was fired at a sheet of paper measuring twenty inches by sixteen, French measure, placed at the distance of twenty-eight fathoms, or nearly forty-five ordinary paces. The only difference was, that in the first set of experiments the wadding consisted of card-paper, and in the second of hat, both cut to fit the caliber.

Had these trials been made with no other view than to determine the degree of recoil produced by the different situation of the touch-hole, there would have been no use in marking the size of the shot, the distance and dimensions of the mark, and the number of grains thrown into it at each discharge. It was, however, intended to try at the same time, how far the equality of the discharge could be depended upon, with regard to the number of grains that struck a given space; and we shall have occasion hereafter to make some remarks upon the result of the trials in this respect. It must be recollected that the French foot is three quarters of an inch longer than the English foot, and the French inch is divided into twelve lines. We have thought it better to apprise the reader of this, and leave the table as it is, than make any fractions in the numbers by reducing it to English measure.

</table>

From these experiments it appears, that, with regard to the recoil, the distance of the touch-hole from the breech is of little importance. The only circumstance, therefore, to be attended to in its situation, is, that it be not placed quite close to the breech-plug; for, although that part of the barrel where the powder is lodged fouls much less than a few inches farther forward, yet the touch-hole, when close to the breech-plug, is found to be more frequently flapped up than when situated about a quarter of an inch from it.

### Of the Range of Barrels.

The lightness of bowling-pieces of a moderate length, and the ease with which they are managed, are advantages so obvious, and at the same time so considerable, as to give them a general preference at this time; but, as the circumstances upon which only this preference ought to be refted are little known, it is not sufficient that their use is general, and daily increasing, unless it former bulk, and perhaps a great deal more. The generally-received opinion upon this subject is, that, to obtain an increase in the range, the barrel must not only be made longer than usual, but that the length and the diameter of the bore ought to have a certain proportion to each other, and the charge of powder be suited to this proportion, as it is said, when the barrel is too short, the ball or diot quits it before it has received the whole impulse of the powder; and, on the other hand, when the barrel is too long, that the powder is not only all inflamed, but even partly consumed, before the ball or shot arrives at the mouth of the piece.

The elastic fluid produced by the firing of gunpowder is found, by experiment, to occupy, when cooled to the temperature of the atmosphere, a space, at least two hundred and forty-four times greater than that taken up by the powder from which it was obtained. But from the heat generated during the explosion, this elastic fluid is rarefied to upwards of four times its former bulk, and perhaps a great deal more. The expansive force of this fluid, therefore, is, at the moment of inflammation, one thousand times greater than that of common air, or, which is the same thing, the pressure of the atmosphere; or, supposing the powder to have occupied the space of one cubic inch, its expansive force, when fired, is equal to that which would be exerted by one thousand cubic inches of common air compressed into the space of one inch. As the velocity with which the flame of gunpowder expands when uncomprefled, is much greater than that with which the ball, or shot, moves forward, the flame must continue to press upon the ball, and add to its velocity, until it quits the mouth of the piece. This pressure, however, becomes less and less as the ball proceeds, and ceases entirely when it leaves the muzzle, in consequence of the flame being then allowed to expand itself laterally. Thus, for example, if the charge of powder takes up one inch of the barrel, and the whole length of the barrel be thirty inches, then, when the ball arrives at the muzzle of the piece, the inflamed powder (whose expansive effort is in proportion to the smallness of the space it occupies) extends through thirty times the space it did when the ball began to move, and consequently presses forward with but one-thirtieth part of the force it possessed at first. Moreover, although the velocity of the bullet is continually increased by this preflure of inflamed powder, its acceleration becomes less and less as it proceeds through the barrel; for, besides that the quantity of the pressure diminishes as the flame expands, the bullet, continuing to move faler and faler, must receive continually less and less addition of impulse from the flame prefling behind it. Hence, if two pieces of the fame bore, but of different lengths, are charged with the fame quantity of powder,
powder, the longer piece will, strictly speaking, communicate the greater velocity and force to its ball, or shot. But, as the inflammation of the powder has been shown to be nearly instantaneous, and as the increase of acceleration, which the ball or shot receives after the first impulse of the powder upon it, is not very considerable; it follows that the force with which two barrels of the same bore, and with the same charge, throw their ball or shot, will be nearly the same, unless their lengths be extremely disproportionate.

To prove this, we shall quote what is said by that able mathematician and engineer Mr. Benjamin Robins.

"If a musket-barrel, of the common length and bore, be fired with a leaden bullet and half its weight of equal, weights of the same powder and of the same feet. But, as the inflammation of the powder has been shown to be nearly instantaneous, the velocity of the ball will not hereby be fired with a leaden bullet and half its weight of equal, weights of the same powder and of the same feet. Thus, if a double charge of powder will not throw the ball or shot twice the distance, nor a treble charge to three times the distance, the single charge does. This arises from the great resistance given by the air to the motion of the ball or shot, and which is proved to be fourfold if the velocity be doubled, and ninetofold when it is trebled, by an increase of powder; for the resistance of the air is not proportional to the velocity itself, but only to the square of the velocity. Thus Bernouilli, mathematical professor in Basili, discovered from experiment that a ball which, being fired, ascended only twenty thousand and nine hundred feet in the air, would ascend fifty-eight thousand seven hundred and fifty feet in vacuo. Still we may safely infer, that, if the action of the powder be not diminished by circumstances of defect in the formation of the barrel, the greater the force of the powder, the greater must be the velocity of the ball. So great is the change in opinion of late, with regard to the proportion of fire-guns to barrel length, that many gunsmiths will now tell us, that short barrels carry farther than long ones; and the reason they give for this is, that the greater friction of the ball or shot in passing through a long barrel, by which their velocity is retarded and their force diminished.

If the barrel be so long that the additional impulse, which the ball or shot is continually receiving in its passage becomes less than the friction between them and the sides of the barrel, then, indeed, the barrel by being shortened will shoot with more force; but, as the length of barrel required to produce this effect is vastly greater than can ever be employed for any purpose, the objection does not hold. And it seems clear, that a piece may be made so long, that it will not throw a ball with so great a velocity as one that is considerably shorter; and the reason of this decrease of velocity may be, that in very long pieces the increase of the counterpressure of the external air in the cylinder may greatly exceed the force of the powder, and that theelastic fluid generated by the explosion of the powder is constantly escaping whilst the ball passes along the cylinder, which it not only does at the touch-hole, but also between the ball and the sides of the barrel; and hence may be inferred the necessity of touch-holes which do not prime of themselves, and of wadding that stops the barrel hermetically.

The circumstance of a duck-gun killing at a greater distance than a fowling-piece, is not owing to its length, but to its greater weight and thickness, allowing the charge of powder to be doubled, trebled, or even quadrupled; which cannot be done in a fowling-piece, though strongly reinforced. For a barrel of five or six feet, such as that of a common duck-gun, weighing five or six pounds, and the whole piece twelve or thirteen pounds, may be fired with a very large charge, without recoiling so much as to hurt the shooter, its weight being sufficient to resist the violent impulse occasioned by the increase of the powder. But in a fowling-piece of three feet barrel, sufficiently strong to withstand the charge, and whose whole weight all together does not exceed five or six pounds, the recoil is such as to us it appears that the beauty of those proportions is more attended to, than any good reason why they are made so rather than otherwise.
CAUSES OF SCATTERING THE SHOT.

From the prejudices which obtain so generally among sportsmen and gunsmiths, reflecting the shot of fowling-pieces, it is very natural to suppose, that a variety of means have been found, transferly only; this imprudence, in order to remedy this real or pretended defect of scattering the charge. M. de Marolles mentions several methods employed for this purpose, none of which, however, appear to be practised in England. One of the methods he describes is as follows: An iron or wooden mandril, fitted to the calibre, is firmed at one end with small nails, which are cut latirad only; this instrument, by being introduced into the barrel, is turned round by means of a cross-handle, and forms a great number of superficial scratches in the metal, by which, they pretend, the defect of scattering the shot is remedied.

One obvious effect of this operation is, that of destroying the smoothness of the barrel within, and thereby rendering it liable to foul the fooner; but we cannot conceive how the shot should be thrown closer by having the friction increased between it and the sides of the calibre; and that this will be the case, is evident, from a rough barrel being always found leaded considerably after every discharge. Some make the barrel wider towards four inches at the muzzle; and this bell-mouthed form is of very ancient date. Espinar, whose treatise has been approved by some gunsmiths, says, he has generally found this succeed in making barrels throw their shot closer. Were this true, we should expect to find this form of the barrel more generally used than it is at present, and not hear so many complaints among sportsmen of this defect.

When we consider that the grains of shot which are in actual contact with the sides of the barrel compose upwards of half the charge, we could not be surprised if enlarging the surface of the calibre at the muzzle, and thereby increasing the number of grains that touch it, should tend to make the shot be scattered more widely. Espinar says, that the fault of scattering the shot is not owing to the hand of the workman, the barrels of the best makers being equally subject to it as those of others. He is of opinion, that it arises from the different quality of the iron composing the several portions of the barrel. Thus, he says, it may happen that the reinforced part is formed of iron which is harder, and of a different grain, than that forming the fore part of the barrel; in consequence of which, and also from the fore part being so much thinner, the latter is the more shaken by the powder, and by that means produces a dispersion of the shot. He therefore pretends, that widening the muzzle in the manner already spoken of, by facilitating the explosion, diminishes the force of the powder upon this part, and causes the shot to be thrown more closely together. This opinion of Espinar, however, not only appears absurd in itself, but there is not even the smallest ground for it in the greater number of instances; the barrels which are forged in separate pieces being very few indeed, compared with those that are forged in a single piece, and are confiding of the fame quality throughout; it does not appear that the former are more liable to the fault in question than the latter are.

Some gunsmiths, says Monf. de Marolles, pretend, that a barrel, in order to throw its shot closely, ought to have a calibre narrower in the middle than at either breach or muzzle; whilst others, again, in fuit, that the calibre ought to contract gradually from the breech to the muzzle. With refpeft to these contrivances, however, we fhall only observe, that they are both admirably calculated to make the piece recoil, if not to burft it.

Of all these contrivances, not one appears calculated to answer the end for which it was propofed. The greater number of gunsmiths are of this opinion, and therefore very seldom practice them, unless to induce the whim of their customers. As far as our reafon and experience are sufficient for enabling us to determine upon the matter, we would reject all the expedients that have hitherto propofed, and give a decided preference to the barrels as they are usually made, that is, in such a manner as to be very solid and perfectly cylindrical throughout. Barrels of this kind have long supported their credit among the fbest sportsmen, whilst the pretended improvements have all experienced but a very temporary reputation, and are now almost entirely neglected. Would sportsmen only forbear to determine upon the merits or defects of their pieces, until they had given them a patient and impartial trial, by varying the quantity of powder and shot in different ways; we are inclined to think there would be fewer complaints made of the modern fowling-pieces. The chief source of error appears to be, that of overcharging. Every barrel, according to its calibre and weight, has a certain quantity of lead, and, without one of powder, which will be attended with greater certainty and effect than any others; and these must be determined by repeated trials. If we increase the quantity of shot above this, we lessen the force of discharge, and at the fame time increase the recoil: and, if we increase the charge of powder, that of the shot remaining the fame, we also increase the recoil; and, if we charge the powder much more than before. In every species of fire-arms, large charges of powder are found to disperse the shot very much, whilst with smaller charges are generally employed it is thrown more steadily and closely. If the object, therefore, which we are about to fire at, be at too great a distance for the shot to take effect, and it happens that we cannot approach nearer to it, we ought not to increase the quantity of powder with a view to the shot being thereby thrown farther, as, by doing the increase of the range will be very trifling, whilst the dispersion of the shot will be greatly increased.

The only expedient in this case is, to employ shot of a larger size; the quantity of it, and of the powder, being kept the fame as has already been found best suited to the piece.

We cannot venture to determine what degree of closeness in the shot will entitle any piece to the name of a good or a bad one; but would observe, that if a fowling-piece, charged with an ounce of No. 2, patent-shot, and a drachm of powder, throw fifty grains of shot, the charge is considered too small, and at forty, at the distance of fifty paces, we may consider it as very good, although these are only about one-third of the charge; and that the fame piece, continuing to be fired at the fame mark and distance, will not, in the mean of four or five successive discharges, throw thirty-five grains into the paper; in short, that attention is paid to finding the fatifactory quantity of powder and of shot, one piece will perform nearly as well as another.

OF RIFLE BARRELS.

It has been found that the flight of balls, both from cannon and small-arms, is liable to very considerable variations; and that the piece, notwithstanding it was firmly fixed, and fired with the fame weight of powder, sometimes threw the ball to the right, sometimes to the left, sometimes above, and at other times below, the mark. It has also been observed, that the degree of deflection increases in much greater proportion than the diftance of the object fired at; thus, at double the diftance, the deflection of the ball from the line on which the piece is pointed is considerably more than double, and at treble the diftance more than treble, what it was in the first. Mr. Robins secured a musket barrel upon a block of wood, and firing it with a ball, at a board of a foot square, fifty yards distance, found that it miffed the board only once in sixteen succeffive discharges; yet, when fired with a smaller charge, at the
the distance of seven hundred and sixty yards, it sometimes threw the ball one hundred yards to the right, and at other times one hundred to the left, of the line it was pointed in. The direction upwards and downwards was found equally uncertain, the ball sometimes bending to much downwards as to fall two hundred yards short of its range at other times. Yet the nicest examination could not discover that the barrel had started in the leaf from the position in which it was first fixed.

It is impossible to fit a ball so accurately to any plain piece, but that it will rub more against one side of the barrel than another, in its passage through it. Whatever side, therefore, it rubs against on its quitting the muzzle, it will acquire a whirling motion towards that side, and will be found to bend the line of its flight in the same direction, whether it be to the right or the left, upwards, downwards, or obliquely. This deflection from a straight line, arises from the resistance which the air gives to the flight of the bullet, it being greatest on that side where the whirling motion confpires with the progressive one, and least on that side where it is opposed to it; thus, if the ball in its passage out rubs against the left side of the barrel, it will whirl towards that side, and, the flight of the right side of the barrel therefore turn up against the air during its flight, the resistance of the air will become greatest on the right side, and the ball be forced away to the left, which was the direction it whirled in. If the axis, round which the ball whirls, prefered its position during the whole of the flight, the right side would be in the same direction from the one end of the track to the other. But, from accidents that are unavoidable, the axis of the whirl frequently changes its position several times during the flight; so that the ball, instead of bending its course uniformly in the same direction, often describes a track that is variously contorted. So great, however, is the friction of the air will become greater on the right side, and the ball be forced away to the left, which was the direction it whirled in. If the axis, round which the ball whirls, preferred its position during the whole of the flight, the right side would be in the same direction from the one end of the track to the other. But, from accidents that are unavoidable, the axis of the whirl frequently changes its position several times during the flight; so that the ball, instead of bending its course uniformly in the same direction, often describes a track that is variously contorted. So great, however, is the friction of the air that could serve to correct the variations that may occur during the flight.

The furrows, or channels, which are termed the rifles, vary in number according to the fancy of the workman, or that of the purchaser, but are never less than six, or more than twelve, in a common-sized piece. Their depth is equally subject to variation; but the breadth of the furrows and of the threads is generally the same. In some pieces, the spirals make a half turn, in others three-fourths, and in others, again, an entire revolution in the length of the barrel; an entire revolution, however, is the most common; though, from the great difference in the length of rifle barrels, there should be some standard aligned for the obliquity of the spiral. There is, without doubt, a certain obliquity of the spiral which would communicate a rotary motion to the ball, sufficient to correct any aberration in its flight; and this might be determined by comparing the effects of a number of pieces, that differed only in the obliquity of the rifles. Barrels, however, intended to be fired are previously bored and smoothed within, in the manner already described: they are, however, forged as much thicker than plain barrels as the depth of the rifles; for, although the threads of the spiral add to the weight of the barrel, they do not increase its strength in the leaf, with regard to the force exercised upon it by the powder.

These pieces are charged in various ways. In general, the ball, which is somewhat larger than the caliber before it was rifled, is driven down to the powder, by means of an iron rammer, struck with a mallet, whereby that zone of the ball which is in contact with the sides of the barrel, becomes indented all round, and is moulded to the form of the rifles. When the piece is fired, the projections of the ball which fill the rifles, being obliged to follow the sweep of the spiral, the ball thereby acquires a rotary motion upon an axis that corresponds with the line of its direction; so that the side of the bullet which lay foremost in the barrel, becomes foremost in the flight. By this means the resistence of the air is opposed directly to the bullet's progress; and, exerted more against one part than another of that side which moves foremost; and accordingly the bullet preserves the line of its direction with very great steadiness.

It appears, that neither the inventors of spiral rifle barrels, nor the persons who first used them, were at all acquainted with the principles upon which they produced their effects. Some were of opinion, that, owing to the ball not passing out so quickly as from a plain barrel, the powder was more completely inflamed, and thereby exerted a greater force upon it. Others, and these by far the greater number, thought that the ball, by combining the rotary with the progressive motion, did, as it were, bore the air; thereby flying much farther, and penetrating solid bodies to a greater depth, than when discharged from a plain barrel. But Mr. Robins afferts, that, as the bullet meets with a greater resistence in its passage through a rifed barrel, it remains through a plain one; so that, whether its velocity, or the obliquity of which it is thrown, is so great when fired from the former as when fired from the latter; and this difference will be very remarkable if the rifles be deep, and the ball fills them up completely; the friction, in that
that cafe, bearing a considerable proportion to the force of
the powder. For the same reason, he says that barrels
which are newly rifled, and consequently some-
what rough within, do not throw their balls so far as
they will be found to do after being ufed for some time,
and thereby rendered smoother; and, that the miffake
of those who supposed that rifle barrels threw their
ball to a greater distance than plain barrels did, arose
from their finding that, with the former, the could hit
in a mark at three or four times the distance they could
do with a plain barrel.

Besides the method of loading a rifle-barrel gun, by
driving down the ball with an iron rammer, there are
several others which we shall mention. In Germany,
youmefce charge them in the following manner: as
pieces of leather or turf, or turfs which are newly
rifled, and consequently some-
what rough within, do not throw their balls so far as
they will be found to do after being ufed for some time,
and thereby rendered smoother; and, that the miffake
of those who supposed that rifle barrels threw their
ball to a greater distance than plain barrels did, arose
from their finding that, with the former, the could hit
in a mark at three or four times the distance they could
do with a plain barrel.

The wood which is mofi commonly employed for the
stock, and which appears the beft for the purpofe, is
walnut.
between the flint and steel is too flight to produce the
bott have actually undergone a considerable degree of
red colour. When the strength of the springs, and the
being few and very small. The latter is known by the
collision, their surface exactly resembling the flag-
vitrification from the intensity of the heat excited by
spark, and, by submitting them to a microscope, de-
mands a considerable whizzing noise.

To explain these differences, it is necessary to ob-
serves, that the sparker, produced by the collision of flint
and steel, are particles of the metal driven off in a
sparking state, and which, falling among the pow-
d, in a precise, by flapping a gun or pistol
over a sheet of white paper, we may collect these
sparks, and, by submitting them to a microscope, de-
strate the truth of this remark. If the sparks are
very brilliant, and accompanied with a whizzing noise,
we shall find the particles collected on the paper to be
little globules of steel, which were not only melted,
but have actually undergone a considerable degree of
vitrification from the intensity of the heat excited by
the collision, their surface exactly resembling the flag
thrown out from an iron foundry. When the face of the
hammer is too hard, the particles which the flint
flings off are too large, and the powder is too slow
of the powder, in a precise manner, which means they
are confined entirely to the butt part. As the flint
in the hammer, no particular degree of hardness
be absorbed as a flint pad : different persons requiring dif-
ferent degrees, according to the length of their neck,
and to the manner in which they hold their head while
taking aim. This, therefore, as well as the length of
the butt, which depends partly upon the circumstances
just mentioned, but chiefly upon the length of the arm
y of which it is necessary fire. The face of the hammer,
also, may be too hard or too soft. The former is known
the cock is driven deep into the hammer at every
stroke, whilst the sparker are also few in number, and of a dull
red colour. When the strength of the springs, and the
hammer are in their full force, the sparker are numerous, brillian,
and accompanied with a considerable whizzing noise.

We think the conical form of the touch-hole a real
improvement; but do not approve of its widening so
much as it sometimes does in the patent-breech, as the
force of the fire of the pan is greatly increased by it. Gold pans
are of very little advantage; for, as the iron must be softened before
they can be applied, it is very liable to rust, and thus
defeat its connection with the gold; the tin, also, by
means of which the gold lining is fixed, is frequently
melted by the fire of the fuse being directed upon the
bottom of the pan, and the gold thereby detached from
the gold. We find that the fuse scarce ever blows out, and its
touch-hole is placed very low, and when, from its form or
width, the fire of the fuse is considerable. A great
improvement, however, has lately been made in the
manner of putting in the gold pans; they are now
dove-tailed in before the lock-plate is hardened, by
which means they seldom or ever blow out, and it is
found that they will stand better than any other
species of pan, provided that the lock is eased from the
touch-hole, or taken off when the barrel is taken out
of the stock. Still we are of opinion that the steel
pan will be found, with common care in cleaning it, to
last as long, and to answer every purpose as well, as
when lined with gold; but in an age of taste and ele-
ance, external ornaments seem not to be diffused with.

Much injury and inconvenience is apt to be expe-
rienced in wet weather, and in covert-shooting, by the
water finding its way into the pan, and converting the
gunpowder into a paste, which totally prevents it from
exploding. This, to be sure, only occasions a tempo-
rary diminution of our fire, but the case is totally dif-
different where an army is going into action, or is at-
tacked, in wet weather, or during a fall of snow, which
in spite of every care will inflame itself between the
barrel and the gunlock entering the pan, and thus
prevent the musket from firing, to the great disadvantage
of the troops, and in some cases, perhaps, fatal to the
views of an army; as was precisely the case with the
Russians under the czar Peter the Great, when attacked
during a heavy fall of snow, by Charles XII. king of
Sweden. To remedy this defect, Mr. John Proffer, of
Charing-cross, London, has recently produced a very
ingenious contrivance, consisting of the mere addition
of a small ward to the gun-lock, by means of which the
admission of water between the barrel and the pan
is utterly prevented, either by rain, snow, or exudation
from damp and foggy weather. This invention is
considered so valuable, that his majesty has granted letters
patent to Mr. Proffer, dated December 9, 1800, to fe-
cure the profits of it exclusively to himself and family,
for a term of fourteen years. As to the curvature, no particular degree

There are two other very recent improvements of the
gun-lock, which highly claim public attention and re-
gard. The first is a contrivance calculated to prevent
the fatal accidents which so often attend the unexpected
discharge of fire-arms; and which may be easily applied
to the gun-locks now in common use. It is confined
a principle, that when the gunlock is at full
cock, and the trigger pulled in the common manner, it
returns to the half cock only, unless, at the same time
that the trigger is pulled, the pressure of the thumb
be applied on a spring placed upon the butt or stock of
the gun; in which case it infallibly gives fire in the
usual manner. The intent of this invention is not only
to guard against the casualties which arise when fire-
arms are left in a careless manner loaded, but also from
the misfortunes which frequently happen from twigs of
trees or bushes catching the trigger when sportsmen are
pulling through coverts, or over hedges.—This im-
provement was made by Mr. John Webb, of Don-
ton-street, London, for which the sum of twenty gui-
neas was presented to him by the Society for the Encou-
ragement of the Arts, in 1802, and a complete model of
the gun-lock is preserved in the society's repository.

The annexed engraving correctly exhibits its con-
struction: Fig. 1, presents an interior view of the lock at
half cock. A, is the cock. B, the hammer. Fig. 2,
shows the same lock at half cock, with an outline of the
works: C, the main spring. D, the tumbler. E, the
large
large fear. F, the small fear. G, the fear spring.

Fig. 3, shows the lock when down. Fig. 4, shows the lock fixed in the gunlock: H, I, the small arm of the large fear. L, the small fear. M, the lever of the thumb-piece. N, the charge which holds the thumb-piece up, when not pressed upon by the thumb. When the gun is held cocked in the usual manner, ready to fire, and the trigger L is pulled by the finger, the thumb, being pressed at the same time on the piece K, raises, by means of the lever M, movable on a pin in its centre, the handle K of the small fear, and admits the cock to give fire in the common way; whereas, if only the trigger L be pulled, the lock drops at the half-cock C; all further motion being prevented by a notch in the small fear. A spring, N, screwed to the stock, returns the thumb-piece to its place, when the thumb is taken off. Fig. 5, shows, of its real size, the construction of the tumbler, large and small fears, the fear spring, and the manner in which they rise out of the bents of the tumbler.

Since the promulgation of the above invention of a spring to prevent the accidental discharge of guns, Mr. George Dodd, of Duke-street, Portland-place, London, has contrived a gunlock upon such fecure principles, as to preclude the possibility of its firing at half cock, either by accident, violence, or design. It possesses all the advantages of stop, spring, or bolt-locks, without their complicated construction. Nor has it one piece of machinery more than there is at present in the simplest of common gunlocks. Though these improved locks are perfectly secure at half cock, they will fire from whole cock, with much more certainty than a lock having a hair trigger, because less complex, and with equal fleetness.

A most valuable improvement in this gunlock is, that pulling the trigger, when the piece is at half-cock, renders it more and more secure, the reverie of this being the case with common gunlocks; for, the more powerfully the trigger is pulled when they are at half-cock, the more insecure they become. Another essential improvement is, that this gunlock cannot possibly catch and stop, at the position of half cock, when passing from the whole cock, and thus miss fire; a serious misfortune, to which gunlocks made on the common principle are so liable, that to prevent it, all the bents of the piece must be peculiar piece of machinery called a fly, or detachant.

These improved gunlocks are much less liable to be out of repair, as the bents are much deeper, and run through the solid metal directly towards the centre of the tumbler; unlike the usual bents, which are small, pointed, and the line of their depth near the circumference of the tumbler. Hence they are apt to be snapped off, or easily worn away, and fire from half-cock, as too frequently and fatally occurs. When these improved locks require cleaning, they are of so plain and simple a construction, as easily to be taken to pieces and put together by any soldier or sportsman. To put one of these gunlocks into an old block, it is merely necessary to make some trivial alterations in the excavation of the wood.

The sportsman, with one of these improved gunlocks to his bowling-piece, if the trigger should become entangled with a twig, may forcibly pull his piece away, altered, that in so doing, he increases his safety; but, if it be a common lock, he must turn back, and cautiously unload it, lest the piece should explode.

Among the many complicated contrivances to prevent pieces from going off at half cock, bolts have principally been used; but they are ill adapted to the purpose, exclusively of the additional expense; for few people, when alarmed, have the presence of mind first to unbolt the piece to render it fit for service, but they infantly attempt to cock. Disappointment adds to their confusion; and, ere they recollect their mistake, the game is gone. But this lock is ingeniously devised for safety and service, as it merely need be cocked for use, and half-cocked for security; both which can be performed with the least possible care and labour.

Of other lock that was ever before in use. Common gunlocks are also more easy to subject to the momentous falling of a false or delusive half-cock; for the noise of the fear rests on the point of the half-cock bent, which, as it causes no alteration in the external appearance, cannot be discovered, and its dangerous effects prevented. This very serious accident frequently occurs among recruits and unskilful gunners, from inattention to a very proper punctilio of military exercise; but it is utterly impossible that this should ever occur, with this lock by accident, or even by design. The improved gunlock is constructed on more mechanical principles, and is much simpler, and more easy to manufacture, than any other lock. Hence, there will be no increase of expense in execution, but a considerable decrease to the locks of rifles, bowing-pieces, pistols, &c.

These gunlocks are equally applicable to all descriptions of fire-arms, civil as well as military, and, in proof of their superior utility, Mr. Dodd states as follows:—In the Sump of August, 1805, I communicated the improvements of these improved gunlocks to the proper military officers, that no time might be lost at this critical juncture of national affairs, in rendering them of service to the country. They were therefore inspected and approved of by his royal highness the condominium in chief, who has publicly declared his opinion in very favorable terms; these improvements have also been adopted by generals Drummond, Lloyd, Fear, Blomefield, and others, at Woolwich; who, in their reports to the board of ordnance, entirely approve of these gunlocks; in consequence of which a quantity were immediately ordered for the army. Improvements in fire-arms are truly essential to the country, not only from its present military posture, but from the great quantity of muskets daily manufactured; government alone having annually had one hundred and fifty thousand small arms, on a mean of the last ten years, as I am informed by his majesty's principal armory officer at the Tower. —Added to this encouragement, Mr. Dodd was honoured with a silver medal, and a gratuity of ten guineas, from the Society of Arts and Manufactures, in 1804, for this valuable improvement.

In the engraving, the properties of this gunlock are correctly shown. Fig. 6, represents the exterior of this improved gunlock. Fig. 7, the interior of the same, with its works. Fig. 8, A, the tumbler; B, the fear; C, the fear spring; D, the trigger; all at the position of half-cock. Fig. 9, represents the same parts at whole-cock. Fig. 10, shows the position of A, B, C, and D, immediately after the piece is fired, and the finger withdrawn from the trigger. Fig. 11, represents the tumbler, fear, and fear spring, of the proper size. The particulars may be added to attend to in the construction of this gunlock are, that the centre of the fear B, should be placed in the circle, a, fig. 8, (the radius of this circle lies between the centre of the tumbler, and the extreme point of whole-cock bent;) and that the under side of the nose of the fear and the under side of half-cock bent, and the under side of whole-cock bent, must be figures of the circle 4, whole radius extends from the under side of the nose of the fear to the centre of the fears; by this means the fear will fit both the bents perfectly close, and hold very firmly together, without any tendency to alter their positions; neither will they need any assistance from the fear spring to keep them in their station. It is also necessary that the back of the fear be somewhat hollowed, to prevent the fear spring preting too hard at whole-cock.
GUN.

Improval Gunlocks.

London: Published at the Ad. Four, April 20th, 1802, by J. Welsh.
OF THE CHARGE, AND WADDING.

To find the charge that gives the longest range in fowling-pieces of different dimensions, must be allowed to be a discovery of infinite importance to every sportsman; and, as it seems to be an opinion pretty generally received, that the particular load, (not a measure estimated by any rules to be drawn from a comparison made between the proportions of the caliber and the length of the barrel,) with which it will shoot with greater certainty and effect, it cannot be doubted that he will make some experiments with his own barrels, in order to arrive at the end desired. Therefore we proceed, therefore, to lay down rules for the loading of fowling-pieces of different dimensions, we beg leave to engrat an excellent principle, in the practice of the artillery on this point, upon the practice of the shooting-science. It is asserted, that by using small charges at first, and increasing the quantity of powder by degrees, the ranges will increase to a certain point; after which, if the charge be augmented, they will progressively diminish; though the recoil will still continue in the ratio of the increase of the charge. This is a consequence that may be deduced from a variety of experiments, and is perfectly agreeable to the principles of mechanics: since it results from the range ought to be in the reciprocal ratio of the gun and the principles of mechanics. Since the recoil and the range are the two facts which the experiment, but it seems probable, that a wadding of the mould of the ball adapted to the piece will contain a great quantity of game, but then it is not melted by the explosion of the powder. Experience teaches, that nothing is better for wadding than soft brown paper; it combines suppleness with confluence, and moulds itself to the barrel: and it is further observables, that such wadding never falls to the ground in less than twelve or fifteen pieces from the muzzle of the piece. In countries where orchards abound, a very fine moss, or lichen, of a greenish-grey colour, is found adhering to the apple-trees, which is extremely proper for wadding, and which even poisons the extraordinary quantity of making the barrel less greasy and foul than paper, which contains a certain quantity of oil. Tow is very good for this purpose, and has also been extolled for the virtue of increasing the range and closeness of the shot of pieces; we have not made the experiment, but it seems probable, that a wadding of cork, adapted to the caliber of the piece, may produce a greater effect than a wadding of paper, in these respects; that, by stopping the barrel more hermetically, it prevents the elastic fluid, produced by the explosion of the powder, from escaping in any way, between the partition of wadding and the charge, preserves all its force to the mouth of the gun, and thereby renders the effect of the powder the greater. These principles have lately recommended the wadding of soft paper, cut out by punches of the exact caliber of the gun, to far exceed every other, and to which therefore we refer the reader.

We have now, however, to recommend a wadding of the cloth called learnought, or shepherd's-cloth, (which is very generally known,) and punched by the same instrument as mentioned for hat-wadding; but it must not be dyed, for the acid which is used to set the colour will ruin the inside of the barrel immediately in contact with it, and especially if the gun is laid by charged. Some sportsmen use it upon both the powder and shot; but, by experience we find, in proof of our former opinion on this matter, that it should only be laid upon the powder; for, when laid upon the shot, they are, in consequence, found to be more scattered in the discharge.
GUN-FOUNDER, f. [from the French gune, a gun; hence, a man who makes guns.] We have a trade in this that is called GUN-FOUNDER. It is a trade to manufacture cannon, mortars, howitzers, &c. See the article FOUNDER.

GUN-HARPOON, f. See the article HARPOON.

GUNNASIKOOG, a town of Sweden, in the province of Warmeland; thirty-four miles north-west of Carlshofd.

GU NARCHY, f. [γαρχις, Gr.] A female government. —I have always taken hope of change under a gunarchy. —Chesterfield. —This word does not seem rightly formed, it being usual to change the Greek γ into γο. —Major's Suppil.

GUNDAMIGLIA, a town of the island of Porto Rico, on the south coast.

GUNDELINGEN, a lordship of Germany, in Swabia, which takes its name from a castle so called: twenty-one miles west of Ulm.

GUNDELINGEN, a town of Germany, in the kingdom of Bavaria, and principality of Neuburg, situated on the Brenz, near the Donau, thirty-eight miles west of Neuburg, and nineteen north-east of Ulm. Lat. 48° 31'. N. lon. 9° 53'. E. Ferro.

GUNDIELA, f. [so named by Tournefort, in honour of Dr. Andrew Gundelchermer, who found it in his travels, in company with Tournefort, in the Levant.] In botany, a genus of the class Lycénææ, order polygynææ, natural order of urticaeae, (cinereophyllææ, Juf.) The generic characters are—Calyx: common fearely any, except the leaves surrounding the compound receptacle. Corolla: compound tubular, uniform; corollae hermaphrodite five, equal; proper one-petalled, club-shaped; border bell-shaped, five-echet, upright. Stamina: filaments five, capitulated, parallel, shorter than the corolla; stamens two, alternate. Pericarpium: none; but the seeds are totally imbedded and hid in the receptacle. Seeds: solitary, roundish, acuminate, crowned with an obtuse rim; the sides are abortive. Receptaculum: common conic, covered on every side with partial receptacles, divided by three-cleftéd chaffs; partially obively conic, quadrangular, truncate, with five little pits, one of which is in the centre, the others in the circumference, for the insertion of the five floficles. One central flower hermaphrodite, four marginal male.—Essential Character. Calyx fearely and abruptly cleft; corolla tubular, male and hermaphrodite; receptaculum cliavy; down none. Gundelgia Tournefortii, a facient species. It is a milky plant. Leaves alternate, prickly; floral leaves decurrent. Flowers terminating. Habit that of a thistle. Root perennial, running deep into the ground. Stalks seldom more than a foot and a half high. Under leaves are long, narrow, and serrate, the teeth ending in a spine; the other leaves are broader, irregularly flaked to the midrib, and armed at the points with sharp prickles. The stalks divide at top into several branches, which are armed with leaves of the same form, but narrower; each is terminated by a conical head of flowers, resembling those of Diplocaulis, surmounted at the base by a circle of long narrow prickly leaves. Few of the seeds ripen perfectly; and if rain happens when the plants are in flower, the germ perishes, which is the case with several other plants whose flowers are collected into heads. It is a native of the Levant; flowers in June, and the seeds ripen in August.

Propagation and Culture. This plant is propagated by seed, which should be sown the beginning of March, in a warm dry border of fresh but lean earth, in the place where the plants are designed to remain. When the plants come up, they must be carefully cleared from weeds; as they grow, large, they should be thinned, leaving the plants which are designed to remain about two feet asunder, that they may have room to spread. After this there is no other culture required, but to keep them clear from weeds; and if the frost should prove severe in winter, the plants should be covered with straw or peat-baulm to protect them; but this covering must be taken off in mild weather in two years, when they will produce their flowers, when they will make a fine appearance amongst other hardy plants in the pleasure-garden. They flower in May, and the plants lose their leaves and flowers in autumn, but their roots will abide many years.

GUNDELSHEIM, a town of Germany, in Swabia, situated on the Neckar: thirty miles east of Hildelberg.

GUNDELSBORG, a town of Germany, in the archduchy of Austria; six miles north of Sonneberg, and twenty-six north-west of Vienna.

GUNDLING, (Nicholas-Jerom), a lawyer and historian, born in 1671, at a town near Nurkemberg, where his father was a minister. He studied at Altdorf under John Fabricius, and afterwards at Jenæ and Leipfie. In 1698 he attended some young men of rank at the university of Halle, where he changed his pursuits from theology to law, in which he graduated in 1703. He succeeded there to the professorship of eloquence and natural law, and was made counsellor to the confidory of the duchy of Magdeburg, and after being privy-counsellor, He was rector of the university of Halle at his death, in 1729. His writings are, 1. New Dialogues. 2. Plan of a Course of Literary History. 3. Historia Philosophica Naturalis. 4. Otia; or, a Collection of Discourses on Physical, Moral, Political, and Historifical Topics, 3 vols. 8vo. 5. De State Opgignorati Territorii. 6. Status Naturáti Hobbéi, etc. 7. De Statu Regni Germanici ab anno 118 in. 8. Commentatio de Henrico Ausci. 9. Via ad Veritatem. 10. Gundingiana. He had also a considerable share in the Observationes Holsteiniae.

GUNOROEASKAI'A, a town of Russia, in the country of the Cossacks, on the Donetz: 122 miles north of Azoph.

GUNDUCK, a river of Asia, which rises in the country of Napaul, and runs into the Ganges, opposite Patna, in the country of Bahar.

GUNDI, [Hebrew.] A man's name.

GUNIER, f. An officer appointed for the management of cannon, or one skilled in the science of gunnery.

GUNN, f. [from Linneus, in honour of Janus Fregulus Gunnerus, bishop of Dronthom in Norway, the subject of the next article.] In botany, a genus of the class Fynsææ, order dianthúraceæ, natural order of urticaeæ. —Juf. The generic characters are—Calyx: ament verticillated; scales one-leaved, one-flowered, staccatus, the length of the flower, permanent; perianthium none, except the crust of the seed, which has two teeth. Corolla: none. Stamina: filaments two, very short, opposite, sitting on the sides of the germ on the outside of the teeth; anthera oblong. Pistillum: germ ovate, with two teeth on the tip; dyles two, short, subulate, between the teeth of the germ; stigmas simple. Pericarpium: none. Seed: single, ovate, the bark formed from the crust of the perianthium.—Essential Character. Ament with one-flowered scales; calyx and corolla none; germ two-toothed; dyles two; seed one.

Gunnera perpendiculata, or marsh-marygold-leaved gunnera, the only species known. Leaves radical, cordate, obtuse, smooth, veined, repand, tooth-crenate, with the petioles scarcely pubescent. Scape two feet high. Ament terminating, long; compound, the subumbils scattered, simple, distinct; bractes lanceolate, short. Fllosules naked.
naked, Native of the Cape of Good Hope. Introducck in 1765 by Mr. William Malcolm.

GUNNERUS (John Erneste), a Norwegian bishop, born in 1718, at Christiania, in Norway. His father was Erazmus Gunneus, town-physician of that place, and his mother, Ann Gerhard, a native of Scotland. He received the early part of his education under private tutors, and in 1739, at which period he had the misfortune to lose his father, was placed at the public school of Christiania. Here he remained till 1737, and then proceeded to Copenhagen, where he pursued his studies at the university with such success, that he soon distinguished himself by his knowledge of Greek and Latin, and was appointed to the instruction of youth, and applied to the study of philosophy and theology. In 1742, he repaired to the university of Halle, where he studied theology, philosophy, and the mathematics. He afterwards accompanied two young gentlemen to Jena; and in 1754 was invited to be extraordinary professor of theology at Copenhagen, preacher at Hertufholm, and lecturer on theology and the Hebrew language in the public school of that place. Soon after he was ordained priest at Copenhagen, and in 1758 was appointed by Frederic V. bishop of Dronthelm. Being fond of the sciences, and enabled by his situation to gratify his desire of discharging useful services to his country, he founded the society of Dronthelm. Being a member of the academies of Copenhagen and Stockholm, as well as of other learned societies, and dead at Christiania in 1773. Of his papers in the Transactions of which he published, in 1766, Flora Norwegica, containing 314 species of plants, with some useful productions. He published, in 1766, Flora Norwegica, 

Pars I. folio, containing 314 species of plants, with some new fuci. To each are added the medical and economical uses. Some figures are given. The bishop's other works were on the theological and philosophical tracts in Latin, and some sermons in the Danish tongue.

GUNNERY. The science of artillery; the art of managing cannon by the laws of projectiles. The ancients, without using gunpowder, had machines which were capable of discharging stones, darts, and arrows, with surprising force. They were impelled chiefly by the weight of the machines, or of the shot, and though less orderly and accurate, were capable of doing great damage. The machines required a great number of men to work them; for which reason, the explosion of gunpowder, as acting instantaneously, and seemingly with irresistible force, seemed to be a most proper succedaneum for all the powers by which these ancient military engines were actuated. See correct figures of these engines, and examples of their use, under the article Artillery, vol. ii. p. 220-234, and the correspondent engravings.

Since the general introduction of artillery into the art of war, which took place in the fifteenth century, very considerable improvements have been made in the science of gunnery. The large and unwieldy cannon which were then so much prized, as carrying balls of upwards of sixty pounds weight, have been totally laid aside, the same ends being now accomplished with greater facility by smaller pieces. Thus the battering cannon now chiefly approved are those formerly called demi-cannons, carrying a ball of twenty-four pounds weight; it being found by experience, that their fire, though less violent than that of larger pieces, is yet sufficiently adapted to the strength of the usual profiles of fortifications: besides that the facility of their carriage and management, and the ammunition they spare, give them great advantages beyond the huge cannons formerly employed for making breaches. The method also of making a breach, by first cutting off the whole wall as low as possible before its upper part is attempted to be beat down, seems also to be a considerable modern improvement in the practical part of gunnery. But the most considerable improvement in the practice is the method of firing with small quantities of powder, and elevating the piece but a little, so that the bullet may just pass over the parapet of the enemy, and drop into their works. By this means the bullet, coming to the ground at a small angle, with a small velocity, does not bury itself, but bounds or rolls along in the direction in which it was fired, carrying all before it. This method was first practised by M. Vauban, at the siege of Aeth, in 1692; and a similar method was successfully adopted with bomb-sheils by the late king of Prussia, at the battle of Kobach, in 1757. He had several small machines, mounted, and mounted on travelling carriages, which were fired obliquely on the enemy's lines, and among their force, the being charged with only eight ounces of powder, and elevated at one degree and a quarter, did great execution: for these shells, rolling along the lines with burning fuses, made the front of the enemy not wait for their bursting. But the use of gunnery in a rude way was long practiced before any theory of projectiles was formed. The Italians were the first who made any attempts at the formation of a theory, which they did about the beginning of the sixteenth century; and amongst them it seems the first who wrote professedly on the subject was Nicholas Tartalia, of Brescia, the fame author who had so great a share in the invention of the rules for cubic equations. In 1537 he published at Venice his Nova Scientia, and in 1546 his Quaestiones in Inventionem dierfer; in both which he treats professedly on the motion and flight of cannon balls, as well as in another work, translated into English with additions by Cyprian Lucas, under the title of "Colloquies concerning the Art of Shooting in great and small Pieces of Artillery," published at London in 1583. He discovered that the greatest range of a shot was, when discharged, at an elevation of 45°; and he applied, contrary to the opinion of his contemporaries, that no part of the path described by a ball is a right line; although the curvature in the first part of its flight is so small, that it need not be attended to. He compared it to the surface of the sea; which, though it appears to be a plane, is nevertheless incurvated round the centre of the earth. It is said that he invented the gunner's quadrant, for fixing a piece of ordnance at any point or degree of the horizon; and that he laid down the rules of acquiring any practical knowledge by experiment. He yet gave many guesses at the time of many untried methods. The philosophers of those times took part in the questions arising upon this subject; and many disputes on the flight of balls took place, particularly in Italy, which continued till the time of Galileo, and probably gave rise to his celebrated Dialogues on Motion. These were not published till 1638, and in the interval there were many theories of the motion of military projectiles, as well as many tables of their comparative ranges, though for the most part fallacious, and inconsistent with the true motion of these bodies. Yet it is remarkable how soon, however divergent the centers of few of those who were intrusted with the care of artillery thought it worth while to bring their theories to the test of experiment. Mr. Robins informs us, in the preface to his New Principles of Gunnery, that he had met with no more than four authors who had treated experimentally on this subject. The first of these is Col- lado, in 1644, who has given the ranges of a falconet, carrying a three-pound shot, to every point of the gunner's quadrant, each point being the 12th part, or seven degrees and a half. But from his numbers it is manifest that the piece was not charged with its usual allotment of powder. The result of his trials fews the ranges at the point-blank, and the several points of elevation, as follow.

### Points:
The next series of experiments were given by William Bourne, in 1643, in his Art of Shooting in Great Ordinance. His elevations were not regulated by the points of the gunner's quadrant, but by degrees; and he gives the proportions between the ranges at different elevations, and the extent of the point-blank shot, thus: if the extent of the point-blank shot be represented by 1, then the proportions of the ranges at several elevations will be as follows:

which greatest random, he says, in a calm day, is at 45° elevation; but according to the strength of the wind, and as its favour or opposes the flight of the shot, the range may be from 45° to 36°. He does not say with what piece he made his trials; though from his proportion it seems to have been a small one. This, however, ought to have been mentioned, as the relation between the extent of different ranges varies extremely according to the velocity and density of the bullet.

After him, Eldred and Anderfon, both Englishmen, published treatises on this subject. The former of these was many years gunner of Dover-castle, where most of his experiments were made, the earliest of which are dated in 1611, though his book was not published till 1646, and is intituled The Gunner's Glafs. His principles were sufficiently simple, and within certain limits very near the truth, though they were not rigorously so. He has given the actual ranges of different pieces of artillery at small elevations, all under ten degrees. His experiments are numerous, and appear to be made with great care and caution; and he has honestly set down some, which were not reconcileable to his method: upon the whole he seems to have taken more pains, and to have had a judicious knowledge of the subject, than is to be found among his practical brethren.

Galileo printed his Dialogues on Motion in 1646. In these he pointed out the general laws oberved by nature in the production and composition of motion, and was the first who described the action and effects of gravity on falling bodies: on these principles he determined, that the flight of a cannon-ball, or of any other projectile, would be in the curve of a parabola, unless so far as it should be diverted from that track by the resistence of the air. He also proposed the means of examining the inequalities which arise from thence, and of discovering what sensible effects that resistence would produce in the motion of a bullet at some given distance from the piece. Yet notwithstanding these valuable hints of Galileo, it seems that those who came after him never imagined that it was necessary to consider how far the operations of gunnery were affected by this resistence. Instead of this, they boldly asserted, without making the experiment, that no great variation in the flight of the shot might be ascribed to their true cause, which is the great resistence of the air; and the effects of the resistence would be so triflingly sensible that it was not worth while to consider them. Thus Robert Anderfon, in his Genuine Use and Effects of the Gunne, published 1655, and again in his book To hit a Mark, in 1690, relates a great many experiments; but, proceeding on the principles of Galileo, he strenuously afferts that the flight of all bullets is in the curve of a parabola; undertaking to answer all objections that could be brought to the contrary. The same thing was also undertaken by Blondel, in his Art de jeter les Bombes, published in 1683, where, after long discussion, he concludes, that the variations from the air's resistence are so slight as not to deserve any notice. The same subject was treated of in the Philof. Trans. No. 216, p. 63, by Dr. Halley; who also, swayed by the great disproportion between the density of the air and that of iron or lead, thought it reasonable to believe that the opposition of the air to large metal shot is far more sensible; although in small and light shot he owns that it requires to be accounted for.

But though this hypothesis went on smoothly in speculation, yet Anderfon, who made a great number of trials, found it impossible to support it without some modification. For though it does not appear that he ever examined the comparative ranges of either cannon or musket-shot when fired with their usual velocities, yet his experiments on the ranges of shells thrown with velocities that were but small in comparison of those above-mentioned, convinced him that their whole track was not parabolical. But instead of making the proper inferences from hence, and concluding that the resistence of the air was of considerable efficacy, he framed a new hypothesis; which was, that the shell or ball at its first discharge flew to a certain distance in a right line, from the end of which line only it began to describe a parabola: and this right line, which he calls the line of the impulse of the fire, he supposes is the same for all elevations. So that, by altering a proper length to this line of impulse, it was always in his power to reconcile any two shots made at any two different angles; though the same method could not succeed with three shots; nor indeed does he ever inform us of the event of his experiments when three ranges were tried at one time.

But after the publication of Newton's Principia, it might have been expected, that the defects of the theory would be ascribed to their true cause, which is the great resistence of the air to such swift motions; as in that work he particularly considered the subject of such motions, and related the result of experiments, made on slow motions at least; by which it appeared, that in such motions the resistence increases as the square of the velocities, and he even hints a supposition that it will increase above that law in swifter motions, as is now known to be the case. So far, however, were those who treated this subject scientifically from making a proper allowance for the resistence of the atmosphere; that they still neglected it; or rather opposed it; and their theories of disturbed mo'd egregiously from the truth. Huygens alone seems to have attended to this principle: for in 1690 he published a treatise on gravity, in which he gave an account of some experiments tending to prove that the track of all projectiles, moving with very swift motions, was widely different from that of a parabola. The other mathematicians generally acquiesced in the sufficiency of Galileo's doctrine, and accordingly very erroneous calculations concerning the ranges of cannon were given. Nor was any farther notice taken of these errors till the year 1716, at which time M. Reffons, a French officer of artillery, of great merit and experience, gave in a memoir to the royal academy, importing that, although it was asserted that theory and practice did constitute the perfection of every art; yet experience had taught him that theory was of very little service in the use of mortars; that the works of M. Blondel
had justly enough described the several parabolic lines, according to the different degrees of the elevation of the pieces; and a practice had convinced him there was no theory in the effect of gunpowder; for having endeavored, with the greatest precision, to point a mortar according to these calculations, he had never been able to establish any solid foundation upon them. One instance only occurs in which D. Bernouilli applies the doctrine of a parabolic trajectory in order to establish the theory of the effect of gunpowder. In the computation of the flight of balls, and the theory and practice of Gunnery, in which he treated particularly not only according to the different degrees of the elevation of the gunnery, but also of the force and properties of different guns, and almost every thing else relating to the flight of balls, and the theory and practice of gunnery.

The first thing considered by Mr. Robins, and which is indeed the foundation of military projectiles, is the explosive force of gunpowder. M. de la Hire, in the History of the Academy of Sciences for 1702, supposed that this force may be owing to the increased elaticity of the air contained in and between the grains, in consequence of the heat produced at the time of the explosion: a cause not adequate to the 200th part of the effect. On the other hand, Mr. Robins determined, by irrepeable experiments, that this force was owing to an elatic fluid, similar to our atmosphere, existing in the powder in an extremely condensed state, which, being suddenly freed from the powder by the combustion, expanded with an amazing force, and violently impelled the ball, or whatever might oppose its expansion.

The intensity of this force of exploded gunpowder was ascertained in different ways, after the example of Mr. Hawkfbee, related in the Philos. Trans. No. 295, and in his Physico-Mechan. Exper. p. 81. One of these is by firing the powder in the air thus: A small quantity of the powder is placed in the upper part of a glass tube, and the lower part of the tube is immersed in water, the water being made to rise so near the top, that only a small portion of air is left in that part where the powder is placed: then in this situation the communication between the upper part of the tube and the external air being closed, the powder is fired by means of a burning lens, or otherwise; the water descends upon the explosion, and stands lower in the tube than before, by a space proportioned to the quantity of powder fired.

Another way was by firing the powder in vacuo, viz. in an exhausted receiver, by dropping the grains of powder upon a hot iron included in the receiver. By this means a permanent elatic fluid was generated from the fired gunpowder, and the quantity of it was always in proportion to the quantity of powder that was used, as was found by the proportional linking of the mercu- rial gauge annexed to the air-pump. The result of these experiments was, that the weight of the elastic air thus generated, was equal to the compound mass of the gunpowder which yielded it; and that its bulk, when cold, and after the rarefaction common atmospheric air, was about 240 times the bulk of the powder; and consequently in the same proportion would the fluid at first, if it were cold, exceed the force or elaticity of the atmosphere. But as Mr. Robins found, by another ingenious experiment, that air heated to the extreme degree of the white heat of iron has its elaticity quadrupled; he thence inferred that the force of the elastic air generated as above, at the moment of the explosion, is at least four times 240, or 960, or in round numbers about 1000 times as strong as the elaticity or pressure of the atmosphere on the same space.

Having thus determined the force of the gunpowder, or the intensity of the agent by which the projectile is to be urged, Mr. Robins next proceeds to determine the effects it will produce, or the velocity with which it will impel a shot of a given weight from a piece of ordnance of given dimensions; which is a problem strictly limited, and perfectly solvable by mathematical rules, and is in general this: Given the first force, and the law of its variation, to determine the velocity with which it will impel a given body in passing through a given space, which is the length of the bore of the gun.

In the solution of this problem, Mr. Robins assumes these two postulates, viz. 1. That the action of the powder on the ball ceases as soon as the ball is out of the piece; and 2d, That all the powder of the charge is fired and converted into elatic fluid before the ball is sensibly moved from its place: assumptions which, for good reasons, are found to be in many cases very near the truth. It is to be noted also, that the law by which the force of the elastic fluid varies is this, viz. that its intensity is directly as its density, or reciprocally proportional to the space it occupies, being so much the stronger as the space is less; a principle well known, and common to all elastic fluids. Upon these principles Mr. Robins resolves this problem, by means of the 39th prop. of Newton's Principia, in a direct way, and the result is equivalent to this theorem, when the quantities are expressed by algebraic symbols; viz. the velocity of the ball

\[ v = \frac{27130}{\frac{10a}{d} \times \log \frac{b}{a}} - \frac{27130}{\frac{2a}{d} \times \log \frac{b}{a}} \]

where \(v\) is the velocity of the ball,

\(a\) the length of the charge of powder,

\(b\) the whole length of the bore,

\(c\) the spee. grav. of the ball or wt. of a cubic foot of the same matter in ounces,

\(d\) the diam. of the bore,

\(a\) the wt. of the ball in ounces.

For example, suppose \(a = 2\) inches, \(b = 45\) inches, \(c = 1135\) oz. for a ball of lead, and \(d = \frac{1}{4}\) inch; then \(v = 27130\left(\frac{7}{24} \times \log \frac{120}{7}\right) = 1674\) feet per second, the velocity of the ball.

Or, if the wt. of the ball be \(a = 1\frac{3}{4}\) oz. = \(\frac{1}{8}\) oz.

Then \(v = 100\left(\frac{1115 \times 189}{293} \times \log \frac{120}{7}\right) = 1674\) feet, as before.

"Having in this proposition (says Mr. Robins) shewn how the velocity which any ball acquires from the force of powder, may be computed upon the principles of the theory laid down in the preceding propositions, we shall next shew, that the actual velocities with which balls of different magnitudes are impelled from different pieces, with different quantities of powder, are really the same with the velocities alligned by these computations; and consequently that this theory of the force of powder, here delivered, does unquestionably ascertain the true action and influence of this enormous power. But in order to compare the velocities communicated to balls by the explosion with the velocities resulting from the theory by computation, it is necessary that the actual velocities with which balls move, should be capable of being discovered, which is impossible to be done by any methods yet made public. The only means hitherto practiced by others for that purpose, have been either by observing the time of the flight of the shot through a given space, or by measuring the range of the shot at a given elevation, and thence computing on the parabolic hypothesis what velocity would produce this range. The first method labours under this insurmountable difficulty, that the velocities of these bodies are often fo..."
and consequently the time observed is so short, that an imperceptible error in that time may occasion an error in the velocity thus found, of $2, 3, 4, 5, \text{or} 600$, feet in a second. The other method is so fallacious, by reason of the imprecision of the air, (to which inequality the first is also liable,) that the velocities thus affigned may not be perhaps the tenth part of the actual velocities sought. To remedy these inconveniences, I have invented a new method of finding the real velocities of balls of all kinds; and this to such a degree of exactness (which may be augmented too at pleasure,) that the velocities by this method, of 2, 3, 4, 5, or 600, feet in one second, the error in the estimation of it need never amount to its tenth part; and this without any extraordinary nicety in the construction of the machine.

Mr. Robins then proceeds to describe the machine by which he measures the velocities of the balls, which machine is simply a pendulous block of wood, suspended freely by a horizontal axis, against which block are to be fired the balls whose velocities are to be determined. "This instrument thus fitted, if the weight of the pendulum be known, and likewise the respective distances of its centre of gravity and of its centre of oscillation from its axis of suspension, it will thence be known what motion will be communicated to the pendulum by the percussion of a body of a known weight moving with a known degree of velocity, and striking it in a given point; that is, if the pendulum be supposed at rest before the percussion, it will be known what vibration it ought to make in consequence of such a determined blow; and, on the contrary, if the pendulum, being at rest, is struck by a body of a known weight, and the vibration which the pendulum makes after the blow is known, the velocity of the striking body may thence be determined. Hence then, if a bullet of a known weight strikes the pendulum, and the vibration which the pendulum makes in consequence of the stroke be ascertained, the velocity with which the ball moved is thence to be known."

Mr. Robins next explains his method of computing velocities from experiments with this machine; but which is rather perplexed, as well as the rules of Euler and Antoni, who followed him in this investigation. A much plainer rule is given in Dr. Hutton's Tracts, vol. i. p. 119; where such experiments are explained at full length, and this rule is expressed by either of the two following formulas:

\[ v = \frac{r \sin \theta}{\sin \theta - \sin \beta} \]
\[ \theta = \frac{g \sin \beta}{b \sin \beta} \]

where $v$ denotes the velocity of the ball when it strikes the pendulum, $p$ the weight of the pendulum, $\beta$ the weight of the ball, $r$ the chord of the arc described by the vibration to the radius $r$, $\beta$ the distance below the axis of motion to the centre of gravity, $\beta$ the distance to the centre of oscillation, $i$ the distance to the point of impact, $n$ the number of oscillations the pendulum will perform in one minute, when made to oscillate in small arcs. The latter of these two theorems is much the easiest, both for being deduced from the former, and because the value of the radical $\sqrt{2}$, in the former, is to be first computed from the number $n$, or number of oscillations the pendulum is observed to make.

With such machines Mr. Robins made a great number of experiments, with musket-barrels of different lengths, with balls of various weights, and with different charges or quantities of powder. He has set down the results of sixty-one of these experiments, which nearly agree with the corresponding velocities as computed by his theory of the force of powder, and which therefore establish that theory on a sure foundation.

From these experiments, as well as from the preceding theory, many important conclusions were deduced by Mr. Robins; and indeed by means of these it is obvious that every thing may be determined relative both to the true theory of projectiles, and to practical gunnery: for, by firing a piece of ordnance charged in a similar manner against such a ballistic pendulum from different distances, the weight of the ball with which such spaces of air will be found, and consequently the resistance of the air, the only circumstance that was wanting to complete the theory of military projectiles; and of this kind Dr. Hutton professes to have made a great number of experiments with cannon-balls, and thereby obtained the whole series of resistances to such a ball when moving with every degree of velocity, from 0 up to 3000 feet per second of time. In the structure of artillery, they may likewise be of the greatest use: for hence may be determined the best lengths of guns; the proportions of the shot and powder to the several lengths; the thickness of a piece, so as it may be able to confine, without bursting, any given charge of powder; as also the effect of wads, chambers, placing of the vent, ramming the powder, &c. For the many other curious circumstances relating to this subject, and the various other improvements in the theory and practice of gunnery made by Mr. Robins, consult the first volume of his Tracts, collected and published by Dr. Wilson, in 1776, whereample information may be found.

Soon after the first publication of Robins's Principles of Gunnerly, in 1742, the learned in several other nations, treading in his steps, repeated and farther extended the same subject, sometimes varying and enlarging the machinery; particularly Euler in Germany, D'Antoni in Italy, and D'Arcy and Le Roy in France. But most of these, like Mr. Robins, with small fire-arms only, such as muskets and fulls. "But, says Dr. Hutton, (Phil. Dict. p. 556.) in the year 1755, in conjunction with several able officers of the royal artillery, and other ingenious gentlemen, I undertook a course of experiments with the ballistic pendulum, in which we ventured to extend the machinery to cannon-shot of one, two, and three, pounds weight. An account of these experiments was published in the Phil. Trans. for 1778, and for which the Royal Society honoured me with the prize of the gold medal. These were the only experiments that I know of which had been made with cannon-balls for this purpose, although the conclusions to be deduced from such are of the greatest importance to the parts of natural philosophy which are dependent on the effects of fired gunpowder; nor do I know of any other practical method of ascertaining the initial velocities within any tolerable degree of the truth. The knowledge of this velocity is of the utmost consequence in gunnery; by means of it, together with the law of the resistance of the medium, every thing is determined relative to the flight of a shot, and the effect of all sorts of gunshot; wherefore the most excellent method of trying the strength of different sorts of powder, it gives us the law relative to the different quantities of powder, to the different weights of shot, and to the different lengths and sizes of guns. Besides these, there does not seem to be any thing wanting to answer any inquiry that can be made concerning the flight of a shot, and the effect of all sorts of gunshot, according to the resistance of the medium. In these experiments the weights of the pendulums employed were from 300 to near 600 pounds. In that paper is described the method of constructing the machinery, of finding the centres of gravity and oscillation of the pendulum, and of making the experiments, which are all set down in the form of a journal, with all the minute and concomitant circumstances; as also the investigation of the new and easy rule, set down just above, for computing the velocity of the ball from the experiments. The charges of powder were varied from two to eight ounces, and the shot from one to near three pounds. And from the whole were clearly deduced the principal inferences were:

"1. That gunpowder fires almost instantaneously.

2. That
2. That the velocities communicated to balls or shot, of the same weight, by different quantities of powder, are nearly in the subduplicate ratio of those quantities: a small variation, in effect, taking place when the quantity of powder is augmented, and when the charges of different weights are employed, with the same quantity of powder, the velocities communicated to them are nearly in the reciprocal subduplicate ratio of their weights. But important as this saving increased in the ratio of the square root of the weight, may be, it seems to be still exceeded by that of the article considered as both taking place, it is evident that about one-third or more of the shot. 6. It would also be an improvement to diminish the windage; for thus the momentum of a shot, when fired with the same weight of powder, would be increased in the ratio of the square root of the weight of the shot. 5. It would therefore be a great improvement in artillery, to make use of shot of a long form, or of heavier matter; for thus the momentum of a shot, when fired with the same weight of powder, would be increased in the ratio of the square root of the weights of the shot, nearly. But it seems to be still exceeded by that of the article of the guns; for thus a small gun may be made to have the effect and execution of another of two or three times its size in the present mode, by discharging a shot of two or three times the weight of its natural ball or round shot. And thus a small ship might discharge shot as heavy as that of the greatest now made use of.

Finally, as the above experiments exhibit the regulations with regard to the weights of powder and balls, when fired from the same piece of ordnance, &c. by making similar experiments with a gun, varied in its length, by cutting off from it a certain part before each course of experiments, the effects and general rules for the different lengths of guns may be certainly determined by them. In short, the principles on which these experiments were made are so fruitful in consequences, that in conjunction with the effects resulting from the resistance of the medium, they seem to be sufficient for answering all the enquiries of the speculative philosopher, as well as those of the practical artillerist.

In 1786 was published the first volume of Dr. Hutton's Traicts, in which is detailed, at great length, another extensive course of experiments which were carried on at Woolwich in the years 1773, 1774, and 1775, by order of the late duke of Richmond, master-general of the ordnance. The objects of this new series were very numerous, but the principal of them were the following:

1. That the velocities with which balls are projected by equal charges of powder, from pieces of the same weight and calibre, but of different lengths. 2. That the velocities with different charges of powder, the weight and length of the gun being the same. 3. The greatest velocity of the greatest length of gun, being the same. 4. The effect of varying the weight of the piece; every thing else being the same. 5. The penetration of balls into blocks of wood. 6. The ranges and times of flight of balls; to compare them with their initial velocities for determining the resistance of the medium. 7. The effect of wads; of different degrees of ramming; of different degrees of windage; of different positions of the vent; of chambers, and trunnions; and every other circumstance necessary to be known for the improvement of artillery.

All these objects were obtained in a very perfect and accurate manner, the logarithms of the velocities, instead of being the charges themselves, or, which is the same thing, the square of the velocity.

9. These, and most other experiments, show that balls are greatly deflected from the direction they are projected
by the ball alone, being equal to the momentum of the ball, this becomes known; and therefore being divided by the known weight of the ball, the quotient will be the velocity. In the experiments however contained in Dr. Hutton's Tracts of gunpowder and projectiles, of whose facts are compared together, and the inaccuracy of that rule is shown.

Having in the 9th prop. compared together a number of computed and experienced velocities of balls, to verify his theory; Mr. Robins, in the 10th prop. aligns the changes in the force of powder, which arise from the different states of the atmosphere, as to heat and moisture, both which he finds have some effect on it, but especially the latter. In prop. 11. he investigates the velocity which the flame of gunpowder acquires by expanding itself, supposing it fired in a given piece of artillery, without either a bullet or any other body before it. This velocity he finds is upwards of 7000 feet per second. But the celebrated Euler, in his commentary on this part of Mr. Robins's book, thinks it may be still much greater; and in this proposition too it is, that Mr. Robins declares his opinion above alluded to, viz. that the effect of the powder upon the recoil of the gun is the same in all cases, whether fired with a bullet in it or not; a point sufficiently established by the manner in which the flame of powder impels a ball which is laid at a considerable distance from the charge; showing here that the sudden accumulation and density of the fluid against the ball is the reason that the ball is so often burst in those cases.

Mr. Robins, in eight other propositions, treats of the resistance of the air, and of the track described by the flight of shot and shells. And of these, prop. 1. describes the general principles of the resistance of fluids to solid bodies moving in them. Here Mr. Robins distinguishes between continuous and compressed fluids, which immediately rush into the space quitted by a body moving in them, and whose parts yield to the impulsion of the body without condensing and accumulating before it; and such fluids as are imperfectly compressed, as in the case of our atmosphere, which condenes more and more before the ball as this moves quicker, and also prefcribes the laws of motion by which it follows it always with a limited velocity, as in the case of the atmosphere, which condenes more and more before the ball as this moves quicker.

Sir Benjamin Thompson (now count Rumford) instituted a very considerable course of experiments of the fame kind as those of Mr. Robins, with musket balls, which were published in the Philosophical Transactions, vol. 74, for the year 1781. In these experiments, the conclusions of Mr. Robins are for the most part confirmed. This gentleman also purifies a hint thrown out by Mr. Robins, relative to the determining the velocity of a ball from the recoil of the pendulous gun itself. Mr. Robins, in prop. 11. remarks, that the effect of the exploded powder upon the recoil of the gun, is the same whether the gun is charged with a ball or without one; and that the chord, or velocity, of recoil with the powder alone, being full divided, to a certain extent, on the recoil which is caused by the weight of both powder and ball, leaves the velocity which is due to the ball alone. From thence Sir Benjamin observes, that the inference is obvious, viz. that the momentum thus communicated to the gun
frequently driven to the right or left of that direction by the action of some other force: and in the 8th proposition, he pretends to show that the depths of penetration of balls into firm substances are as the squares of the velocities. But this is a mistake; for neither does it appear that his trials were sufficiently numerous or various, nor were his small leaden balls fit for this purpose; and it has appeared, from a number of trials with iron cannon-balls, that the penetrations are in a much lower proportion, and that the retarding force of wood is not uniform. See Dr. Hutton's Tracts.

Mr. Robins professes the subject of the resistance of the air much farther, and lays down rules for computing ranges made in the air. But these must be far from accurate, as they are founded on the two following principles, which are known, from numerous experiments, to be erroneous: viz. 1st, "That till the velocity of the projectile surpasses that of 1000 feet in a second, the resistance may be effected to be in the duplicate proportion of the velocity. 2d. That if the velocity be greater than that of 1000 feet in a second, then the absolute quantity of that resistance in these greater velocities will be near three times as great as it should be by a comparison with the smaller velocities." For, instead of leaping at once from the law of the square of the velocities, and ever after being about three times as much, experiments prove that the increase of the resistance above the law of the square of the velocity, takes place at first in the smallest motions, and increases gradually more and more, to a certain point, but never rises so high as to be three times that quantity, after which it decreases again. To render this evident, Dr. Hutton has inferred the following table of the actual quantities of resistances, which are deduced from accurate experiments, and which show also the nature of the law of the variations, by means of the columns of differences annexed; reserving the detail of the experiments themselves to another occasion. These resistances are, upon a ball 1.965 inches diameter in avoirdupois ounces, and have inserted the following table of the actual quantities

The celebrated Mr. Euler has added many excellent deliberations on the subject of gunnery, in his translation of Robins's Gunnery into the German language; which were again farther improved in Brown's translation of the same into English, in 1777. See also Antoinoni's Examen de la Poudre; the experiments of MM. D'Arcy and Le Roy, in the Memoirs of the Royal Academy in 1751; and D'Arcy's Essai d'une Theorie de l'Artillerie, in 1760: Dr. Hutton's Tracts; and paper on the force of fired gunpowder, in the Philosophical Transactions for 1778. Of the common or parabolic theory of gunnery, Mr. Simpson has given a very neat and concise treatise in his Select Exercises.

GUNNING (Peter), a learned English prelate, born at How in Kent, in 1613, and educated at Clare-hall, in the university of Cambridge. Soon after he had taken his degree of M.A. he was appointed a fellow of Clare-hall; and when matters were approaching a crisis between the king and parliament, he distinguished himself by the zeal with which he defended his majesty's politics in his pulpit discourses. By this conduct he excited the indignation of the parliament party, who subjected him to a short imprisonment, and then ordered him to his college, where he continued to be tendered to him for subscription. Upon his firm refusal to submit to that imposition, he was ejected from his fellowship; when he determined to withdraw to Oxford, where the king at that time held his court. Before he left Cambridge, however, in conjunction with Mr. Barrow, afterward bishop of St. Asaph, Mr. Ward, afterward bishop of Salisbury, and some other friends, he drew up a spirited treatise against the Covenant, which was published in 1643. Upon his arrival at Oxford in 1644, Mr. Gunning met with a hospitable reception from Dr. Pink, warden of New College, who appointed him one of the chaplains of that foundation. In this situation he was sometimes fixed upon to preach before the king, or his Oxford parliament; on which account the universitv complimented him with the degree of bachelor of divinity, in the year 1646. After the surrender of Oxford to the parliament, he became tutor, first to
Christopher afterwards lord Hatton, and then to sir Francis Compton, whom he educated in a zealous attachment to monarchy and episcopacy.

After the reformation of Charles II. Mr. Gunning's influence at the court of the church of England was remembered, and preferments flowed upon him in a rapid succession. In 1660 he was restored to his fellowship at Cambridge, and promoted to a prebend in the church of Canterbury. In the same year he was created doctor of divinity by the king's mandate, and instituted to the mastership of Corpus-Chrifti college, and to lady Margaret's professorship of divinity. In 1661, upon the ejection of Dr. Tucker, he was created regius professor of divinity at Cambridge, and succeed to the mastership of St. John's college; and in 1669, he was promoted to the see of Chichester. While he prevailed over this diocese, he was very zealous in enforcing the laws for conformity, and on particular occasions acted the part of a civil magistrate, by breaking himself the meetings, and sitting on the bench at the quarter-seizings, when non-conformists were to be tried for their delinquency. In 1674 he was translated to the see of Ely, of which he proved an active superintendent and bountiful benefactor till his death, which took place in 1684, in the seventy-first year of his age. He was unquestionably a prelate of consider-able learning and ingenuity, who was sincerely and ardently attached to the constitution of the church of which he was a member; and, by his sufferings and zeal on account of it in troublous times, merited the preferments to which he was promoted on his being restored to a state of prosperity. His benevolence and charity were extensively exercised during his life-time, in the exhibitions and endowments which he granted for the support of scholars at the university, the improvement of his fees, and the relief of the indigent and distressed; and at his death the bulk of his remaining property was devised for the augmentation of poor vicarages.

His publications, though chiefly controversial, are full of interest with respect to the times in which he lived.

**GUNPOWDER**

A composition of nitre, sulphur, and charcoal, mixed together, and usually granulated. When fired, it explodes with great vehemence, by means of its elastic force. It is to this powder that we owe all the effect and action of guns, and ordnance of all sorts; so that fortification, with the modern military art, in a great measure depends upon it. Hence, (says the late ingenious captain Grofe,) the invention of gunpowder, and its application to fire-arms, may be ranked among the most important and beneficial of human discoveries. Perhaps, at first sight, the allusion of being a beneficial discovery, may seem somewhat paradoxical; but let any one compare the slaughter of ancient battles, with the killed and wounded in modern engagements, and the length and consequent miseries of sieges before and after the invention of gunpowder, where ordnance and char-maries were engaged, or the fame or similar places attacked, and I flatter myself the propriety of the epithet beneficial will be apparent. War is now carried on at a distance, and in large and distant bodies, so that the least advantage becomes instantly obvious; whereas formerly troops engaged hand to hand, whereby they were so intermingled as to be with difficulty separated; and besides the victor had no other certainty of his success, than by finding no more of the enemy to slaughter: in sieges, a numerous train of artillery, with a few barrels of this wonderful powder deposited in a mine, first shatters and then closes the strongest walls; and we now rarely hear of those long sieges, where thousands are destroyed by famine and fatigue. Indeed the great efect towards a victory or capitulation, is by gunpowder and artillery, brought about without any militia or slaughter, but solely by the terror raised by the noise, few men having sufficient firmness to stand their dreadful thunder; and it is undoubtedly a fact, that a battle or a town is won, more by the sight of those who are terrified at the cannon, than from the lofs of those killed or wounded by them.

The first introduction of gunpowder into Europe has generally been attributed to Roger Bacon, who wrote a treatise in 1280, in which he found the first hints for the application of it to the purposes of war. In 1329, Bartholomew Schwartz, a monk, is said to have invented it in Germany, by accidentally pounding in a mortar the ingredients of which gunpowder is made, and into which a spark of fire falling, blew the mortar to pieces. This opinion has lately been contradicted in France by citizen Langles, who contends, in a memoir read in the French national institute, that the knowledge of gunpowder was conveyed to us from the Arabs on the return of the crusaders into Europe, and that the Arabs, as we have seen above, made use of it to discharge their manganas or mortars at the siege of Mecca in 690; that they derived it from the Indians, who, in their sacred books forbidding the use of it in war, may reasonably be concluded to have known it for ages. Among the Chinese it has at all times been applied to useful purposes, as blasting rocks &c. in making of fire-works; although it has not been directed through strong metallic tubes, as the Europeans did very soon after they had discovered it.

The honourable George Napier procured some gunpowder made in China, and on the average analysis of two ounces of it (960 grains), he found it to consist of

Hence it will be seen that their proportion differs very little from the English proportion.

**PROCESS OF MANUFACTURING GUNPOWDER IN ENGLAND.**

The ingredients which form the substance of gunpowder, according to the present improved state of the manufacture, are combined in the following proportion: 720 grains of saltpetre, 144 grains of charcoal, and 9 grains of sulphur. The object principally to be attended to, is the purity of these ingredients; for, if they are defective, the gunpowder can never be good, though ever so well manufactured.

The saltpetre to be preferred is that usually imported from the East Indies. It is refined by solution, distillation, evaporation, and crystallization; after which it is fused, taking care not to use too much heat, that there may not be any danger of decomposing the nitre; by this means it is not only rendered more pure, but the water of crystallization is more completely got rid of. The principal object in refining the nitre is, to get it free from the earthy and salts it is combined with in its rough or grungy state; and which, by deliquescing, would
GUNPOWDER.

would make the gunpowder very liable to injury by attracting moisture, and, thereby decomposing the accurate mixture of the composition, render it unfit for use.

The best sulphur is that which is imported from Sicily. The difference in the influence of the sun's rays on carbon, is not now material as to the sorts of woods nearly alike, it is not now material as to the sorts of woods used; but as some authors state, but the most satisfactory method than the former; for which purpose it is sold in the summer season, and the carbon remains in the cylinder. This, it is evident, is a more eligible method than the former; and, indeed, the only proper one. The difference in the strength of the powder made from this sort of charcoal, can be very considerable, that is, in a year of moderate weather, almost dry, the powder used for the several pieces of ordnance by the navy, &c. has been reduced one-third, in consequence of the increased strength of the composition into which this charcoal enters.

The wood, before charring, has the bark taken off; for the powder is filled in the summer season, when the sap is up, and the wind will blow clean. One reason for taking off the bark is, that it would render the powder full of sparks; which would be of course injurious, and very dangerous in the use; a fact most clearly proved by the combustion of charcoal, with the bark on, in oxygen gas. The wood made use of is either willow, hazel, &c. as it absorbs, or expels from it, and it is in a fit state, it is taken off. The powder made up of charcoal of the poplar, willow, hazel, &c. It is made of the best sulphur than the finer kinds. Charcoal of sal-ammoniac, urine, as some authors state, but the most satisfactory method than the former; for which purpose it is sold in the summer season, and the carbon remains in the cylinder. This, it is evident, is a more eligible method than the former; and, indeed, the only proper one. The difference in the strength of the powder made from this sort of charcoal, can be very considerable, that is, in a year of moderate weather, almost dry, the powder used for the several pieces of ordnance by the navy, &c. has been reduced one-third, in consequence of the increased strength of the composition into which this charcoal enters.

The wood, before charring, has the bark taken off; for the powder is filled in the summer season, when the sap is up, and the wind will blow clean. One reason for taking off the bark is, that it would render the powder full of sparks; which would be of course injurious, and very dangerous in the use; a fact most clearly proved by the combustion of charcoal, with the bark on, in oxygen gas. The wood made use of is either willow, hazel, &c. as it absorbs, or expels from it, and it is in a fit state, it is taken off. The powder made up of charcoal of the poplar, willow, hazel, &c. This, it is evident, is a more eligible method than the former; and, indeed, the only proper one. The difference in the strength of the powder made from this sort of charcoal, can be very considerable, that is, in a year of moderate weather, almost dry, the powder used for the several pieces of ordnance by the navy, &c. has been reduced one-third, in consequence of the increased strength of the composition into which this charcoal enters.

The several ingredients, being thus prepared, are ready for manufacturing. They are, ift, ferrately ground to a fine powder; 2d, mixed together in the proportion of 30, the composition is then sent to the gunpowder-mill, which consists of two stones vertically placed, and running on a bed-dome. On this bed-dome the composition is spread, and wetted (not with sal-ammoniac, urine, &c. as some authors state, but with as small a quantity of water as will, together with the revolution of the light of the runners, bring it into a proper body, but not into a paste. After the stone runners have made the proper number of revolutions over it, and it is in a flat state, it is taken off. The powder-mill is a light wooden building with a boarded roof. Only from forty to fifty pounds of composition is worked here at a time, as an explosion will sometimes unavoidably happen from the runners and bed-dome coming in contact, and other accidental causes. These mills are either worked by water or by horses.

The powder taken from the mills is sent to the coming-house to be corned or grained. Here it is sifted through a hard and firm body, broken into small lumps, and the powder then gained by the runners, breaking the lumps into grains, and forcing them through the sieves, forming grains of several sizes. The grains are then separated from the dust by other sieves, and reels.

They are then hardened, and the rougher edges taken off by being run a sufficient length of time in a clofe reel, which has a proper circular velocity given it. The powder for cannon, mortars, and small arms, is generally made at one time, and always of the same composition. The difference in the influence of the sun's rays on carbon, is not now material as to the sorts of woods nearly alike, it is not now material as to the sorts of woods used; but as some authors state, but the most satisfactory method than the former; for which purpose it is sold in the summer season, and the carbon remains in the cylinder. This, it is evident, is a more eligible method than the former; and, indeed, the only proper one. The difference in the strength of the powder made from this sort of charcoal, can be very considerable, that is, in a year of moderate weather, almost dry, the powder used for the several pieces of ordnance by the navy, &c. has been reduced one-third, in consequence of the increased strength of the composition into which this charcoal enters.

Such is the present most approved method of manufacturing gunpowder in England. In France, the charcoal has been recently required, by an arrêt of government, to exert their utmost energies to excel us in the mode of preparation, and STRENGTH, of this important article. In consequence thereof, the celebrated chemist M. I. A. Chaptal, member and treasurer of the French Senate, early in the year 1805, delivered to that legislative body a paper upon the principles and method of manufacturing gunpowder superior to that of every other country; and of which the following is a faithful translation:

MANUFACTURE OF GUNPOWDER IN FRANCE.

"Gunpowder (says M. Chaptal) is formed by the accurate mixture of saltpetre, charcoal, and sulphur; and the different qualities of this powder depend on the proportions between the constituent principles, the purity of the materials, and the accuracy with which they are triturated and mixed together. The following are the results of the numerous experiments which I have made in the celebrated powder-manufactory at Grenelle.

"1. The proportion of saltpetre ought to be at least about 75 per cent. 2. The proportions which produce the best gunpowder, are 77 saltpetre, 14 charcoal, and 9 sulphur. The proportions most generally employed, are 76 saltpetre, 12 charcoal, 12 sulphur. 3. The proportion of sulphur may be diminished, or even omitted; but in this last case the powder is very porous, not sufficiently consistent, and is injured by carriage.

"When the proportion of sulphur is diminished, it is necessary to triturate the other materials with greater care. I have obtained very good powder by employing 3 per cent of sulphur. The powder for ordnance requires 6/5 sulphur than the finer kinds. Charcoal of white wood is employed in the making of powder, such as that of the poplar, willow, hazel, &c. It is made of the young branches of only two or three years growth. The charcoal ought to be used immediately after being made, as it absorbs, or expels from its pores, from 20 to 25 per cent. of air and water, which injures its quality. A very great difference exists between charcoal prepared in trenches and that prepared in the open air; the first is lighter, less compact, and is preferred for the composition of gunpowder.

"All the powder manufactured in France is prepared by
by the trituration of the three materials, in mills furnished with an apparatus adapted to this purpose; and the mechanism of which is so well known as to render a particular description of it unnecessary. We shall at present, therefore, confine ourselves to give a succinct idea of the principal operations executed in our improved powder-manufactures.

In the composition of the powder employed by miners, the 13 pounds of saltpetre, 4 of sulphur, and 3 of charcoal. In the fine powder used in war, 15 pounds of saltpetre, 2 pounds 8 ounces of charcoal. A single peffle is appropriated to each 20 pounds of the mixture. The materials are first stirred with a stick, and a small portion of water added to them, in order to prevent the volatilization of the sulphur and charcoal. The pounding usually continues twenty-one hours; the mean velocity of the peffles is about fifty-five strokes in a minute; their weight is eighty pounds; and they rise and fall to the height of a foot. The paste is removed from one mortar to another every hour, during the three hours and a half; and afterwards every three hours. At each change, care is taken to preserve the necessary humidity, in order that the paste may retain its coherence. When the paste is sufficiently formed, the mixture perfect, and the division complete, it is taken out of the mortars, and deposited in the graining-house.

As the paste retains a certain degree of humidity, it does not admit of granulation immediately on being taken out of the mortars; and therefore it is left in them for the remainder of two or three days in the graining-house before this operation commences. The granulation is performed by putting the dried matter into a sieve, of which the holes are in proportion to the size we wish to give to the grains. It is then covered with a piece of hard wood, from seven to eight inches in diameter by two in thickness, to which a rotatory motion is given, by moving with wood runs through the longitudinal diameter of these vessels; this axis, which projects at the two extremities, rests upon a wooden frame, and freely revolves upon itself; to the two extremities are adapted handles, in order to move the casks. Into each of these casks there are put twenty-five pounds of the composition; and they perform from thirty-five to thirty-five revolutions in a minute. The mixture and trituration of the materials are greatly assisted, by introducing into every one of these vessels eighty pounds of bronze, in small balls, four lines in diameter; and by ledges, or mouldings, applied to the inner sides of the cask.

The composition is known to be sufficiently pulverized, when, on a small portion of it being spread over a wooden pallet, with the blade of a knife, no roughness is perceptible; when the colour is uniform, and the knife experiences no resistance on its application to the pallet. On the composition being taken out of the pulverizing vessels, the next operation is to give it the requisite degree of confidence, to fit it for granulation; and this is performed by strong compression, and the aid of a little water. With this view, square pieces, of walnut-tree wood are provided, sixteen inches in length, by one foot in breadth, furnished with mouldings projecting from five to six lines. The inferior edges of the platters are hollowed out, so as to correspond with the inner angles of these mouldings, in order that they may be readily placed within each other.

The operation is commenced by covering the bottom of one of the tables with a piece of moist linen; over this is spread a stratum of the composition, which is carefully covered with a similar piece of wet linen, and a second platter adapted to it, filled in the same manner as the first. In this way, twenty-three platters are placed one above the other; the last of which is covered with a square piece of wood, and a heavy press screwed down upon the whole. By this means a hard cake is formed, which is broken by the hand, and after being dried, is subjected to the process of granulation, which was formerly used. Experience has, however, convinced me, that this last process is entirely preferable to the former. This manner of forming gunpowder polishes numerous advantages; rapidity in the execution, economy in the consumption of the materials,
rials, superiority of the produce, and safety in the operations." Hence it will be seen, that the process in manufacturing gunpowder in France, differs very little from that which is now adopted in England.

On the criterion of strength, undoubtedly depends the great superiority of gunpowder; and to effect this, the French chemists fabricated a gunpowder in which the marine or muriatic acid, which dissolves with astonishing violence, was substituted for nitre; and it was found to be of at least double the strength of common gunpowder. After a series of experiments had been made with it, its use was prohibited, on account of the great danger attending its easy dectration; since it was found to explode by the slightest stroke of a hammer, without even the aid of fire. But this strength of powder in a measure makes up for the absence of prejudice, arising from experiments with a preparation of this gunpowder at Woolwich, sufficient to ascertain the above facts, as well as to manifest its utility for any naval or military purpose whatever.—For the chemical properties of the marine or muriatic acid, see the article Chemistry, vol. iv. p. 217-219-237.

**ON THE EXPLOSIVE FORCE OF GUNPOWDER.**

To understand the force of gunpowder, it must be considered that, whether it be fired in a vacuum or in air, it produces by its explosion a permanently elastic fluid. See Philos. Trans. No 395; and Haukibee's Phyf. Mech. Exp. p. 81. It also appears from experiments, that the fluid produced by the firing of gunpowder, is, ceteris paribus, directly as its density. To determine the elasticity and quantity of this elastic fluid, produced from the explosion of a given quantity of gunpowder, Mr. Robins premises, that the elasticity of this fluid increases by heat, and diminishes by cold, in the same manner as that of air, and that the density of this fluid, and consequently its weight, is the same with the weight of an equal bulk of air, having the same elasticity and the same temperature. From these principles, and from the experiments by which they are established, he concludes, that the fluid produced by the firing of gunpowder is nearly three-tenths of the weight of the generating powder itself; and that the volume or bulk of this air or fluid, when expanded to the rarity of common atmospheric air, is about two hundred and forty-four times the bulk of the fluid generated powder. Count Saluce, in his Miscel. Phil. Mathem. Soc. Priv. Taurin. p. 125, makes the proportion as 222 to 1; which, he says, agrees with the computation of Mefris, Haukibee, and Rumford.

Hence it appears, that any quantity of powder fired in any confined space, which it adequately fills, exerts, at the instant of its explosion against the sides of the vessel containing it, and the bodies it impells before it, a force at least two hundred and forty-four times greater than the elasticity of common air, or, which is the same thing, than the pressure of the atmosphere; and this, without considering the great additional arising from the violent degree of heat with which it is endued at that time; the quantity of which augmentation is the next head of Mr. Robins's enquiry. He determines, that the elasticity of the air is augmented in a proportion somewhat greater than that of four to one, when heated to the extreme heat of red-hot iron; and supposing that the fluid generated powder is not of a less degree of heat, increasing the former number a little more than four times, makes nearly one thousand; which shews that the elasticity of the flame, at the moment of explosion, is about one thousand times stronger than the elasticity of common air, or than the pressure of the atmosphere. But it is known, that the pressure of the atmosphere upon every square inch, is on a medium 14.4 lb. and therefore one thousand times this, or 14750 lb. is the force or preture of the flame of gunpowder, at the moment of explosion, upon a square inch, which is very nearly equivalent to six tons and a half. This great force, however, diminishes as the fluid dilates itself, and in that proportion, viz. in proportion to the space it occupies, being only half the strength when it occupies a double space, one-third the strength when triple the space, and so on.

Mr. Robins supposes the degree of heat above mentioned to be a kind of medium heat; but that in the case of large quantities of powder, the heat will be higher, and in very small quantities lower; and that therefore in the former case the force will be somewhat more, and in the latter somewhat less, than one thousand times the force of the atmosphere. He farther finds the strength of powder is the same in all variations in the density of the atmosphere. But that the air of the earth has a great effect upon it; for the same quantity which in a dry season would discharge a bullet with a velocity of one thousand seven hundred feet in one second, will not in damp weather give it a velocity of more than one thousand three hundred feet in a second, or much less, if the powder be bad and negligently kept. See Robins's Tracts, vol. i. p. 101. And further, as there is a certain quantity of water, which, when mixed with powder, will prevent its firing at all, it cannot be doubted but every degree of moisture must abate the violence of the explosion; and hence the effects of damp on powder are not difficult to account for. It is a property of the fluid, that the heat of powder does not render it less active when dried again. Indeed, if powder be exposed to very great damp without any caution, or when common salt abounds in it, as often happens through negligence in refining the nitre, in such cases the moisture it imbibes may perhaps be sufficient to dissolve some part of the nitre; which is sufficient to abate the violence of the explosion, and hence the effects of damp on powder are not difficult to account for. And indeed, if powder be kept in a damp place, it cannot be doubted but every degree of moisture will abate the violence of the explosion; and hence the effects of damp on powder are not difficult to account for. But when the powder is taken in the building, and the nitre it is composed of has been well purged from common salt, it will retain its force for a long time; and it is said that powder has been known to have been preserved for fifty years without any apparent damage from its age.

The velocity of expansion of the flame of gunpowder, when fired in a piece of artillery, without either bullet or other body before it, is prodigiously great, viz. seven thousand feet per second, or upwards, as appears from the experiments of Mr. Robins. But M. Bernouilli and Mr. Euler supposed it is still much greater. Dr. Hutton supposed it may not be less, at the moment of explosion, than that of a jet of fire, from a single port. But Rumford, in a satisfactory and ingenious calculation, has shewn, that the force of the elastic fluid generated in the combustion of gunpowder, enormous as it is, may be easily explained on the supposition that it depends solely on the elasticity of watery vapour, or steam. From experiments made in France in 1790, it appears that the elasticity of steam is doubled by every addition of temperature equal to 30° of Fahrenheit's thermometer. As the heat generated in the combustion of gunpowder cannot be less than that of red-hot iron, it may be supposed equal to 1000° of Fahrenheit's scale; but the elastic force of steam is just equal to the mean pressure of the atmosphere, when its temperature is equal to that of boiling water, or to 212° of Fahrenheit's thermometer. Consequently, 212°-30°=182° will represent the temperature, when its elasticity will be equal to the pressure of two atmospheres; and, pursuing the calculation, at 625°, or 30° above the heat of boiling linseed oil, its elasticity will be equal to the pressure of 8152 atmospheres, or above eight times greater than the ultimate pressure of the fluid generated in the explosion of gunpowder, according to Mr. Robins's computation; but the heat in this case is much greater than that of 625° of Fahrenheit; and therefore the elasticity of the steam generated from the water contained in the powder...
GUNPOWDER.

I have never seen any so much, and I have frequently seen it left, than that of water.

4 In the foregoing account I have confined myself to a simple relation of facts, from a consideration of which the following observations have been deduced.

That the exploitive force of gunpowder depends very materially on the purity of the carbon employed. (Exper. 7.) 2d. That the mixture only of the ingredients does not make that thorough incorporation necessary for the proper combution and exploitive effects of gunpowder. (Exper. 3, 4, 5, 6.) 3d. That the less moisture there is in gunpowder, the stronger is its effect. This is clear, from gunpowder which has attracted any degree of humidity being weaker than when first made.

I shall now beg to submit some ideas that occur to me from a consideration of the whole of the circumstances I have related, and from what may be deduced from an examination of the component parts of gunpowder. It appears to me that no part of the exploitive force consists in elastic vapour, formed by the combustion, from water contained in it. So small a portion of water is in the ingredients, and I have observed that not any is gained in the manufacturing, that I cannot conceive any water is carried off undecomposed but that it is converted into hydrogen and oxygen gases. Mr. Cruickshank observes, after the explosion of gunpowder over mercury, no water is seen.* I am of opinion, that the exploitive force of gunpowder consists wholly in the several gages formed by the combustion; and that, the quicker it takes fire, the more gas is generated in a given time, and its force consequently augmented. Lavoisier observes, its effect is increased by the quantity of calorick digested at the moment of deflagration. It seems, therefore, that the combustion is carried on by the oxygen supplied from the nitre; that this gas is instantly taken up by the sulphur and carbon; and, converting those substances into carbonic and sulphureous acid gages, azotic gas being at the same time liberated from the nitre, the water which may be in the nitre, and also that which is in the charcoal, is decomposed; and the oxygen taken up by the carbon and sulphur and the hydrogen, set free. The force arising from these gases, with the increased elasticity they receive from the increase of temperature caused by the combustion, is surely sufficient to account for all the effects we observe in gunpowder.

It may perhaps serve to elucidate the subject, if we consider a little more minutely what the component parts of gunpowder are, from chemical analysis.

NITRE. One hundred parts of nitre, according to Kirwan, confist of

Potash Acid Water of composition 42/3

Potash 51 8 44 0 49 6

Water of composition 4 2

Sulphur, according to Lavoisier, absorns 25714 of oxygen in combustion. From several experiments which I have made, I have reason to conclude, that charcoal, when used, contains about one-eighth part of water, which it has absorbed.

SULPHUR, according to Berthollet, requires for every hundred parts 36/8 of oxygen to form sulphuric acid; of course, a smaller quantity of oxygen would be necessary for their conversion into sulphureous acid gas: I shall take this at 30 per cent. which is probably not far from the truth, and, at any rate, near enough for our present purpose. No experiment, that I know of, has been made to ascertain this point.

Admitting the foregoing observations to be tolerably correct, the following will turn out to be the quantities

Oxygen, 30 : 34 parts
Hydrogen, 7 : 80 parts
Carbon, 15 parts

We know that the whole of the charcoal is not consumed in the act of combustion; Mr. Cruickshank says, three parts remain of one hundred parts of gunpowder, therefore only 10 : 13 parts are destroyed. Now, 30 : 13 parts of charcoal used, will easily account for this difference of one hundred parts of gunpowder. The quantity of each ingredient is pretty well regulated, since made, I am induced to form the same opinion, as you think to be an alkaline sulphuret mixed with carbonat of potash, very deliquecent, and when exposed to the air absorbs it.

It is clear that the smallest error in the quantity of charcoal used, will easily account for this difference of oxygen. On the above calculation it appears, that the quantity of each ingredient is pretty well regulated, and that the gases formed will be expended in producing the effects which we observe in the combustion of gunpowder.

The residuum of fired gunpowder Mr. Howard thinks to be an alkaline sulphuret mixed with carbonat and sulphat of potash. But by several trials I have since made, I am induced to form the same opinion, as Mr. Cruickshank says, the quantity I have not had an opportunity of ascertaining. Mr. Cruickshank says: "This residuum is very deliquecent, and when exposed to the air absorbs moisture sufficient to dissolve a part of the alkali; in consequence, the charcoal becomes exposed, and the whole assumes a dark or black colour: that this residuum is potash united with a small proportion of carbonic acid, sulphat of potash, a very small quantity of sulphate of potash and unconfumed charcoal: and, that one hundred grains of gunpowder yield fifty-three grains, of which three are charcoal."

The discharge of fire-arms, count Rumford remarks, that there is always a portion of unconfumed grains of gunpowder blown out of them; and what is very remarkable, as it leads directly to a discovery of the cause of this effect, these unconfumed grains are not merely blown out of the muzzles of fire-arms, but come out also by their vents or touch-holes, where the fire enters to inflame the charge, as many persons who have had the misfortune to flay with their faces near the touch-hole of a musket, when it has been discharged, have found to be the fact, by having the grains forced into the skin. It seems extremely improbable, if not absolutely impossible, that a grain of gunpowder actually in the chamber of the piece, and completely surrounded by flame, should, by the action of that very flame, be blown out of it without being at the same time set on fire. And, if this be true, it tends to prove not only that the combustion of gunpowder is less rapid than it has generally been thought to be, but that a grain of gunpowder actually on fire, and burning with the utmost violence over the whole of its surface, may be projected with such a velocity into a cold atmosphere, as to extinguish the fire, and suffer the remains of the grain to fall to the ground unchanged, and as inflammable as before.

This extraordinary fact has been ascertained, beyond all possibility of doubt, by the count's experiments. Having procured from a powder-mill, in the neighbourhood of the city of Munich, a quantity of gunpowder, all of the same mass, but formed into grains of different sizes, some as small as the grains of the finest Battel powder, he placed a number of vertical screens of very thin paper, one behind another, at the distance of twelve inches from each other; and loading a common musket repeatedly with this powder, sometimes without and sometimes with a wad, he fired it against the finest screen, and observed the quantity and effects of the unconfumed grains of powder which impinged against it. The screens were so contrived, by means of double frames united by hinges, that the paper could be changed with very little trouble, and it was actually changed after every experiment.

The distance from the muzzle of the gun to the first screen was not always the same; in some of the experiments it was only eight feet, in others it was ten, and in some twelve, feet. The charge of powder was varied in a great number of different ways; but the most interesting experiments were made with one single large grain of powder, propelled by smaller and larger charges of very fine-grained powder. These large grains never failed to reach the screen; and though they sometimes appeared to have been broken into several pieces by the force of the explosion, yet they frequently reached the screen entire; and sometimes passed through all the screens (five in number) without being broken.

When they were propelled by large charges, and consequently with great velocity, they were often on fire when they arrived at the first screen; which was evident, not only from their not setting fire to the paper, (which they sometimes did,) but also from their being found sticking in a soft board, against which they struck, after having passed through all the five screens; or leaving visible marks of their having been impinged against it, and being broken to pieces and scattered by the blow. These pieces were often found lying on the ground, and from their forms and dimensions, as well as from other appearances, it was often quite evident that the little globe of powder had been on fire, and that its diameter had been diminished by the combustion before the fire was put out, on the globe being projected into the cold atmosphere. That these globes or large grains of powder were always set on fire by the combustion of the charge, can hardly be doubted. This certainly happened in many of the experiments; for they arrived at the screens on fire, and set fire to the paper; and in the experiments in which they were never set on fire, they sometimes passed through the air on fire; and when this was the case, no vestige was to be found. They sometimes fell on fire through several of the finest screens, without setting them on fire, and set fire to one or more of the hindmost, and then went on and impinged against the board, which was placed at the distance of twelve inches from the last screen.

The count then proceeded to another experiment, in which the progressive combustion of gunpowder was shewn in a manner still more striking, and not less conclusive. A small piece of red-hot iron being dropped down into the chamber of a common horse-pistol, and the pistol being elevated to an angle of about forty-five degrees, upon dropping down into its barrel one of the small globes of powder (of the size of a pea), it took fire,
fire, and was projected into the atmosphere by the elastic fluid generated in its own combustion, leaving a very beautiful train of light behind it, and disappearing all at once like a falling star. This amusing experiment was repeated very often, and with globes of different sizes. When very small ones were used finely, they were commonly consumed entirely before they came out of the barrel of the pistol; but when several of them were used together, some, if not all of them, were commonly projected into the atmosphere on fire.

As this imperfect combustion of the gunpowder seems to be the cause which has hitherto prevented its almost incredible force from being more accurately ascertained; the count deduces, as an evident consequence, that the real power of fire increases in proportion as the two ingredients, to increase its force, can be made so as to accelerate its inflammation. This may be done in various ways; but, in his opinion, the most simple and most effectual manner of doing it would be to let fire to the charge of powder, by firing (through a small opening) the flame of a smaller charge into the main one. He contended an in principle for firing cannon, and it was found, on repeated trials, to be useful, convenient in practice, and not liable to accidents. It likewise superceded the necessity of using priming, of vent-tubes, port-fires, and matches; and on that account he imagines it might be made useful in the British navy.---For other experiments on the explosive force of gunpowder, see the article Civate, p. 371.

It has been observed by M. Humboldt, in the Journal des Sciences et des Arts, that the effects of gunpowder, in mines, &c. have been found to be very much increased by leaving a considerable space between the powder and the wadding. He says, that the person who made this discovery was led to it by the consideration of the well known fact, that the explosion is less violent in proportion as the ingredients are incorporated together; but, if the other heaps also take fire at the same time, it is presumed, that either the common salt was mixed with the nitre, or that the coal was not well ground, or the whole mass was not well beat together, and if this mixture were used merely as a train of communication to the powder with- in the globe, what a vallavailing would it be in works car- ried on upon an extensive scale, such as the numerous quarries and mine-works of this kingdom!*

**METHOD OF PROVING GUNPOWDER.**

There are several methods of examining gunpowder; some with regard to its purity, others with regard to its strength. Its purity is known by laying two or three small heaps near each other, and firing one of them. For if this takes fire readily, and the smoke rises upright, without leaving any drofs or sece- lent matter behind, and without burning the paper, or firing the other heaps, it is esteemed a sign that the ful- phur and nitre were well purified, that the coal was good, and that the three ingredients were thoroughly incorporated together; but, if the other heaps also take fire at the same time, it is presumed, that either the common salt was mixed with the nitre, or that the coal was not well ground, or the whole mass was not well beat together, and if either the nitre or sulphur be not well purified, the paper will be foul or spotted.

Several instruments have been invented to ascertain the strength of gunpowder, such as powder-triers acting by a spring, commonly fold at the shops; and others again that move a great weight, throwing it upwards, which is, however, an eprouvette not to be depended upon. These machines, says Mr. Robins, though more perfect than the common powder-triers, are yet liable on the contrary to produce such an error, as to give an idea of the inflammable stroke of the flame, and not by its continual preasure, they can never determine the force of the fired powder with sufficient certainty. Another method is to judge from the range given to a large solid ball, thrown from a very short mortar, charged with a small quantity of powder; which is in an uncertain way, both on account of the great disproportion be- tween the weight of the ball and powder, and the unequal refilience of the air; not to mention that it is too tedious to prove large quantities of powder; for, if each barrel of powder was to be proved in this manner, the trouble of charging the mortar, and bringing back the ball each time, would prove an endless business; and if a number of barrels were to be received on the merit of a few, it is very probable that some bad ones would occur amongst them, which may prove a great injury to the service in time of action. These exceptions do no ways hold (says Mr. Robins) against the method by which I have tried the comparative strength of different kinds of powder, which I have tried by the actual velocity given to a ball by such a quantity of powder as is usually esteemed a proper charge for the piece: and as this velocity, however great, is easily discovered by the motion which the pendulum acquires from the stroke of the ball, it might seem a good amendment to the method used by the French, viz. that...
that of the small mortar above-mentioned,) to introduce this puzzle by the pendulum instead of it. But though I am satisfied, that this would be much more accurate, less laborious, and reader, than the other, yet, as there is some little attention and caution required in this practice, which might render it of less dispatch than might otherwise be the case, a great number of barrels are to be separately tried, I should myself choose to practice a small method not less certain, but prodigiously more expeditious; so that I could engage, that the weighing out of a small parcel of powder from each barrel should be the greatest part of the labour; besides, the machines for this purpose, as they might be made of cast iron, would be so very cheap, that they might be multiplied at pleasure."—Robins, p. 173.

It is not certainly known what might be the particular conclusion of the eprouvette here hinted at, but it was probably a piece of ordnance suspended like a fons, from those ideas and experiments of Mr. Robins, that, as far as it extends, each barrel should be the greatest part of the labour; and, doubtless, three or four hands could, by this method, weigh five hundred barrels in a morning; besides, the machines for this purpose, as they might be made of cast iron, would be so very cheap, that they might be multiplied at pleasure.

To RESTORE damaged GUNPOWDER.

Then ethod used by the powder-merchants is this: they put part of the powder on a fail-cloth, to which they add an equal weight of what is really good; then with a thong they mingle it well together, dry it in the sun, and barrels it up, keeping it in a dry place. But this method, as Mr. Robins observed above, the weighing of the powder is not necessary, and the strength of the powder is accurately shown by the arc of the gun's recoil. The whole machine is so simple, easy, and expeditious, that the machine is so simple, easy, and expeditious, that no person could be found to practice it, unless for immediate use to be kept in or near the place of making, except in brick or stone magazines fifty yards at least from the mill. All powder-makers have a brick or stone magazine near the Thames below Blackwall, to keep the gunpowder when made, on penalty of $35. per month; and 51. a-day for not removing it when made, with possible diligence. Charcoal not to be kept within twenty yards of the mill. No dealer to keep more than two hundred pounds of powder, nor any person not a dealer more than fifty pounds, in the cities of London and Westminster, or within three miles thereof; or within any other city, borough, or market-town, or one mile thereof; or within two miles of the king's palaces or magazines, or half a mile of any parish church; on pain of forfeiture and as per pound; or to be kept in licenced mills; or to be kept within twenty yards of the mill. Various means are directed for the safe conveyance, in both cases. Justices of peace may search mills, houses, carriages, &c. Outward bound ships to take in, and homeward bound to discharge, their gunpowder at or below Blackwall; and be searched by the officers of the Trinity-house. Penalties to be recovered before two justices; and prosecutions to be within fourteen days. General exceptions are made as to his majesty's mills, flourhouses, and magazines; and as to powder lent with the army or militia; and exported or carried coastwise below Blackwall. It seems that erecting powder-mills, or keeping magazines of gunpowder, near a town, is a breach of the common-law, punishable by indictment or information. St. 66. 13.

GUNPOWDER, a river of the American States, on the western shore of Maryland, whose chief branches unite a little above Joppa, and empty into Chesapeake Bay, about twelve miles above PatapSCO river. It is navigable only a few miles, by reason of falls.

GUNPOWDER NECK, near the head of Chesapeake Bay, is a curious peninsula formed by Gunpowder River and Buff River.

GUNSHOT, f. The reach or range of a gun; the space to which a shot can be thrown.—Those who are come over to the royal party are suppofed to be out of gunshot. Dryden.

GUNSHOT, adj. Made by the shot of a gun.—The symptoms I have translated to gunshot wounds. Wiffenian.—See the article SURGERY.

GUNSHOT WOUNDS. See the article SURGERY.

GUNSMITH, f. A man whose trade is to make guns and pistols, but not cannon.—Walnut-tree is in particular esteem with the gunsmiths for stocks. Mortimer.

GUNSTICK, f. The ramrod; or stick with which the charge is driven into a gun.—Ev'n a gunstick flying into fame. Shak.

GUNSTOCK, f. The wood to which the barrel of the gun is fixed.—The timber is used for bows, pulleys, screws, mills, and gunstocks. Mortimer.
GUNSTONE, s. The shot of cannon. They used formerly to shoot stones from artillery:

Tell the pleasant prince, this mock of his
Hath turn'd his ball to gunstones, and his foul
Shall stand fore charg'd for the wafteful vengeance
That shall fly with them. — Shakespeare.

GUNTER (Edmund), an eminent mathematician, born in the county of Hereford, in 1581. He received his classical education on the royal foundation at Wem- nibury-college, whereafter he was elected to Christ-church college in Oxford. He was admitted to the degree of B. A. in 1603, and to that of M. A. in 1606; after which he entered into orders, and proceeded bachelor of divinity in 1615. His genius had early led him to the pursuit of mathematical studies; and at the time when he took his degree of M. A. he had merited the title of an inventor, by his first projection of the sector, of which he then wrote a description in Latin, and permitted his friends to transcribe it, though the English account of his invention was not published till seven years afterwards. The reputation which he had now acquired in the mathematical world occasioned his introduction to the acquaintance of some of the ablest mathematicians of his time, by whose recommendation and interest he was elected professor of astronomy at Gresham college, London, in 1619. In this situation he soon distinguished himself by his lectures and by his writings, which contributed greatly to the improvement of science. His first publication after his election, appeared in 1620, and was entitled, Canon Triangulorum, five Tabulæ Sinuum artificiatis ad Radius 10,000,000, et ad Sercum per Quadrant, 4to. This treatise was accompanied with the first 1000 of Briggs's logarithms of common numbers. In the second edition of it, which was published in English in 1624, under the title of Canon Triangulorum, or Table of artificial Sines and Tangents to a Radius of 10,000,000 Parts to each Minute of the Quadrant, 4to. the logarithms were continued from 100 to 10,000, and a rule was given at the end for augmenting them to 100,000. These tables were the first of the kind which had been given to the world, and, if the author had published nothing else, would have preferved his memory to the latest posterity, by the admirable which they afforded to students in astronomy.

In 1622, Mr. Gunter made his important discovery, that the magnetic needle itself varies.

To this discovery he was led in the course of experiments which he made on the variation at Deptford, by which he found that the declination of the needle had changed almost five degrees in the space of forty-two years. The truth of his discovery was afterwards confirmed and established by Mr. Gellibrand, his assistant, at Gresham college. Soon after this he invented his famous "rule of proportion," which is an easy and excellent method of combining arithmetic and geometry, adapted to the understanding of persons of the most ordinary capacities. It consists in applying the logarithms of numbers, and of lines and tangents, to straight lines, drawn on a scale or rule; by which proportions in numbers and trigonometry may be resolved by the mere application of a pair of compasses: a method founded on this property, that the logarithms of the terms of equal ratios are equal-different. This was called Gunter's proportion, and Gunter's line; and the instrument, in the form of a two-foot scale, is now in common use for navigation and other purposes, and is commonly called the Gunter. In 1624, this invention was carried into France by Mr. Wingate, who not only communicated it to most of the principal mathematicians then at Paris, but also, at their request, published an account of its use in the French language. Mr. Gunter likewise greatly improved the sector and other instruments, for the same ufes: the description of all which he published in 1624, is a treatise, entitled, The

Cros-Staff, in three Books, &c. 4to. In the same year he published, by King James's order, a small tract entitled, The Descrip[ion and Use of His Majest's Dials in Whitehall Garden, 4to. Mr. Gunter was the first who used the word "sector," from the line of artificial arcs, for the line of a complement of an arc. To him, likewise, the mathematical world is indebted for many other inventions and improvements, most of which were the subjects of his lectures at Gresham college, and afterwards deposited into treatises, which were printed in his works. The highest expectations were formed of his future services in the cause of useful science, when they were unhappily disappointed by his death in 1626, in the forty-fifth year of his age. His works have been carefully collected, and many editions of them published. The fifth is by William Leybourn, in 1673, 4to. containing the description and use of the sector, cros-staff, bow, quadrant, and other instruments; with several pieces added by Samuel Forster, Henry Bond, and William Leybourn.

GUNTER's CHAIN, the chain now in common use for measuring land, according to statute measure; so called from Mr. Gunter, its inventor. The length of the chain is sixty-six feet, or twenty-two yards, or four poles of five and a half yards each; and it is divided in chains, and multiplied together, gives the content in square chains; which therefore being divided by 10, or a figure cut off for decimals, brings the content to acres; after which the decimals are reduced to roods and perches, by multiplying by 4 and 40. But the better way is to set the dimensions down in links as integers, considering each chain as 100 links; then, having multiplied the dimensions together, produce for every links, divide thefe by 100,000, that is, cut off five places for decimals, the reft are acres, and the decimals are reduced to roods and perches, as before.

Example. Suppose in measuring a rectangular piece of ground, its length be 795 links, and its breadth 480 links,

<table>
<thead>
<tr>
<th>Per.</th>
<th>100'30'</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ro.</td>
<td>3'264</td>
</tr>
<tr>
<td>4</td>
<td>3'80</td>
</tr>
<tr>
<td>3180</td>
<td></td>
</tr>
<tr>
<td>3'81600</td>
<td></td>
</tr>
</tbody>
</table>

So the content is 3 acres, 3 roods, 10 perches.

GUNTER's LINE, a logarithmic line, usually graduated upon scales, sectors, &c. and so called from its inventor Mr. Gunter. This is otherwise called the base of lines, or line of numbers, and consists of the logarithms transferred upon a rule, from the tables, by means of a scale of equal parts, which therefore serves to resolve problems intrumentally, in the same manner as logarithms do arithmetically. For, whereas logarithms resolve proportions, or perform multiplication and division, by only addition and subtraction, the same are performed on this line, by turning a pair of compasses over this way or that, or by sliding one slip of wood by the side of another, &c. This line has been contrived various ways, for the advantage of having it as long as possible. As, first, on the two-feet rule or scale, by Gunter. Then, in 1627, the logarithm of any number was found by Wingate on two separate rulers, sliding against each other, to save the use of compasses in resolving proportions. They were also in 1627 applied to concentric circles by Oughtred. Then in a spiral form by Mr. Milbrune
Milburn of Yorkshire about the year 1650. Also, in 1657, on the present common lodging rule, by Seth Partridge.

Mr. William Nicholsoon has proposed another disposition of them, on concentric circles, in the Philof. Trans. an. 1727, p. 291. His instrument is equivalent to a straight rule of 28 inches long. It consists of three concentric circles, engraved and graduated on a plate of about 11/4 inches in diameter. From the centre proceed two legs, having right-lined edges in the direction of radii; which are moveable either singly, or together. To use this instrument, place the edge of one leg at the antecedent of any proportion, and the other at the consequent, and fix them to that angle: the two legs being then moved together, and the antecedent leg placed at any other number, the other leg gives its consequent in the like position or situation on the line. The whole length of the line is divided into two equal intervals, or radii, of 9 larger divisions in each radius, which are numbered from 1 to 10, the 1st standing at the beginning of the line, because the logarithm of 1 is 0, and the 10 at the end of each radius; also each of these 9 spaces is subdivided into 10 other parts, unequal according to the logarithms of numbers; the smaller divisions being thus, if the larger division be units or ones, the smaller are tenths of the larger; thus, if the larger be 10's, the smaller are 10's; &c.

1. To find the Product of two Numbers.—Extend the compasses from 1 to either of the numbers, and that extent will reach the fame way from the other number to the product. Thus, to multiply 7 by 5, extend the compasses from 1 to 7, and the extent will reach from 7 to 35, which is the product.

2. To divide one Number by another.—Extend the compasses from the divisor to 1, and that extent will reach the fame way from the dividend to the quotient. Thus, to divide 35 by 5, extend the compasses from 5 to 1, and that extent will reach from 35 to 7, which is the quotient.

3. To find a 4th Proportional to three given Numbers; as suppose to 6, 9, and 10. Extend from 6 to 9, and that extent will reach from 10 to 15, which is the 4th proportional found. And the fame way a 3d proportional is found to two given terms, extending from the 11th to the 12th, and the 2d from the 12th to the 3d.

4. To find a Mean Proportional between two given Numbers, as suppose between 7 and 28. Extend from 7 to 28, and biseect that extent; then its half will reach from 7 forward, or from 28 backward, to 14, the mean proportional between them. Also, to extract the square root, as suppose 25, which is a 4th proportional between 1 and the given square 25, biseect the distance between 1 and 25, and the half will reach from 1 to 5, the root sought. In like manner the cubic or 3d root, or any higher root, is found, by taking such part of it as is denoted by the index of the root, viz. the 3d part for the cube root, the 4th part for the 4th root, and so on, and that part will reach from 1 to the root sought. If the line on the scale or rule have siders, this is to be used instead of the compasses.

GUNTER'S QUADRANT, a quadrant made of wood, brass, or some other substance; being a kind of stereographic projection on the plane of the equinoctial, the eye being supped in one of the poles: so that the tropic, ecliptic, and horizon, form the arches of circles, but the hour circles other curves, drawn by means of several altitudes of the sun for some particular latitude every day in the year. The use of this instrument is to find the hour of the day, the sun's azimuth, and other common problems of the sphere or globe; as also to take the altitude of an object in degrees. See the article QUADRANT.

GUNTER'S SCALE, usually called by feamen the
The text appears to be a page from a book discussing various geographical locations, focusing on rivers, cities, and other features. The text is fragmented, and some sections are not fully legible due to the resolution of the image. Here is a section-by-section breakdown of the readable text:

- **GUR**

The text begins with a mention of various locations, including:

- **GURZENHAUSEN**, a town of Germany, in the circle of Franconia, and margraviate of Anspach, on the Altmühl. It contains two churches and an hospital; and sometime since there was a design to establish an university; ten miles south-south-east of Anspach, and seventeen east of Dinkelsbühl.
- **GUR, Choba, a dwelling**.
- **GUR, a town of Palestine, situated near Tuleam in the half-tribe of Manasseh, west of Jordan; where Abiahrizh-king of Judah was mortally wounded by Jehu king of Israel. Kings xxvi. 7.**
- **GURBA, a town of Africa, on the easter coast of the kingdom of Tunis, forming a considerable place, though the ruins of an aqueduct and citernes are the only remains of its former grandeur. Part of it has been swallow'd up by the sea; twenty-one miles south-west of Cybea.**
- **GURBE, a town of the island of Ceylon; eighteen miles south-east of Columbo.**
- **GURCK, a town of Germany, in the duchy of Carinthia, situated on a river of the same name, within the territories of the archbishopric of Salzburg; the seat of a bishop. Its principal trade is in iron; twelve miles north of Clagenfurt, and 126 south-west of Vienna.**
- **GUR, a river of Germany, which rises from the Lake Sepach, in the north-east part of Upper Carinthia, passes by the town of Gurtz, and runs into the Draue about a mile above Volkenmarck.**
- **GURCKFELD, a town of Germany, in Lower Carinthia, situated on the Save; twelve miles south-south-east of Cilli, and six west of Reim. Lat. 46. 9. N. Ion. 32. E. Ferro.**

- **GURDAIZ, a town of Affia, in the country of Limeric; twenty-eight miles east of Ghizni.**

- **GURZENHAUSEN**, a town of Germany, in the circle of Franconia, and margraviate of Anspach, on the Altmühl. It contains two churches and an hospital; and sometime since there was a design to establish an university; ten miles south-south-east of Anspach, and seventeen east of Dinkelsbühl.

The text continues with various other locations mentioned, including:

The text concludes with various other locations mentioned, including:

- **GURDAIZ, a town of Affia, in the country of Limeric; twenty-eight miles east of Ghizni.**

The text is rich in geographical information and historical notes, providing insights into various locations and their historical significance. The text is clearly written in a scholarly or educational context, aiming to provide comprehensive information about the regions discussed.
The troubling Tyber clashing with his sons.

To emit in a copious effusion.—The gaping wound gushed out a crimson flood. Dryden.

Line after line my gusting eyes o’erflowed. Pope.

GUST, n. An emission of liquor in a large quantity at once; the liquor so emitted.—If a lung-vein be burst, generally at the first cough a great gust of blood is coughed up. Horace.

GUSNOI, a cape on the west coast of Nova Zembla. Lat. 73° 30' N., long. 69° E. Ferro.

GUSPA GO, a district of Benaco, in Italy, which comprehends, in thirteen communes, 100,000 souls. Its principal places are the populous little town Guuspacea, at the foot of the eminence; and the village Rodengo.

GUSSET, n. [gusset, Fr.] Any thing sewed on to cloth in order to strengthen it. Pope.

GUSSET, n. In heraldry, an abatement of honour formed by a line drawn diagonally a little way from the upper corner of the escutcheon and then dropped perpendicularly to the extreme base.

GUSSELENGO, a town of Italy, in the Veronese, on the Adige: six miles north-west-west of Verona. GUST, n. [gust, Fr. gusus, Lat.] Sense of tasting: Destroy all creatures for thy sport or gust; yet cry, if man’s unhappy, God’s unjust. Pope.

Height of perception; height of sensual enjoyment: My sight, and smell, and hearing, were employ’d, and all three senses in full gust enjoy’d. Dryden.

Love; liking.—We have left in a great measure the gust and relish of true happiness. Tilleyson.

To kill, I grant, is man’s extreme gust; but, in defence, by mercy ’tis made just. Shakespeare.

Turn of fancy; intellectual taste.—The principal part of painting is to find what nature has made most proper to this art, and a choice of it may be made according to the gust and manner of the ancients. Tottifon.

Your gusts are triple to your common dew. Shakespeare.

GUSTABLE, adj. [gusto, Lat.] To be tasted.—This position informs us of a vulgar error, terming the gall bitter; whereas there is nothing gustable sweeter. Horace.

—Pleasant to the taste.—A gustable thing, seen or smelt, excites the appetite, and affects the glands and parts of the mouth. Derham.

GUSTATION, n. [gusto, Lat.] The act of tasting.

—The gullet and conveying parts partake of the nerves of gustation, extending into the lung. Broome.

GUSTAVIA, f. [so named by the younger Linnaeus in memory of Gustavus III. king of Sweden, who presented a great collection of Indian plants to the elder Linnaeus.] In botany, a genus of the clafs monadelphia, order polyanthida, natural order of myrtus. Juss. The generic characters are—Calyx: none; but the receptacle and surrounding the fruit, flat, broad, flat, balsam. Stamina: filaments very numerous, shorter than the petals, uniting at the base into an upright bell distant from the style. Anther small, oblong, upright, shorter by half than the petals. Pistillum: germ turbinate, inferior, flat, balsam between the petals and the style. Style comical, very short, permanent. Stigma blunt, (lobes, Gardner.) Pericarpium: berry subglobose, subconical, truncate, solid, crowned with the rim of the receptacle; (four to seven-celled. G.) Seeds: beans several, oval, smooth, mutilated on one side at the base; with a cartilaginous twisted appendix.—Essential Characters. Calyx, none; petals, several; berry many-celled; seeds, appendiculated.

GUSTAVIA AUGUSTA, a single species. It is a tree, with thick branches, and from twenty to thirty feet high. Leaves alternate, subobtuse, somewhat crowded, in the upper part broad-lanceolate, narrower at the base, from a span to a foot in length, ribbed, suberose, smooth on both sides. Peduncules from one to three, terminating, bearing one flower, and having one joint. Flower very precocious, larger than the white water-lily, with a large, naked, bald disk or receptacle between the corolla and the style; petals white, with red tips, the confidence of the white lily. Filaments united at bottom into a membrane, and being inserted into the base of the corolla, are of the nature of those in the class isocændria; style minute, yellow. The seed-veil is a juiceless berry, of a turbinate-globular form, with mucilaginous-like swellings, acute at top, and slightly concave, produced at bottom into a conical furrowed peduncle: the skin is coriaceous, whitish, ash-coloured, veined, yellow within, and very smooth: the cells are from four to seven: and the partitions are thin, like paper, and flexuose. The seeds are from three to five in each cell, ovate, variously angular from the prejudice of those next them; of a yellowish-cinnamon colour, fixed to the internal angle of the cells from the top to the middle by permanent twisted umbilical chords, so that the upper ones are pendulous, but the lower obliquely or horizontally descendent. The flowers smell like the lily; but the wood is extremely fetid, even after it is dry: the inhabitants use it for hoops. It is a native of Suriham and the island of Cayenne.

Pirigara Lexipetalas, Annilot Giusen. 490. t. 193, isa distinct species from this.

GUSTAVSWERTH, a fortresses of Finland, in the province of Nyland, near Helsingfors.

GUSTAVUS, J. I., II. and III. illustrious kings of Sweden; for the civil and political history of whom, see the article Sweden.

GUSTEN, a town of Germany, in the circle of Upper Saxony, and duchy of Anhalt Goethen: five miles west of Bernburg.

GUSTFUL, adj. Tasteful: well-tasted.—What he defaults from some dry infipid, is but to make up for some other more gustiful. Decay of Piety.

GUSTI, a town of Pomerania in the province of Pomerania: seventy-five miles north of Schiraz.

GUSTO, f. [Italian.] The relish of any thing; the power by which any thing excites sensations in the palate.—Pleasant gusts gratify the appetite of the luxurious. Derham. —Intellectual taste; liking.—In reading what I have written, let them bring no particular gust about with them. Dryden.

GUSTO, a town of Germany, in the circle of Upper Saxony, in Anerior Pomerania: twelve miles south-west of Bergen.

GUSTROW, a town of Germany, in the circle of Lower Saxony, and duchy of Mecklenburg, situated on the Nebe河 river, celebrated for its beer, which forms the principal part of its trade. Sixteen miles south of Rathenow, and twenty-nine east of Wismar. Lat. 53° 44’ N. 19° 34’ E. Ferro.

GUSTY, adj. Stormy; tempestuous.—Whirl’d tempestuous by the gusty wind. Thomson.

Once upon a raw and gusty day, The troubled Tyber chancing with his shores. Shakespeare.

GUSUM, a town of Sweden, in the province of East Gotland.
Gothland: twenty-two miles south-east of Nordkoping.

GUT, f. [Hutellin, Germ.] The long pipe reaching with many convolutions from the stomatch to the vent.

—The intestines or guts may be inflamed by any acrid or poisonous substance taken inwardly. Arbuthnot.—The stomatch; the receptacle of food: proberably:

With false weights their servants' guts they cheat,
And pinch their own to cover the deceit. Dryden.

Gluttony; love of gormandizing:

A picus, thou diid on thy guts below
Full ninety millions; yet, when this was spent,
Ten millions still remain'd to thee; which thou,
Feast to a fatter third and finishment,
In poison'd potion drank it. Hakewill.

To GUT, v. a. To eviccerate; to draw; to exenterate. —The fishermen save the most part of their fish:

Some are gutted, split, powdered, and dried. Careus.

To plunder of their contents:

In Nero's arbitrary time,
When virtue was a guilt, and wealth a crime,
A troop of cut-throat guards were sent to seize
The rich men's goods, and gut their palaces. Dryden.

GUT-TIE, f. A dangerous disease to which oxen and male calves are rendered liable by an improper mode of castration. In many places the breeders of cattle, when they castrate their calves, take hold of the testicles with their teeth, and tear them out with violence; by which means all the connecting vessels are ruptured. The vasa deferentia, entering by the holes of the transverse and oblique muscles into the abdomen, pass over the ureters in acute angles; at which place they are ruptured, the testicles separated, and the contained substances of the testicles, bladder, kidneys, or intestines; all of which remain covered or attached to the peritoneum, or lining of the abdomen of the beast, which renders it impossible that there should ever be a stricture or tie of the peritoneum, to which it was united, where the rupture happened. There the bow of the gut hangs over the bow of the vasa deferentia, which, by a sudden motion or turn of the beast, forms a hing or tie of the firing round the bow of the gut; the wound, filled with air, is similar to what a carter makes on his pack-saddle. This causes the intestines to fall out of the abdomen into the cavity of the body, and brings on a mortification, which, in two days, or at most, proves fatal. And to this accident the beast, when castrated as above, liable from the day that he was castrated till the time of his being slaughtered.

The symptoms of the gut-tie are the same as those of an incurable colic, sepsis, or mortification of the bowels. The beast affected with this complaint will kick at its belly, lie down, and groan; it has also a total stoppage in its bowels, (except blood and mucus, which it will void in large quantities,) and a violent fever, &c. To distinguish with certainty the gut-tie from the colic, the hand and arm of the operator must be oiled, and introduced into the anus, through the rectum, beyond the os pubis, turning the hand down to the transverse and oblique muscles, where the vessels of the testicles enter the abdomen. There the firing will be found united to the muscles, and is easily traced to the fricture by the hand, without pain to the beast.

From the general view of the agriculture of the country of Hereford, drawn up by Mr. Clark of Buitli, Breconshire, we learn that Mr. Norris, farmer at Whitton, near Leominster, had been uncommonly successful in the cure of the gut-tie. That gentleman informs us, that he had cut cattle for this disease from the age of three months to that of nine years; and, as it is a matter of great importance, we shallstate his method of operating in his own words.

"The only method of cure (says he) that can be safely ventured upon is, to make a perpendicular incision, four inches under the third vertebra of the loins, on the left side, over the pouch or stomatch, and introduce the arm to find the part affected; if possible keep your knife as far as possible from the inflamed bowels by the help of proper assistants. The knife I make use of to sever the firing is in the form of a large fish-hook, with an edge on the concave side, and is fixed to a ring, which fits the middle finger, which finger crooks round the back of the knife, the end of the thumb being placed on its edge. The instrument, by being thus held in the hand, is fixed from turning the surrounding intestines; with it I divide the firing or frings, and bring out one or both, as circumstances require. Here it is to be observed, that great care must be taken by the operator not to wound or divide the ureters, which would be certain death. I thenew up the divided lips of the peritoneum very close, with a surgeon's needle threaded with strong thread, eight or ten double, sufficiently waxed; I also freeze the lip, leaving a vacancy at the top and bottom of the wound sufficiently wide to introduce a tent of surgeon's tow, spread with common digestive and traumatic balsam; covering the incision with a plaster made of the whites of eggs and wheat flour. The wound, thus treated, and dressed every day, will be well in a fortnight. The morse, I give to remove the stoppage in the three stools, and to carry off the fever, four ounces of Glareus's salt, two ounces of cream of tartar, and one ounce of fem, infused in two pounds of boiling water, adding half a pound of olive-oil, and working it off with plenty of gruel, mixed with a large quantity of infusion of mallows and elder-bark. I add to the gruel a little powdered frankincense, in order to vary it, or for the sake of its smell, in order to prevent their bleeding, as in the common way of cutting colts. This method can never displace the vessels of the testicles, bladder, kidneys, or intestines; all of which remain covered or attached to the peritoneum, or lining of the abdomen of the beast, which renders it impossible that there should even be a fricture or tie of the gut."

GUTA, a town of Hungary, in the island of Schist, near the conflux of the Waag and the Danube, seven miles north from Comorn, and thirty south-east from Preburg.

GUTENTAG, or D'brodieu, a town of Silefia, in the principality of Oppeln.

GUTENZELL, or Gutfenzell, a cistercian abbey of Germany, in the circle of Swabia, founded in 1120, whose abbess was a princess of the empire, and had a seat on the imperial bench. The Roman month was ten florins; and the tax thirteen rix-dollars forty-fix kreuzers: twelve miles south of Ulm, and ten east of Bibergech.

GUTERA, a town of Sicily, in the valley of Mazara: twenty miles north of Girgenti.

GUTHALUS, or Guthalus, in ancient geography, supposed to be the Viadurus of Ptolemy. Now the Oder; which rising in Moravia, runs through Silefia, Brandenburg, and Pomerania, into the Baltic.

GUTHILAC, St. [of Gwir, Sax. war, and lac, a victim; of the hardened, or main in the war.] An English Saxon monk, in honour of whom Athenstield, king of the Mercii, built the stately abbey of Crowland in Lincolnshire.

GUTIRE'MION, [of guarfel, C. Br. a reproach, and eftiva,
GUTTA, s. [γυττα from γυτον to pour out.] A drop. The apoplexy was so named, from a notion that it was caused by a drop of blood falling from the brain upon the heart. Some deceases are so named which resemble drops of a thing, as gutta peronae, a drop upon the eye, gutta contusa, the rosy drop or pimples upon the face of hard drinkers.

GUTTA, f. in botany. See CAMPOGIA.

GUTTATE, adj. [from gutta, Lat. a drop.] Be sprinkled with drops; bedappled.

GUTTENBERG, a town of Germany, in the duchy of Stiria; eight miles north-north east of Graz.

GUTTENBERG (John), named also GENSSELEICH in SULZ, generally considered as the inventor of the noble art of printing. His birth is ascribed to Stralsburg, and the year 1400. His family had a house in that city called Zum Gensseleich, and another called Zum Guttenberg; and, as they came to Mentz from a village named Sulgeloch, these circumstances account for the diversity of names given to this celebrated perfomance. In 1456, he entered into partnership, at Stralsburg, with Andrew Dreyzehn and some others; which led to a long and vexatious litigation. The characters which Guttenberg employed were cut out in wood. Speakle faw them in the sixteenth century; they had a hole in the side, fo that they could be filed on a firing. It likewife appears that Guttenberg employed, or attempted to employ, lead characters, mixed perhaps with some alloy; for, in a document respecting the litigation with Schhefter, dated Zum Goenfleisch, and another called Zum Guttenberg, at Mentz, and placed in the school of law, which had formerly been the house called Zum Guttenberg; and, as they came to Mentz from a village named Sulgeloch, these circumstances account for the diversity of names given to this celebrated perfomance. In 1456, he entered into partnership, at Stralsburg, with Andrew Dreyzehn and some others; which led to a long and vexatious litigation. The characters which Guttenberg employed were cut out in wood. GUY

GUTTENHIAAG, a town of Germany, in the duchy of Stria: seven miles north of Pettaw.

GUTTENSTEIN, a town of Germany, in the archduchy of Austria: ten miles south-west of Baden.

GUTTER, f. [from gutter, a throat, Lat.] A passage for water, a channel cut in the gutter or angle of a roof. The cramp. A convulsion or epilepsy. To guttler, v. a. To cut in small hollows.—My cheeks are gutter'd with my fretting tears. Sandys.

GUTTERLEDGE, f. A sea term; a crofs bar laid along over the hatchway.

GUTTEKLIKTZ, a town of Germany, in the circle of Upper Saxony, and circle of Neuland: one mile north-north-west of Auma.

GUTTEN, a narrow flooring, wall'd, and tild. Firft in a place, by nature dole, they build in the gutter or angle of a roof. Quarts, crams, and gullas, and in his own defence. Dryden.

GUTTETTA, [from gutta, Fr. the crap.], The cramp. A convulsion or epilepsy. To guttette, v. a. [from gut.] To feed luxuriously; to gormandife. A low word:—His jolly brother, opposite in fene, Laughs at his thrift; and, lavish of expence, Qualls, crams, and guttus, in his own defence. Dryden.

To guttle, v. a. To scullow. A low word.—The fool did spit in his porridge, to try if they'd hiss: they spat, and scalded his chops. L'Eclrange.

GUTTNER, f. A greedy eater.

GUTTSTADT, a town of Prufia, in the province of Ermeland: forty-four miles south of Konigberg.

GUTTULOUS, adj. [from guttula, Lat.] In the form of a small drop.—Ice is plain upon the surface of the water, but round in hail, which is also a glaciation, and figured in its guttulos defcent from the air. Brown.

Guttural, adj. [gutturalis, Lat.] Pronounced with the throat; belonging to the throat:—In attempting to pronounce the nasals, and some of the vowels spiritually, the throat is brought to labour, and makes that which we call a guttural pronunciation. Holder.

GUTTURALNESS, f. The quality of being guttural.

GUTZKOW, a town of Germany, in the circle of Upper Saxony, in Anterior Pomerania: twenty-four miles south of Stralund, and nine south of Greifswalde.

GUUL, a river of Norway, which runs into Drontheim.

GUY (Thomas), an eminent bookfeller, founder of that excellent charity the hospital for fick and lame in Southwark, bearing his name. He was put apprentice, in 1661, to a bookfeller; and set up trade in the house that forms the angle between Cornhill and Lombard-street. The English Bibles being at that time very badly printed, Mr. Guy engaged with others in a scheme for printing them in Holland, and importing them; but this being put a stop to, he contracted with the university of Oxford for their privilege of printing them, and carried on a great trade for many years to considerable advantage. The bulk of his fortune, however, was acquired by purchasing seamen's tickets during queen Anne's wars, and by South-Sea stock in the memorable year 1720. In 1707 he built and furnished three wards on the north side of the outer court of St. Thomas's Hospital in Southwark, and gave rool to it annually for eight years succeeding the erection of his own hospital, and some time before his death, he erected the flately iron-gate, with the large houses on each side, at the expense of about 9000l. He was seventy-six years of age when he formed the design of building the hospital contiguous to that of St. Thomas, which bears his name, and lived to see it roofed in: dying in 1724. The charge of erecting this vast pile amounted to 18,791l. and he left 29,499l. to endow it; a much larger fund than had ever been dedicated to charitable uses in this kingdom by one man. His library at Tamworth in Staffordshire, (the place of his mother's nativity, and for which he was representative in parliament,) for fourteen poor men and women; and for their pensions, as well as for the putting out poor children apprentices, bequeathed 153l. a-year. Lastly, he bequeathed 1000l. to every one who could prove themselves in any degree related to him.

GUY, f. [from guide.] A rope used to lift any thing into the ship. Skinner.

To GUY, v. a. To guide. Obsole.-He follow'd him, that did him lead and guy. Fairfax.

GUYARD (Anthony), a French benedictine monk, of the congregation of St. Maur, born at Sanulit, in the diocese of Autun, in 1624, and died at Dijon in 1719. He was the author of, Political Observations on the Administration of Beneves, 8vo. and a Differtation on the Fees for Mafles, 1748, 8vo. which are said to be distinguished by much profound research, gratifying to the curiosity of students in ecclesiastical antiquities.

GUYAUX (John-Joseph), a learned professor at Louvain, born in a vilage of Hainaut, at Brabant, in 1684. He appears to have been educated at the university of Louvain, where he was appointed professor of the sacred Sciences in 1733; created doctor of divinity, and canon of St. Peter's, in 1727; and afterwards chosen dean and provost of that collegiate church. He died in 1772. He was the author of, 1. Praelectiones de S. Jeifti Christi Evangelio, deque Alis et Epiftolis Apostolorum, 7 vols. 8vo. 2. Commentarius in Apocalypsum, 8vo. 3. Quaestio Magnifico-theologica de Eju Carnium, 1749, 4to. 8c.

GUYEN, a town and castle of Germany, in the circle of Franconia, and principality of Anfach: twenty-nine miles south-east of Anfach.

GUYET (Charles), a learned French Jesuit, born at Tours, in 1602. He entered into the society when he was about twenty years of age, and after spending through the usual course of studies, was appointed to teach the belles-lettres, and moral theology, at the seminary belonging to his order, in his native city. Afterwards he more particularly devoted himself to the service of the pulpit, and the study of the rites and ceremonies of the church. He died in 1664. He was the author of, Ordo Sacrorum Missae et Perpetuum Divini Officii, 1672, 8vo. and Hortologia, five de Felix proprioi Lovain, 1725, a large folio volume, full of erudition, and of curious and interesting matter for the ecclesiastical antiquarian.

To GUYLE, v. a. To beguile:

For who wot's not, that woman's subtleties Can guyle thy Argus.

GUYON (Johanna Bouvieres de la Mothe), born at Montargis in 1648. Her parents, making a high profession of piety in the Romifh religion, (especially her father,) were the more solicitous for her early initiation into the mysteries of that church; and for which reason they guarded her tender years by confining her education to some of the religious of the Ursulines and Benevices. In the course of her instruction, she gave frequent proofs of a good understanding, as well as some extraordinary symptoms of religious illumination. At the age of only twelve years, she was solicited in marriage by several; but her father would not then listen to any proposals of the fort; and her mind being diffped towards reading and meditation, she indulged herself therein. On the demise of her institution, she gave great satisfaction in the performance of her religious duties, she wished to devote herself wholly thereto, and take the veil; but her father not approving thereof, she relinquished it; and at sixteen, in submission to his authority, was married to M. Guyon, a gentleman of
of rank and fashion at Paris, by whom she was intro-
duced into the highest circles of society. But her life had
been twenty years older than herself; being much af-
associated with the court, and being herself
reasonably of a tender and affectionate disposition, she
thought it her duty to attend very closely upon him, al-
though she was thereby much secluded from society.
This, however, afforded her a favourable opportunity
of indulging in reading and meditation, which she re-
lished with ardour; but could not find that solid peace
from within, because she was seeking from without, what is only
to find within; advising her to seek God in her
own heart, and she would find him there.

These expressions had a powerful effect on her mind,
and from that time she found the practice of prayer
more easy; and, as she herself, "often experienced
the love of God to abound in her heart, as to draw
and absorb the powers of her soul into profound medi-
tation, without act or discourse." Soon after this, she
herself that which greatly increased her desire for
beauty; but considering this affliction as a release from
every temptation to earthly vanity on account of supe-
rior personal charms, she finally rejoiced at it. M.
Guyon dying on July 21, 1676, she was left a widow
at the age of twenty-eight, with a son and two daugh-
ters, the care and concern for whose education pre-
vented her from engaging into the court; and was then
released from the court; and was then
removed to Vaugirard, and at
length to the Bastille. During her confinement she un-
derwent several examinations; and her writings were
condemned by the archbishop of Paris. After several
months confinement, she was at the pleasure of the king,
released from prison, and banished to Blois, where she
lived near twelve years, and was then
released at length in October 1685, and was then
forbidden from returning to Paris, and was then
removed to Bois-le-Duc, and then to
length to the Bastille. During her confinement she un-
derwent several examinations; and her writings were
condemned by the archbishop of Paris. After several
months confinement, she was at the pleasure of the king,
released from prison, and banished to Blois, where she
lived near twelve years, and was then
released at length in October 1685, and was then
forbidden from returning to Paris, and was then
removed to Bois-le-Duc, and then to
length to the Bastille. During her confinement she un-
derwent several examinations; and her writings were
condemned by the archbishop of Paris. After several
months confinement, she was at the pleasure of the king,
released from prison, and banished to Blois, where she
lived near twelve years, and was then
released at length in October 1685, and was then
forbidden from returning to Paris, and was then
removed to Bois-le-Duc, and then to
shells, and inlay them very curiously. They also make beautiful inkstands, and small boxes. They manufacture gold and silver fluffs, velvets, &c. and they imitate the forms of Tofts, and Persians, and Europeans. They also make very good swords, jemidors, kewpwards, and bows and arrows. Here is likewise carried on a traffic in precious stones, and silver in great quantities is brought hither from Iraq." It is chiefly supplied by the Poona Marhattas. The inhabitants are Hindoos, and follow the worship of the Brahmins. Here are also Moguls, Arabsians, Persians, Armenians, and Europeans.

Great part of this country was conquered by the English under the command of general Goddard, but restored to the Mahrattas, soon after the war with Hyder Ali. Amedabad is the capital.

GUZNOORGUL, a province of Asia, in the Kuttore country.

To G U Z Z L E, v.t. [from gut, or guf, to gulte, or gufle.] To gormandize; to feed immoderately; to swallow any liquor greedily. — They fell to lapping and guzzling, till they burst themselves. L'Estrange.

Well-fedon't bowls the goofy's spirits raise, Who while the guzzles chats the doctor's praise. Reesomn.

No more her care shall fill the hollow tray, To sat the guzzling hogs with floods of whey. Gay.

To G U Z Z L E, v.t. To swallow with immoderate guft:

The Pylian king Was longest liv'd of any two-legg'd thing, Still guzzling must of wine. Dryden.

G U Z Z L E R, f. A gormandiser; an immoderate eater or drinker.

G W A B R MERCHED, f. [Welch.] A payment or fine made to the lords of some manors, upon the marriage of their tenants' daughters; or otherwise, upon their committing the act of incontinency.

G WA L I O R, a strong fortreß of Hindoostan, in the circle of Gohud, situated on a vaft rock, about four miles in length, but narrow, and nearly flat at the top; the height from the plain below, two or three hundred feet almost perpendicular, the rampart conforming to the edge of the precipice all round; the only entrance by steeples running up the side of the rock. This fortres was taken by general Popham by parfuree in the month of August, 1793. The town is situated at the foot of the hill, and was large, but well built, with a number of magnificent edifices, and the whole surrounded with a wall: sixty miles south of Agra, and one hundred and fifty west-south-west of Lucknow. Lat. 26° 15', N. lon. 78° 28'. E. Greenwich.

G W A L S T O W, f. [an old word, from the Saxon Alpal, the gallows, and Etop, a place.] The place where malefactors are executed. Scott.

G W A Y, f. That which had been stolen and afterwards dropped in the highway for fear of a discovery, which was forfeited to the king or the lord of the manor. An old word.

G W E G E R, a river which runs into the sea on the north coast of the island of Anglesea.

G W E N T O W, or G W E N N O W, a river of North Wales, which runs into the sea about four miles south from Caernarvon.

G W E N D R A T H V A G, a river of Wales, in the county of Caermarthen, which runs into the sea a little below Kidwelly.

G W E N D R A T H V A U R E, a river of Wales, which runs into the sea a little below Kidwelly.

G Y B E R, or G Y L Y N, a river of North Wales, which passes by Wrexham.

G Y E T H R I C K, a river of South Wales, which runs into the Towy, near Llanymrhedyn, in Caermarthenshire.

G W I L Y, a river of South Wales, which runs into the Towy near Caermarthen.

G W I L Y M (Daftyd ap), a celebrated Welsh poet of the fourteenth century, called, by way of pre-eminence, the Welsh Aneurin. Endowed with a fine genius, which he very considerably cultivated; a resident of Wales, he profifed poetry, and Persians, and Europeans. He was longed liv'd of any two-legg'd thing, or otherwise, upon fine made to the lords of some manors, upon the marriage of their tenants' daughters; or otherwise, upon their committing the act of incontinency. Bola, having in the meantime contrived to circulate a story of the fame nature in South Wales, of the death of Gryffydd Grug, was much pleased on his return, to find that Daftyd had also written a pathetic elegy on his opponent. He thus succeed according to his expectations; for, on discovering to each the real sentiments of the other, they forgave the folly, and ever afterwards remained firm friends."

The works of this celebrated bard posses harmony, invention, elegance, and perspicuity. The powers of his mind rose greatly superior to all the disadvantages of the period in which he lived. In harmony of verification, his works even now stand as a model of perfection, although, at the time when he wrote, most of the laws of composition were in a state of fluctuation, and others were altogether unknown. It seems, indeed, very probable, that some of his verses might form the idea for many rules which were afterwards settled. He had both feeling and judgment; in his love-poems there is a peculiar softness and melody in all their variations; and this, in a greater or lesser degree, may be traced through all his writings, from the slightest efforts of his muse, to the most grand and sublime parts of his imagery.

G W Y N E, a river of South Wales, which runs into the sea near Ffard, in Pembroke-shire.

G W Y T H E L, a river which rises in the county of Radnor, and runs into the Arrow, near Kyneton, in Staffordshire.

G Y, a town of France, in the department of the Upper Saone, and chief place of a canton, in the district of Gray: six leagues south-west of Vouf, and three east of Gray.

G Y A L G U R, See GAWILL.

G Y A R M A T H, a town of Hungary, twenty miles east-north-east of Lendava, which runs into the sea about four miles south from Cemariro.

G Y A R U S, in ancient geography, one of the Cyclades, twelve miles in compass, lying to the east of Delos. It was a defert island, and allotted for a place of banishment by the Romans.

G Y B E, f. [See GIBE.] A sneer; a taunt; a farce—Ready in gybes, quick-ans wer'd, saucy, and as quarrellous as the weasel. Shakespeare.

To G Y B E, v.t. To sneer at a person:

The vulgar yield an open ear,
And common courtiers love to gybe and sneer. Spenser.

G Y E Y, a town of France, in the department of the Upper Maione, and chief place of a canton, in the district of Langres: four leagues north-west of Langres.
GYGES, or GYES, a son of Cælius and Terra, represented as having a hundred hands. He, with his brothers, fought in the war against the Greeks, and was accepted in Tartarus. Ovid, Trist. 4, c. 7, v. 18.—A Lydian, to whom Candaules, king of the country, showed his wife naked. The queen was so incensed at this inhumanity of imprudence and immorality in her husband, that she ordered Gyges, either to prepare for death himself, or to murder Candaules. He chose the latter, and, punished the queen, who, after the death of his wife, lived about 275 years before the Christian era. He was the first of the Mermnades, who reigned in Lydia. He reigned thirty-eight years, and distinguished himself by the immense presents which he made to the oracle of Delphi. Herodot. i, c. 8. According to Plato, Gyges defended a city in the earth, where he found a braced horse, whose legs he opened, and, finding within the body of the carcass of a man of uncommon size, from whose whole finger he took a braced ring. This ring, when put on his finger, rendered him invisible: and by means of its virtue, he introduced himself to the queen, murdered her husband and married her, and usurped the crown of Lydia. Ge. Office, 3, 9.—A man killed by Turnus, in his wars with Theseus. Virg. En. 9, v. 762.—A beautiful boy of Cnidus, in the age of Horace. Horat. 2, Od. 5, v. 30.

GYGÆUS, called also COLOUS; in ancient geography, a lake of Lydia, distant forty stadia, or five miles, from Sardis.

GYKOW, a town of Germany, in the duchy of Holstein; ten miles west of Lutkenborg.

GYLIPUS, a famous Lacedaemonian commander, son of Clisthenes, who defeated the Athenians before Syracuse. See the article GRECIA, vol. viii. p. 582-5.

GYLPUT, f. The name of a court held every third day in the liberty or hundred of Pathbaw in the county of Warwick. Inquis. 13 Edw. III.

GYMNANDRA, f. in botany. See BARTSIA.

GYMNANTHES, f. [Greek; having naked flowers.] In botany, a genus of the class monocoea, order madeldaphia. The generic characters are—1. Male flowers. Calyx: ament compound, with pediciles tripartite, united, with the various, anther-bearing. Corolla: none. Stamina: filaments as many as or pedicels, often tinged, and sometimes, scattered, placed on every side of the ament, very short, deciduous; anthers oblong, minute, three-celled. II. Female flowers on the same or a different frutilus, or frulleta. Calyx: perianthium none, but one or two scales at the base of the ament. Corolla: one. Pistillum: germ roundish, superior, style scarcely any, or very short, three-cornered; frugites three, linear, acute, channelled, reflex. Pericarpium: capsule trilococcous, three-celled, three-valved. Seeds: solitary, roundish.—Effcntia Charadeci, Male. ament, naked; perianthium and corolla, none; stigma, pediciles three-parted or three-forked, anther-bearing. Female: ament or germ, pedicel, corolla, none; style, trilococcous, three-celled. Seeds: solitary. Species. 1. Gymnanthes elliptica, or elliptic gymnath. dioicous; flaves three-parted, females amentaceous. 2. Gymnanthes lucida, or lucid gymnath. monocoea; flaves trilococcous; females solitary, pedicel. These fruits were found by Swartz in the West Indies; the first in Jamaica, the second in Hispaniola.

GYMNA/SIRACH, f. In antiquity, the director of the gymnafs. He had two deputies under him; the one called xypharch, who presided over the theatres, and was the umpire in wrestling; the other was gymnafhi, who had the direction of all the other exercises.

GYMNA/SIUM, f. In Grecian antiquity, a place set apart for performing exercises of the body. The word is Greek, formed of γυναικειος, naked; because they put off their clothes, to practice with the greater agility. The gymnafs, according to Pottier, was a gymnasia, a place where the Lacedemonians, but were afterwards very common in all parts of Greece; and very much augmented and improved at Rome. There were three principal gymnasia at Athens; the Academy, where Plato taught; the Lyceum, noted for Ariciottus's lectures; and the Cyno-fargs, allotted for the populace.

GYNUMSTUS, or GYNUMSTES, a man, in whom Herodotus scientifically describes the structure and form of the ancient gymnasia, lib. v. c. 11. They were called gymnæa, because several of the exercises were performed naked; and palaestra, from wrestling, which was one of the most usual exercises there. The Romans sometimes also called them thermae, because the baths and bagnoes made a principal part of the building. It appears that they did not perform their exercises quite naked to caud, as the time of Homer, but always in drawers; which they did not lay aside before the thirty-second Olympiad. Orpippus is said to have been the first who introduced that indecent practice: for having been worsted by his drawers entangling him, he threw them off, and the rest imitated him. The gymnasia were not sngle edifices, but a number of distinct buildings, connected, and sufficiently tenacent, capable of accommodating thousands of people at once; having parts defined for philosophers, rhetoricians, and the professors of other sciences, to read their lectures; and for wrestlers, dancers, and all who chose to enter the lists for exercise; at the same time without the least disturbance or interruption. The buildings consisted of a great many parts. There were the exterior porches, where the philosophers, rhetoricians, mathematicians, physicians, and other virtuous, read public lectures, and where they also disputed and rehearsed their performances. 2. The ephebeum, where the youth assembled very early, to learn their exercises in private, without any spectators. 3. The corceum, or corcidium, or kind of gymnasium, where they stripped, either to bathe or exercise. 4. The eulaes-thumbnail, alias thermæ, appointed for theuncti, in a mixture of oil and sweat. 5. The cosnferium or conuifanum, in which they covered themselves with a blanket, to dry up the oil or sweat. 6. The paleastra, properly so called, where they practised wrestling, fencing, boxing, pugilism, pankration, and other similar exercises. 7. The sphæristium or tennis-court, reserved for exercises wherein they used balls. 8. Large unpaid stadia, which comprehended the space between the patacics and the walls wherewith the edifice was surrounded. 9. The xyphium, which were porticos for the wrestlers in winter, or bad weather. 10. Other xyphilis or open stadia, allotted for summer and fine weather, some of which were quite open, and others planted with trees. 11. The baths, consisting of several different apartments. 12. The stadium, a large space of a semicircular form, covered with sand, and surrounded with seats for the spectators.

For the administration of the gymnasia, there were different officers: the principal were, 1. The gymnasiarch, who was the director and superintendent of the whole. 2. The xypharch, who presided in the xyphium, or stadium. 3. The gymnastes, or master of the exercises, who understood their different effects, and could accommodate them to the different complexions of the athlete. 4. The pedotribus, whose business was to teach the exercises. The gymnastic exercises may be reduced to two general classes, as they depend either on the action of the body alone, or as they require external agents or instruments. The latter consisted chiefly in mounting the horse, driving the chariot, and swimming. The former were chiefly of two kinds; orcheftic, and pankromatic. The orcheftic comprehended, 1. Dancing, 2. Cubif pinnacle,
Cubittic, or the art of tumbling, 3, Sphérificns, the palasftrice comprifed all exercifes under the deno¬
nominated by the Greeks which confisted in
the exercife of the javelin, and that of the hoop, de¬
ftrength and skill were requifite in directing this hoop,
ates fifty-five forts of exercifes that were prafticed in
dating. 3. Holding the breath. Hoffman enumer¬
the gymnafia, as the fources or foundation of health
as well as arms; and yet your modern footmen
Cretans wifely forbid their fervants

in the Memoirs of the Royal Academy of In-
recrues, men, being apprifed of the neceflity of mili-
to the different complexions, ages, and fexes,
Baleares near the Iberus in the Mediterranean, called Bahares by the Greeks. Plutarch.
GYMNETES, a people of Ethiopia, who lived al¬
molt naked. Pliny.
GYMNETRUS, f. the bare-breech, in ichthyo-
gy-mnastically, adv. Athletically; fitly for
strong exercife.—Such as with agility and vigour are
not gymnastically composèd, nor actively ufe thofe parts.
Brobdingngniss.
GYMNAS'TIC, adj. [Gymnásia, Gr. gymnāsía, Fr.] Pertaining to athletic exercife; confifting of leaping,
GYMNAS'TICS, s. The art of performing exercifes of the body, whether for defence, health, or di-
—The Cretans wifely forbid their fervants
gymnasically exercife themfelves daily, whild their enervated lords
in the Memoirs of the Royal Academy of In-
scription, which is the earlied record of the Grecian
was reprefented as of the ufual form in the gene-
year. Its length was eight feet fix inches, its breadth
in the wideft part ten inches and a half, and its thick-
in the year 1798, that a fpecimen of this fìsh was thrown on the
fpecimen was wanting.—the colours the fame as in the
forme a fingle filament: at fome little diftance beyond
gradually coalesce in their progrefs till at length they
‘the tail, which confiftsof a lanceolate membrane ftrength¬
to fay whether he mentions under the name of regaleus, be the fame we are refering to.
Cepede makes the regaleus a definite genus, which he
places among the apodes, as he says it has no ventral
fins, and two dorsals. We have thought better to in-
clude them in one article.

1. Gymnetrus Hawkini, the Blochian gymnetrus: blufh-silver, with oblique, linear, brown, bands, and
rounded spots, red fins, and four ventral procifes.
This, which is a native of the Indian seas, and which
appears alfo to be occalionally feen in thofe of Europe,
is defcribed by Dr. Bloch, from a drawing communi-
cated by J. Hawkins, efq. It appears to be furnifh
with two pair of ventral procifes, which are of confider-
able length, and terminate in large, dilated, finny,
and the tail, which, in the figure given by Dr.
Brobdingngniss, is reprefented as of the uñual form in the gene-
rality of fìshes; a circcumstance now known to be owing
to a miftake of the draughtfman. The colour of this
species is filver, with a blufh caft on the upper parts,
and feveral tranfierce, alternate, brownfih, lades con-
tinued, covered with brownfih bands. This, which
nears only two inches and three quarters; the tail in this
ions, hopes, one day, of being proclaimed and crowned con-
quor in the public games; which was the highest hon¬
our any mortal could arrive at: even Philip, king of
Macedon, valued himfelf more highly on being pro-
claimed victor at the Olympic games, than upon all the
victories he had obtained over his enemies. See the ar-
ticle Hero of Sparta.

Though it be impoffible to determine the precise
epocha of the gymnastic art, yet it appears from feve-
rall paffages in Homer, and particularly the twenty-third
book of the Iliad, where he dcribes the games cele-
brated at the funeral of Patroclus, that it was not un-
known at the time of the Trojan war. From that de-
cription, which is the earliest record of the Grecian
gymnastics, it appears, that they had chariots-races,
boxing, wrefling, foot-races, gladiators, throwing the
difcus, drawing the bow, and hurling the javelin; and
it fhould seem, from the particular account Homer gives
of thefe exercifes, that even then the gymnastic art
wanted little of perfection; fo that when Galen fays
there was no gymnastic art in Homer's days, and that it
began to appear no earlier than Plato, he is to be un-
derfood of medicinal gymnastics only; which had their
rise later; becaufe, while men continued sober and la¬
bious, they had no induc tion for medical art; but
when luxury and idlenefs had reduced them to the fiad
necffity of applying to physicians, thefe, who had
found that nothing contributed fo much to the prefa-
ervation and re-eftablifhment of health, as exercife pro-
portioned to the different complexxions, ages, and fexes,
of their patients, did not fail to refer them to the prac-
tice of gymnastics.

GYMNETRIE, in ancient geography, two iflands
near the Iberus in the Mediterranean, called Bahares by the Greeks. Plutarch.

Gymnetrus, a people of Ethiopia, who lived almofl naked. Pliny.
Gymnastics, s. The art of performing exercifes of the body, whether for defence, health, or diversion.
—The Cretans wisely forbid their servants gymnastically exercife themselves daily, while their enervated lords
gymnastics as well as arms; and yet your modern footmen
gymnastics exercife themselves daily, while their enervated lords
are softly lolling in their chariots. Abatonem.
M. Burette has judiciously given the history of gym-
astics in the Memoirs of the Royal Academy of In-
scriptions. On the first establishment of society, he ob-
serves, men, being apprised of the necessity of military
exercifes, for repelling the intruits of their neigh-
bours, instituted games and proposed prizes, to animate
their youth to combats of various kinds. And as run-
ning, leaping, dexterity in throwing the javelin, in
driving a ball, or tossing a quoit, together with wreath-
ing, &c. were exercifes fuit to the scientific fience of thofe days; so the youth vied to excel in them, in the
preference of the aged, who fat as their judges, and dis-
penced prizes to the conquerors; till what was origi-
inally an amusement, became at length a matter of fuch
importance, as to interef great cities and entire nations in its practice. Hence arose an emulation to excel, in
hopes, one day, of being proclaimed and crowned con-
quor in the public games; which was the highest hon¬
our any mortal could arrive at: even Philip, king of
Macedon, valued himself more highly on being pro-
claimed victor at the Olympic games, than upon all the
victories he had obtained over his enemies. See the ar-
ticle Hero of Sparta.

Though it be impoffible to determine the precise
epocha of the gymnastic art, yet it appears from feve-
rall paffages in Homer, and particularly the twenty-third
book of the Iliad, where he describes the games cele-
brated at the funeral of Patroclus, that it was not un-
known at the time of the Trojan war. From that de-
cription, which is the earliest record of the Grecian
gymnastics, it appears, that they had chariots-races,
boxing, wrefling, foot-races, gladiators, throwing the
disetus, drawing the bow, and hurling the javelin; and
it fhould seem, from the particular account Homer gives
of thefe exercifes, that even then the gymnastic art
wanted little of perfection; fo that when Galen fays
there was no gymnastic art in Homer's days, and that it
began to appear no earlier than Plato, he is to be un-
derfood of medicinal gymnastics only; which had their
rise later; becaufe, while men continued sober and la¬
bious, they had no induc tion for medical art; but
when luxury and idlenefs had reduced them to the fiad
necffity of applying to physicians, thefe, who had
found that nothing contributed fo much to the prefa-
ervation and re-eftablifhment of health, as exercife pro-
portioned to the different complexxions, ages, and fexes,
of their patients, did not fail to refer them to the prac-
tice of gymnastics.
GYMNETRUS.
above specimen, which was taken near Visagapatam in the year 1788, was two feet eight inches from head to tail. From Dr. Raffles's memorandum on this subject, politely communicated to Dr. Shaw, it appears that no teeth were visible in either jaw; the opercula consisted of two oblong, flexible, streaked, plates; the abdomen was very short, and the vent placed near the head; the caudal fin was not united with the dorsal, and consisted of four rays, connected at the base by a thin membrane, and afterwards joined together and ending in a fleshy thread. The gill-membrane had five rays; the dorsal fin 320; the pectoral fin had fourteen rays, the ventral two, and the caudal four.

In the British Museum is a dried specimen of a fish which appears to be nearly allied to this, but which is not sufficiently perfect to admit of very exact description; the body is much shorter in proportion; the lateral line extremely strong or distinct; the colour of the whole animal, except the fins and processes, which are red, a bright silver; and from the top of the head proceeds a very strong horn-shaped process of the length of several inches, gradually tapering into a slender extremity.

The length of this specimen is about four feet and a half, and the breadth about five inches, exclusive of the back fin.

3. Gymnurus lanceolatus, the Cepedian gymnurus. This, which must be considered as a doubtful species, is described by Cepede from a coloured Chinese drawing belonging to that gentleman's museum.

The author refers it to the present genus from the circumstance of its wanting the anal fin, and gives it the trivial name of lanceolatus from the shape of its tail, which is pointed at the tip. This fish is of a gold colour, shaded with brown, and is destitute of the ventral fins or appendages so remarkable in the other species.

4. Gymnurus Africana, the African gymnurus: yellow; spoted longitudinally with brown points, and with the ventral cirri dilated at the tips. This extraordinary fish seems to have been almost unknown till within the space of a few years past; nor are its characters and history yet so distinctly ascertained as might be wished. It is a native of the northern seas, and seems to have been first described by professor Africanius, in his work entitled, Icones rerum naturalium, &c.

The length of the specimen was ten feet, and the diameter, which was equal throughout the whole length, about six inches; the head short, the mouth small, and the eyes rather large; on the upper part of the head, before the commencement of the dorsal fin, there were several spots; the plant naked rays or processes, of moderate length; the dorsal fin, which was rather shallow, commenced at a small distance below the head, and running along the whole length of the back, formed by its continuation the tail-fin, which was carried to a very small distance beneath the body, there being properly speaking, no vent-fin; the pectoral fins were very small, of a slightly ovate or rounded shape, and situated at a small distance from the head; the ventral fins, if they can be said to be of the name, consisted of a pair of extremely long fimple rays or processes, terminated by a small expanded tip, or thin extremity; the gill-covers appeared to consist of five or six radiated laminae; the colour of the whole body was bright silver, with a bluish cast diffused over the upper part of the head; the lateral line was strongly marked, and ran from the gill-covers to the tail; and the scales of the body were marked by several longitudinal double rows of slightly-extend, very small, dull, specks; the forepart of the body, the fins pale brown. This fish is said to be generally seen either preceding or accompanying the shoals of herrings in the northern seas, for which reason it is popularly known by the title of king of the herrings.

GYMNIAE, in ancient geography, a town of Colchis.

Vol. IX. No. 572.
late, pointed, flat, entire, scattered; capsule oblong, truncate.
4. Gymnotus obtusum: leaves oblong, lanceolate, pointed, entire, a little concave and erect; capsule ovoid-oblung, with a pubescent lid.
5. Gymnotus ovatum: leaves ovate, obtuse with a point; capule rounded; lid without point.
6. Gymnotus ofimandacum: stem naked at the base; leaves lanceolate, entire, two-rowed; capsule roundish; lid without point.
7. Gymnotus Gryphithianum: leaves spatulate, very obtuse, a little fleshy; capsule obovate; lid without point; peduncle thickened upwards, a little curved.
8. Gymnotus aurigeminum: stem pubescent; leaves subulate, imbricate, carinate, entire; capsule campanulate.
9. Gymnotus lutelom: stem branched; leaves lanceolate, carinate, concave; capsule oblong; lid hemispherical, with a short point.
10. Gymnotus curvirostum: stem branched; leaves linear-oblong, with a subulate lid.
11. Gymnotus sternigerum: stem branched; leaves linear, spread; upper ones flatter; capsule hemispherical; lid oblique; peduncle twisted.
12. Gymnotus microphthalmum: leaves linear, spreading, capped when dry; capsule contracted at the mouth; lid with a futilineated beak.
15. Gymnotus lapponicum: stem naked; leaves linear-lanceolate, entire, carinate, spread; capsule truncate, becoming fasiculate.
17. Gymnotus Hemil: leaves broad-lanceolate, pointed, denticulate at top; capsule cylindrical; lid with an oblique beak.

GYMNOTH'ORAX, the Bare-breast, f. A genus of fishes introduced by some late ichthologists, the species of which are incorporated with the Muraena.

GYMNOTUS, f. [γυμνός, Gr. bare-back.] In ichthology, a genus of fishes of the order apodes. The generic character is, back smooth, and without any fin. The body is narrow, long, and thin, somewhat like the blade of a carving-knife. The head is short, rather broader than the body, and armed with a great many little sharp teeth; the tongue is broad, and full of inequalities or warts, as is the palate likewise; there are four small foramina near the edge of the upper jaw. The eyes, which are on the upper surface of the head, are very small; pupil black, iris yellow; and have a membrane to defend them from accidents. There are small capillary apertures all over the body, which exclude a thick mucus, serving the animal instead of scales, and defending the body from wounds. The apertures of the gills are narrow, in an oblique direction, and close to the pectoral fins. The ventral cavity is short; the anus is close under the chin. The lateral line is double, one part along the back, the other near the anal fin. The pectoral fins are small, the anal long, the tail obtuse; the rays of all the fins are flexible and fleshy, but their number cannot be exactly ascertained on account of the thickness of the membrane which covers them. See the Plate, fig. 1.

This extraordinary fish is found in the waters of Guiana, Surinam, Cayenne, Peru, on the shores of the river Senegal.
GYMNOTUS.

1. The electrical Eel. 2. The long tailed Ctenopharynx.
Senegal in Africa, and in general in hot climates; but
it is plentiful also in North America. In New York and
Pennsylvania, it is called *numbing-cat*; and *numbig* in
South Carolina. It delights in clear water, and is fre¬
quently found by places at the mouths of streams; and
thence passes up into rivers and lakes. It comes of¬
ten to the surface to breathe, and then ejects a bubble
of air. It soon dies if it cannot frequently respire the
fresh air, as is the case when caught in a net, or on a
hook at the bottom of the water. The flesh is fat and
well-condensed; that of the back is firm, but full of bone;
that of the belly is soft, and mucilaginous. It is eaten
both by the negroes and the whites. Dr. Garden ob¬
erves, that it is caught in the Surinam river a great
way up, beyond the reach of the tide.

The property of this fish to communicate an electrical
shock, has given great reason excited the attention of
naturalists. Richer, who in 1677 was sent to Cayenne
by the Paris academy to make mathematical and astro¬
nomical observations, first discovered that this eel com¬
municated a considerable shock, whether touched by the
hand, or with a stick, &c. More than forty years el¬
aped, before any thing further to proceed concerning
this was first published in his *Voyage around South
America*, published in 1743, speaks of a fish called
*parague*, found in the river of the Amazonas, which pro¬
duced the same effect: this was doubtless the same fish.
But Mr. Ingram, of Tower-hill, London, in a letter dated
February 1750, gave a clearer description of the elec¬
trical properties of this fish; he conceived it to have an
atmospheric electricity around it; for, as he was about
to touch it with a piece of iron, he received such a strong
shock, without touching it, that he was obliged to drop
the iron he held in his hand.

Gravesande was the first who discovered that the shock
proceeded from electrical matter; he writes from Rio
dejpero, November 22, 1755, that he had known Allemand,
'This fish produces the same effect which I have felt at
your house in touching the Leyden phial; with this dif¬
tinction, that no spark is seen, though the shock is much
stronger; for, if the fish be pretty large, it certainly
knocks down those who touch it, and the shock is felt
through the whole body.' More recent experiments of
Mr. Flagg confirm that the shock from this fish may be
occasionally stronger, and be longer felt, than that from
the electrical phial; he says that a negro who was afraid
to touch a strong one, was at length subdued by a trick
of his companions; he immediately lost the use of both
arms, which he did not recover for some years after¬
ward. Mr. Bryant, however, supposed that the exis¬
tence of the electric matter, as appears from various
academical papers, so late as the year 1762, the writ¬
ers of which attributed the shock to certain muscles
similar to what Reaumur pretended to have discovered
in the torpedo in 1714. But Vander Lott confirmed the
animal electricity of this fish by several experiments;
for he observed, that, by touching it with various me¬
tals, a considerable shock was felt, but none at all when
touched with wax, &c. Fermin went farther; he ob¬
erved that fourteen slaves, holding each other by the
hand, felt the shock at the same time, if the first touched
the fish with a stick, and the last put his hand in the
water. The experiments of Bancroft, and the more re¬
cent ones of Bryant, place the matter past all doubt.
Bryant found that he received a strong shock when he
beared the fish with his hand at the point of a sword, but
none at all when the point of the sword was covered with wax.
He made experiments with glass bottles; he placed the
head of the fish in the bottles, upon the shock was as strong as when the water was upon
the ground; whence he concludes, that the animal muft
have a great portion of electric matter naturally inher¬
ent, or that it is continually renewed by the water it¬
sel. He observed also that the fish would communicate
shocks through the tub it was contained in; for, having
ordered a flame to pour the water out of the tub or ca¬
sk, he received such a shock as occasioned him to let it fall; he then brought another, and the shock was of
a very strong shock. But it must be observed, that this
fish was very large, and recently caught. Dr. Garden
told Dr. Flagg, that some were seen in Surinam river upwards of twenty feet long, whole shock proved infult death
for person that unluckily received it. Mr. Flagg ob¬
erved, that some negroes would touch the electrical
eel without receiving any shock; and he says that a
lady in a hectic fever touched it without effect; and he
concluded that the fever was the cause of her receiv¬
ing no shock; but Bloch rather supposes that the fish was
at that time exhausted, and incapable of giving shocks.

Of other experiments, the most considerable are those of
Williamson at Philadelphia in 1773, and Dr. Garden
at Charleston, in 1774. It would be tedious to brie¬
ve all the minutiae of these experiments. Bloch, after
detailing them at length, draws the following conclu¬
sions: 1. That this fish is capable of communicating
a painful sensation to all creatures that approach it. 2.
That this effect depends on the will of the animal, so
that it may be stronger or weaker, according to the state
of the fish. 3. That the shock or pain which it com¬
municates is not an immediate effect of the motion of
certain muscles in the eel, since it can produce this ef¬
te at a certain distance, and since it may be extended
by means of certain substanices, while other substanices
of equal hardness and tenion will not communicate or
extend the shock. 4. That the shock is the effect of a
fluid matter, emanating from the fish. 5. That this ema¬
nation from the electrical eel has the same effect upon
the human frame as ordinary electricity, and produces
the same sensation; that it kills or stuns animals in the
same manner. Lilby, that all the conductors of ordi¬
ary electricity act similarly upon this, and neither. So
that we may conclude with confidence, that this ani¬
mal is provided with real electric matter. Several ex¬
periments, however, have been made, which seem to
contradict each other. Ingram says he felt the shock
before he touched the water, and Condamine, that he
felt it by touching the water with a stick. The first, on
the contrary, felt no shock when he touched it with a
stick; Vander Lott felt none when he touched it with
lead or tin; and Williamson, Heyden, and a young
negro, could lift the fish out of the water without receiv¬
ing any shock. But these contradictions will be re¬
conciled if we consider the following particulars: 1. That
the fish, when at rest, communicates no shock. 2. That,
when the fish is angry, the shock is the stronger the
more it is touched or irritated. 3. That one recently
cought produces the effect in a much stronger manner
than when it has been long kept. 4. That it communi¬
cates the shock by the intervention of those bodies
which are the conductors of ordinary electricity, but
not by electric bodies. 5. That this fish can communi¬
cate a shock to a certain distance without being touched.
6. If the fish be seized by the back with both hands at
once, and pressed hard, it gives no shock. 7. The fish,
when disordered, produces very light shocks or none at
all; and none when it is dead. 8. It can kill or stun
fishes without touching them directly.

Hence we may conclude with certainty, 1. That the
shock is produced by an electric matter. 2. That the
emanation of this matter depends on the will of the fish,
or on its being in a proper state of health; which have
occasioned the different effects related in various expe¬
riments. 3. That this animal electric matter is still of
a nature different from ordinary electricity. 4. That the
fish produces within itself, as it were, by its own
own exertion, the electric matter, since it no longer exists in those which are sick or dead. 5. That a motion of the muscles is necessary for the emanation of this matter, especially of the muscles of the back; for, when these are kept motionless by squeezing the back, there is no shock. 6. As the torpedo exhibits all these phenomena, they must also arise from a animal electricity; which overruns all the lymphatics which have been imagined for its explanation during two thousand years. This electric property is useful to the fish, both to procure food, and to avoid its enemies. In the first case, it slays the smaller fish, and then devours them before they can recover themselves; in the other, it can slay the larger voracious kinds, and thus gain time to escape. Mr. Harfflin, in his Voyage to Guinea, part i. p. 144, observes, that in those places where the electric eel abounds, there are few or no other fishes to be found; and in those places the negroes and Indians are afraid to bathe.

Though the matter we have brought forward seems to prove the existence of the electric fluid in this animal, yet many naturalists have denied it, because they never could discern any spark. Wallh, who, by his experiments made at Rochelle, proved the existence of electricity in the torpedo, could not produce any spark. Cavendish endeavoured to shew by experiments, that the Leyden phial might give shocks with very weak sparks. This was not sufficient, for a spark from the Leyden phial could be seen in Wallh's experiments, though his torpedo was a very large one. After this, Wallh sent for electrical eels from Surinam; but they all died on the passage, as well as those ordered by Mufchenbroek. In order to procure living ones, Wallh offered a handsome premium; and he soon received in London four electrical eels all alive; and in a letter which he wrote to Mr. Le Roi, (see Roper's Journal de Philique, 1774,) it appears that he succeeded in rendering the sparks visible in the following manner: He placed a leaf of metal on a circular piece of glass; and then cut it in the middle; on taking the fish out of the water and irritating it, he saw the electric sparks pass from one half of the metal to the other. There is no reason to doubt the truth of this experiment; for Sir John Pringle and Mr. Magellan both allured Le Roi that they saw the passage of the sparks, and that the experiment was repeated ten or twelve times with the same result. Mr. Magellan adds, that a company of twenty-four persons held hands and formed a circle; and, when the first touched the eel, that all felt the shock from it to the Leyden phial. The sparks, though more visible in this than in the torpedo, are still so small, that it is necessary to look through a magnifier towards the place where the spark is expected to proceed. See the article Electricity, vol. vi. p. 435.

This fish is caught in nets; the fishermen, when they have got a large one, immediately kill it with a club, to avoid the shocks. At Surinam they preserve young ones in large tubs made on purpose, feeding them with small fish, or, when these are wanting, with earth-worms. Insects they like best, for they swallow them with great avidity the infant they are thrown in. As the skin of this eel secretes a deal of slimy matter, it is necessary to change their water at least every other day; the water is let out by a cock at the bottom of the vessel, and the fish is sometimes left for several hours dry and motionless; but, if touched at that time, the shocks will be given as strong as ever.

Mr. Hunter gave the muscles and nerves of this fish in three plates, (see Phil. Trans. vol. lxi. plate 1, 2, 3.) Fermin found two kinds of muscles; but we cannot conclude that the direction of the muscles in this fish is peculiar to it alone, until more accurate description and comparison shall have been made of other fishes of this genus. Cepede has a long account of the manner in which, as he says, the electric organs act; (see his Hist. des Poissons, ii. 161.) Nothing had been related respecting the intestines and internal conformation, till Bloch described one which was two feet and a half in length; the cavity of the lower belly was four inches long; the skin was thick, and hard like leather; the anus and nostrils were not far from the chin; they were carried along about the skin, and the skin was everted before they entered the abdomen. The gutlet was fleshy, muscular, and plaited or wrinkled. The stomach formed a sac on the right side; it had several large folds, and the cardia and pylorus were clearly distinguishable, but no air-bladder could be discerned. Some have supposed this fish to have lungs, because it comes often to the surface to breathe; but this is not the case. The supposition was for a time countenanced by some observations of Dr. Garden, of South Carolina, who, at the request of Linnaeus, examined the organs of the genus Diodon, and found, as he conceived, both external branchiae or gills, and internal lungs. This idea, however, has been shewn by later physiologists to have been not strictly correct; the supposed lungs being in reality only a peculiar modification of gills.

5. Gymnotus albifrons, the white-fronted gymnotus. Specific character, a fin at the end of the tail, a white band from the tip of the lower jaw to the middle of the back. There is only one ray to the membrane of the lateral fins, 147 to the anal, 40 to the tail. This is made a separate genus by Cepede. The account of its having a tail-fin, which none of the gymnoti have. It gives it a name, apteronotus, which signifies the same as gymnotus; but, as it has no dorsal fin, there is no good reason for separating it. This species has a very blunt snout; the head has no visible scales, and the fish is full of pores which secrete a viscid humour; the aperture of the mouth reaches beyond the eyes, which are covered by a nictating membrane as in the rest of the genus. The nostrils are nearly midway between the eyes and the tip of the muzzle. The lower jaw turns up at the tip, and has two other ridges on each side, which shut into corresponding indentations in the upper. The gill-covers are full of pores which secrete a viscid humour; the aperture is nearly semi-circular. The anus is so near the head as to be placed in the angle which separates the two branchial membranes, near the point where they unite: behind the anus there is another orifice, supposed to give passage to the spawn and milk. The anal fin runs from the throat to the tail-fin, which accounts for the great number of rays in this fish.

What distinguishes this fish from all others, is a long fleshy filament or spar, which arises about the middle of the upper surface of the fish, (the head not included,) and runs looie to the origin of the tail-fin, where it is fastened by its smaller end. As there is underneath it a kind of furrow on the back, Pallas, who first remarked this peculiarity, thought that the specimen he was examining had been cut up the back, so as to leave a portion of the skin fastened at the extremities only; he was however afterwards convinced that it was a natural conformation. Cepede has since described this part more accurately from a specimen in better preservation brought from Holland to Paris. It is convex above, and concave underneath, and fastened by its larger end to the middle of the back; it answers to a furrow, which lefens as the filament becomes thinner, as Pallas observed; but he did not remark that it was again fastened by its smaller end, close to the tail-fin; when raised up, it forms an arch over its extremities. For the end of this fin is the furrow; there are besides a dozen little threads stretching from the furrow to the filament, like the rays of a pin when the membrane is taken away: these threads slope towards the anal fin, and fall underneath when the large filament is let go into the furrow, which fills up entirely. This species is of two colours, black, and the brightest
GYN

6. Gymnotus rostratus, the long-nosed gymnotus. Specific character, a long tubular fin, the anal fin not reaching to the end of the tail. The pectoral fins consist of 19 rays each, the anal of 266 rays. This species is found in South America. The anal fin is much shorter than the tail, which ends in a long slender filament, like the carapo. It is of a white colour, diversified with irregular brown spots.

7. Gymnotus notopterus, the notopterus. Specific character, a small fin on the back. The membrane of the gills has 6 rays, the dorsal fin 7, the pectoral 13, the anal 15; there is no ventral or anal fin. This and the following species are not improperly made a distinct genus by Cepede, under the name of notopterus, which signifies "one dorsal fin," whereas Linneus's generic name gymnotus, means the direct contrary. This species is found in the seas about Amboyna, never exceeding a foot in length. The fin is short and rounded; the eyes are large, and over them is a little hole. The upper jaw is furnished with teeth, even, but not very close together; those of the outer rim of the lower jaw are larger, and still farther aft, but, inside, and on the palate, there is a set of very small teeth. The gall-covering the scales, is divided into seven, with a common circumference. The anus is very near the throat; the tail is so long, that Bontius called this species histrurus, horse-tail. The whole fish is covered with very minute scales, which shine like gold and silver.

8. Gymnotus Athiscus, the scaly notopterus. Specific character, a very long dorsal fin; large round scales over the body; there are five rays in the membrane of the gills. This species, from having an extensive dorsal fin, is still farther removed from the Gymnotus, into which Linneus however has received it, though with a doubt, an hujus generic and Bloch, as well as Cepede, think it should be separated. This dorsal fin reaches from the nape of the neck quite to the tail; and the whole fish, not excepting the head, is covered with pretty large scales, mostly of a round shape. Before each nostril is a truncated barbel; there are several farinoma on the head, and five little dents. The teeth are sharp, and the palate is furnished also with teeth. The lateral line is straight, except a flexure downwards at the anus. It is of a dark brown, transverse bars. It is somewhat larger than the preceding; and, like that, is a native of the seas of Asia.

9. Gymnotus acus, the needle-fish. Specific character, neither dorsal, ventral, nor tail, fin; the anal fin not reaching to the tip of the tail, and containing 60 rays. The membrane of the gills is suffused by 3 rays, the pectorals have 16 each. This species is found in the Mediterranean, near Marseilles. It is white, clouded with red and brown spots; the under part bluish. There is a rising on the back, like the rudiment of a fin, which seems to connect this with the rest of the genera of fishes, almost all of which have a dorsal fin. This is the only species of this genus which is not found in South America, and the only one with this rising on the back, which Cepede has included in the specific character; but this peculiarity is not noticed by Gmelin.

GYNACEUM, [from γυναῖκα, Gr. from γυνή, a woman.] The menstrual discharge, or the lochia.

GYNACOCRATUMENI, an ancient people of Sarma-This fpaces grows to the length of fifteen inches; it is found about Surinam.

GYNACOMANIA, [from γυνή, Gr. a woman, and μανία, madness.] That species of infinity which arises from love.

GYNACOMASTUS, [from γυνή, Gr. a woman, and αμαστος, a breast.] Applied to a man whose breasts are large like a woman's.

GYNÄCOTHENAS, a name of Mars at Tegeda, on account of a sacrifice offered by the women without the affiance of the men, who were not permitted to appear at this religious ceremony. Parvanus.

GYNANDRIA, [Gr. from γυναῖκα, a woman, and andros, a man.] In botany, the name of the twenty-first clas in the Linnean Artificial Sytem, containing all plants with hermaphrodite flowers, which have the flaments growing upon the style; or else having an elongate receptacle bearing both stamens and styles. This clas has been considerably reduced by some modern reformers, who have referred the plants to other classes. This clas is exemplified on the Botany Plate X. fig. 29. vol. iii. p. 256.

GYNANTHROPUS, [from γυνή, Gr. a woman, and ανθρωπος, a man.] That species of hermaphrodite which partakes more of the female than the male.

GYNDES, now ZEINDEH, in ancient geography, a river of Assyria, falling into the Tigris. When Cyrus marched against Babylon, his army was stopped by this river, in which one of his favourite horses was drowned. This so irritated the monarch, that he ordered the river to be conveyed into 360 different channels by his army, so that after this division it hardly reached the knee. Herod. i. c. 189 & 202.

GYNECOCRACY, [γυναικocrατε, Gr. gynecocratic, Fr.] Petticoat government; female power.

GYNEPONON, [Gr. gynos, a woman, and οὖς, a beard; the stigma of the flower being bearded.] In botany, a genus of the clas pentandria, order monogyna, natural order of apocynac, Juff. The generic characters are—Calyx: perianthium one-leaved, very small, half-five-cleft, permanent; segments linear, acute, erect. Corolla: monopetalous, contorted; tube cylindrical, ventricose below the tip, contracted at the throat; border flat, five-parted, segments ovate. Stamina: filaments five, very short, inserted into the tube above the middle; antherae erect, linear, within the tube. Ptilillum: germ ovate; style filiform, shorter than the tube; stigma globular, two-lobed, villose at the tip. Pericarpium: berry pedicelled, subglobular, concave, filled with the seed. Seed: single, carthaginous, sub- The fish is generally abortive, the feed not having kernels; the germs when cut through have two cells, and two feeds in each cell.—Essential Character. Calyx half-five-cleft, inferior, permanent; corolla five-parted, tube ventricose below the tip, throat contracted; stigma globular, two-lobed; berry pedicelled, subglobular; feed carthaginous, fub- bilocular, with one or two kernels. The fruit is generally abortive, the seed not having kernels; the germs when cut through have two cells, and two feeds in each cell.—Essential Character. Calyx half-five-cleft, inferior, permanent; corolla five-parted, tube ventricose below the tip, throat contracted; stigma globular, two-lobed; berry pedicelled, subglobular; seed carthaginous, sub- bilocular.

Species. 1. Gyneponon stellatum, or hairy woman's beard: leaves in whorls, three together, lanceolate. 2. Gyneponon alyxia: leaves in whorls, five together, obo-
3. Gynepogon scandens, or climbing gynopogon: leaves opposite, ovate, ribbed. Natives of the islands of the South Seas. The first of the Society and Friendly islands; the second of Norfolk island; and the third of the Society islands. At Otaheite in May 1774.

GYP, f. GYPSIS. The profession of a gipsy — The companion of his travels is a foulfe, sun-burnt, quene, that since the terrible statute recanted a genus of the class decandria, order digynia, natural being fond of a gypseaous or calcareous soil. In botany, lets ovate, permanent. Corolla: petals five, ovate, obtuse, spreading, subfesile. Stamens: filaments subulate, spreading; antherae roundish. Pistillum: germ almost globular; stigmas filiform, gaping; stigmas simple. Petricarpium: capsule globular, one-celled, five-valved.

GYP SOPHILA, f. [from γυψος, γυπς, Gr, as being fond of a gypseous or calcareous soil.] In botany, petals five, ovate, obtuse, spreading, subfesile. Stamens: filaments subulate, spreading; antherae roundish. Pistillum: germ almost globular; stigmas filiform, gaping; stigmas simple. Petricarpium: capsule globular, one-celled, five-valved. A leaf of this genus is shown in the Botany Plate VI. fig. 2.

Species. 1. Gypsophia repens, or creeping gypsophia: leaves lanceolate, flamer shorter than the emarginate corolla. The whole plant is smooth. Root perennial, very long, as thick as the little finger. Stems many, in a close tuft, spread every way, half a foot in height, perennial; branches herbaceous, erect, from three to six inches high, simple, reddish at the joints, forming an imperfectly trichotomous panicule at the top. Leaves lanceolate-linear, acute, glaucous, thick, fesile, opposite, seldom more than an inch. Flowers red, tubes white, (Miller and Plukenet say purplish;) petals oblong, yellow. Native of Siberia, Swiflerland, and Provence; flowering in September.

2. Gypsophia prostrata, or trailing gypsophia: leaves lanceolate, smooth and even, stalks diffused, pistils longer than the bell-shaped corolla. Root perennial. Stems several, smooth, round, about a foot in length, reddish at the joints. Panicule brachiate, trichotomous, the middle peduncle more simple than the others. Corolla white, (Miller and Plukenet say purplish;) petals obtuse, spreading, channelled at the tip: stigmas only half the length of the corolla; styles a little longer than it. It much resembles the foregoing; but differs in the root hardly creeping; the joints of the stalk being less purple; the leaves of the calyx not keeled; the corolla from one foot to one and a half inches long, as thick as the little finger at the bottom, swelling at the joints, quite entire; the uppermost very small; next the root very many, two inches long, and a line and a half broad; between the peduncles small white stipules. The stalks in this species are procumbent before the flowers expand, which is not the case in G. prostrata; hence the flowers in this are all directed one way. Linnaeus observes, that the flowers in Sweden are always white, and that in its wild state they are suffragiate. The root, as in the foregoing species, has a paponaceous quality, and boiled with linen or woollen may be used instead of soap. Hence the name of sapanaria. It is bitter, and has a solvenl aperient quality. Native of Sweden, Germany, Swiflerland, France, and Siberia. It flowers from June to August. Cultivated in 1759 by Mr. Miller.

3. Gypsophia angustifolia, or triangular-leaved gypsophia: leaves lanceolate-linear, oblique three-cornered, smooth and even, obtuse, directed one way. Root perennial, very long, the thickness of a finger, white, woody. Stalks several, smooth, joined, moore, more than a foot long, branched, ending in a dense suffragiate cyme of flowers. Leaves glaucous-green, opposite, entire, embracing the joints of the stalk with their broad bases, quite entire; the uppermost very small; next the root very many, two inches long, and a line and a half broad; between the peduncles small white stipules. The stalks in this species are procumbent before the flowers expand, which is not the case in G. prostrata; hence the flowers in this are all directed one way. Linnaeus observes, that the flowers in Sweden are always white, and that in its wild state they are suffragiate. The root, as in the foregoing species, has a paponaceous quality, and boiled with linen or woollen may be used instead of soap. Hence the name of sapanaria. It is bitter, and has a solvenl aperient quality. Native of Sweden, Germany, Swiflerland, France, and Siberia. It flowers from June to August. Cultivated in 1759 by Mr. Miller.

4. Gypsophia perfusolata, or perfoliate gypsophia: leaves ovate-lanceolate, half-filimented. Root perennial, strong, fleasy, striking deep into the ground, sending up stalks two and three feet in height, as thick as the little finger at the bottom, swelling at the joints, quite entire; the uppermost very small; next the root very many, two inches long, and a line and a half broad; between the peduncles small white stipules. It is bitter, and has a solvenl aperient quality. Native of Sweden, Germany, Swiflerland, France, and Siberia. It flowers from June to August. Cultivated in 1759 by Mr. Miller.

5. Gypsophia munita, or wall gypsophia: leaves linear, flat, calycis leaflets, stalk dichtomous, petals crenate. Root annual, slender, small. Stalk diffused, a span in length, weak, and therefore seldom upright. Leaves very narrow, an inch and a half long, and one breadth, bright green. Native of Lapland, Sweden, Germany, Swiflerland, France, and Siberia. It flowers with us from June to October.

6. Gypsophia rigidula, or flitt gypsophia: leaves linear, flat, stalk dichtomous, petals two-flowered, petals emarginate. From a very fibrous root spring numerous little stems, not more than a span high, jointed, branched. Flowers pale red. Native of the south of France, and also of Siberia.

7. Gypsophia faxifraga, or small gypsophia: leaves linear, calycis leaflets, stalk dichotomous, petals emarginate. From a very fibrous root spring numerous little stems, not more than a span high, jointed, branched. Flowers pale red. Native of the south of France, and also of Siberia.

8. Gypsophia saxifraga, or small gypsophia: leaves linear, calycis leaflets, stalk dichotomous, petals emarginate. From a very fibrous root spring numerous little stems, not more than a span high, jointed, branched. Flowers pale red. Native of the south of France, and also of Siberia.

9. Gypsophia saxifraga, or small gypsophia: leaves linear, calycis leaflets, stalk dichotomous, petals emarginate. From a very fibrous root spring numerous little stems, not more than a span high, jointed, branched. Flowers pale red. Native of the south of France, and also of Siberia.

10. Gypsophia saxifraga, or small gypsophia: leaves linear, calycis leaflets, stalk dichotomous, petals emarginate. From a very fibrous root spring numerous little stems, not more than a span high, jointed, branched. Flowers pale red. Native of the south of France, and also of Siberia.

11. Gypsophia saxifraga, or small gypsophia: leaves linear, calycis leaflets, stalk dichotomous, petals emarginate. From a very fibrous root spring numerous little stems, not more than a span high, jointed, branched. Flowers pale red. Native of the south of France, and also of Siberia.

12. Gypsophia saxifraga, or small gypsophia: leaves linear, calycis leaflets, stalk dichotomous, petals emarginate. From a very fibrous root spring numerous little stems, not more than a span high, jointed, branched. Flowers pale red. Native of the south of France, and also of Siberia.

13. Gypsophia aggregata. See ARENA TETRAQUETRA.
Propagation and Culture. These plants, having no great beauty, are rarely cultivated in botanic gardens. They are propagated by seeds, sown in a bed of light earth; and, when the plants are fit to remove, they may be transplanted into the places where they are destined to remain, and will require no other culture but to keep them clean from weeds; for the roots of most forts will continue several years, and annually produce flowers and seeds.

GYPSUM, f. [Gypsius, Gr. from γόπες, Arab.] In mineralogy, carbonate of lime, commonly called alabaster, or plaster of Paris. The silver medal of the Society of Arts having been given, in 1805, for extensive and successful experiments of this valuable article, as a new manure, for clover, and all the varieties of grasses on dry lands, we lay before the public, with particular pleasure, an extract of a letter received from a respectable gentleman, high in office in New York, dated the 4th of March 1807, on this interesting subject, which we most earnestly recommend to the immediate notice of the agricultural interests of this nation, as the spring and summeroer seasons are best adapted for the use of this article. It is found to answer best, or cheapest, for plentifully dispersed through some parts of this kingdom, as to ensure an inexhaustible supply. Several of our experimental farmers have assured me, that lands which have been for twenty years manured with gypsum are not impoverished by the use of it. About fifty miles up the Hudson's river from this city, and from thence to the northward, it is in general use, and not less so, as to ensure an inexhaustible supply. Several inftead of liable manure. It is found to answer best on corn have been more than doubled by the use of gypsum in New Jersey and Pennsylvania: its effects are wonderful, particularly on grasses. The crops of corn and Indian beans have been more than doubled by the use of gypsum instead of stable manure. It is found to answer best on dry, gravelly, or sandy, soils. Remote from the sea, it is chiefly in effect, for the other articles. There are probably from 7 to 10,000 tons of Britifh (Nova Scotia and New Brunswick) shiping employed in this trade, who, upon an average, make their registered tonnage, I may safely say more than 40,000 tons are brought here. Of this, however, much has been determined neither by Stephanus, Ferber, nor Gefractioned by any name what we have known this much, that the fragments of the ancient were burnt their gypsum, and that they formed and called images of it. In my opinion, fays professor Beckmann, "wine cannot be poisoned by gypsum; and wine-crafts who employ it and dace devour no ferrer putihniter than brewers, who, in the like manner, render four feet fitter to be drunk and more faleable." GYRALDUS. See GYRALDUS.

GYRA'TION, f. [gyra, Lat.] The act of turning any thing at once.—If a burning coal be nimbly moved round in a circle, with gyrations continually repeated, the whole circle will appear like fire; the reason of which is, that the effection of the coal in the vital places of that circle remains imperceptible on the fenfion; until the coal return to the place from which it first move.—GYRE, f. [gypsius, Lat.] A circle described by any thing moving in an orbit.—The eagle in her gyres the clouds embrace. Sandys.

Quick and more quick he spins in giddy gyres, Then falls, and in much foam his soul expires. Dryden.

He fashioned those harmonious orbs that roll In reliefs gyres about the Arctic pole. Sandys.

GYRED, adj. Falling in rings:—Hamlet, with his doubler all unbrac'd, No hat upon his head, his stockings loofe Ungarter'd, and down gyred to his ankle. Shakespeare.

GYRFALCON. See the article Falco, vol. vii. p. 189.

GYR'INUS, f. [Gypsius, Gr. from γόπες, a round body. The GLIMMER CHAFFER; in entomology, a genus of insects belonging to the order of coleoptera. Generic characters, Antennae clavated, rill, shorter than the head; eyes apparently four, two above and two below the antenne. Linnaeus calls the antennae cylindrical; but Dr. Shaw observes, that, if infected with a magnet, they will be found to consist of very numerous clofe-fet joints. The eyes are so placed as to appear double on each side the head; however they are but two in all. There are eleven species, mostly found on the surface of waters, on which they run and describe circles with great celerity; when attempted to be taken, they plunge to the bottom, drawing after them a bubble reftembling a globule of quickfiver.

1. Gyrinus natator, the water-flea. This insect is about a quarter of an inch in length, of an oval shape, with somewhat sharpened extremities, and of a black or grey-black colour, with fo lucid a surface as to shine like a piece of looking-glass in the sun. It is an inhabitant of the waters, and is thereby found in rivulets, being generally seen in great multitudes, and in brisk motion. It is difficult to catch, diving with astonishing celerity when disturbed; the hinder legs being very broad, finely webbed with minute hairs, and most curiously formed for exercising the office of fins or oars. The larva is of a highly fingular aspect, having a very lengthened body, furnished, exclusive of fix legs on the fore parts, with a great many lateral appendages or processes down the body; those towards the extremity considerably exceeding the rest. In its motions it is extremely agile, swimming in a kind of serpentine manner, and preying on the smaller and weaker water-insects, minute worms, &c. The head is armed with a pair of jaws, pierced on each side the tip with a fmall foramen, through which it fucks the animals on which it preys: the colour of this larva is a very pale or whitish brown.
brown, with a high degree of transparency, which renders it a very curious object for the microscope; its length, when full-grown, is about three quarters of an inch. When the time of its changes arrives, it forms for itself a small oval cell or case on a leaf of fedge or other convenient water-plant, and, after casting its skin, becomes a chrysalis; this change usually takes place in the month of August, and the complete insect emerges in that of September.

When these animals are congregated together in great multitudes on the surface of the water, which frequently happens in hot weather, they have been observed to dilute a strong or disagreeable scum to a considerable degree of its strength, and other water-beetles, they fly only by night. They deposit their eggs, which are very small, white, and of a somewhat cylindrical form, on the stems of water-plants: they hatch in the space of about eight days, and immediately begin to swim about with much briskness in search of prey. The Gyrinus matator is shown on the annexed Plate, fig. 1.

1. Gyrinus bicolor: black, beneath ferrugineous; hind legs compressed. Inhabits Sweden: larger than the lad.
3. Gyrinus Americanus: smooth, black, opaque; four hind legs short, tessaceous. Inhabits America; larger than the lad.
4. Gyrinus micans: smooth, olive, polished; shells with a glossy band behind. Body olive, with a coppery and silvery gloss, beneath black; hind legs tessaceous. Inhabits Guiana; the largest of its tribe.
5. Gyrinus spinosus: black, polished; thorax and shells edged with yellow; shells spinous. Shells with two long sharp spines; body beneath ferrugineous; tail black. Inhabits Coromandel.
6. Gyrinus fraterius: green, polished; edges of the thorax and shells pale; shells fricate. Antennae green; head brassy green; front sometimes violet; shells fricate with green and violet, rounded at the tip; legs pale. Inhabitats Barbary.
7. Gyrinus grofissus: beneath black; above paler, very smooth; shells rounded at the tip. Inhabits clear waters at the Cape of Good Hope.
8. Gyrinus formosus: beneath black; breast, sternum, and legs, ferrugineous; above brassy green; transverse line on the lip, two spots on the front, transverse interrupted line on the thorax, and stripes on the shells; gold roofed. Inhabits clear water at the Cape of Good Hope.
9. Gyrinus orientalis: beneath pale ferrugineous, above brassy black; shells each side compressed, slightly fricate, bronzed, four-toothed behind. Body roundish; shells as long as the body.

GYROCAR'PUS, in botany, the CATAMARAN-Tree, described by Dr. Ruffell. The generic characters are—Hermaphrodite: Calyx above, four-leaved; leaflets unequal; exterior pair small, oval, falling; interior pair large, wedge-shaped, three-toothed, permanent, and increasing in size with the pericarp into long membranaceous wings. Nectary, four, four-celled, yellow, glandular. Filaments four, longer than the calyx, inserted alternately with the nectarial glands into a perforated receptacle. Anthers quadrangular, opening on each side with an oval lid. Germ below. Stigma small, imbered in the perforation of the receptacle of the filaments and nectarial glands. Cupule globular, wrinkled, one-celled, one-valved, does not open, filled with a cherry, rains in two long, obtuse, lanced, membranaceous wings. See the Plate, fig. 4.

It grows to be a very large tree, is chiefly a native of the mountainous parts of the coast of Coromandel; casts its leaves about the end of the wet season; flowers during the cold season, when the tree is naked; the leaves come out soon after. The wood of this tree is white, and very light; it is employed to make catamarans (rafts) when to be had, in preference to any other.

GYROMANCY, f. [from gyro, Lat. to round, and mane, Gr. magic.] A kind of divination performed by walking round in a circle.

GYRON, GYRONE, GYRONEE, f. in heraldry, an ordinary confuting of two lines drawn from several points of the escutcheon, and meeting in an acute angle in the fpee point.

GYROVA'GI, a sect of wandering monks, who pretending great piety left their own cloisters, and visited others. Matt. Paris, 490.

GYROW', a river of Wales, which runs into the Dee five miles below Bala in Merionethshire.

GYV'HORN, a river of Sweden, in Arnumburgh, situated on the river Aller, in lat. 52° 30'.

GYRT, a sea-port town of Sweden, in the province of East Gothland; thirty miles south-east of Nordkoping.

GY'SSENS, a town of the island of Borneo, on the GYTHE'UM, in ancient geography, a sea-port town of the island of Cerago, the ancient Cytheus. It was visited by D. and N. Stephanopoli in the year 1798. One half of it is covered by the sea, but visible under its waves, and the other is on dry land. They state its circumference to be about twelve miles. Its harbour must have been completely sheltered, and impregnable both by sea and land. Among the curiosities, is a fort of amphitheatre cut out of a rock; a very remarkable defile, which could not have been formed without incredible labour. Several inscriptions and other curiosities are also mentioned as having been discovered by these visitors. A statue of Liberty, taken out of the ruins of the temple of Victory, in the possession of the ex-bey of Malta, they begged as a present for Bonaparte; it was given to them, and is now in his cabinet. The goddess holds a long pike in her right hand, and in her left a code mounted with a laurel crown. The device is, 

GYTH'HUM, the name of the famed Spartan sea-port of the island of Ceraiga, the ancient Cytheus. It was visited by D. and N. Stephanopoli in the year 1798. One half of it is covered by the sea, but visible under its waves, and the other is on dry land. They state its circumference to be about twelve miles. Its harbour must have been completely sheltered, and impregnable both by sea and land. Among the curiosities, is a fort of amphitheatre cut out of a rock; a very remarkable defile, which could not have been formed without incredible labour. Several inscriptions and other curiosities are also mentioned as having been discovered by these visitors. A statue of Liberty, taken out of the ruins of the temple of Victory, in the possession of the ex-bey of Malta, they begged as a present for Bonaparte; it was given to them, and is now in his cabinet. The goddess holds a long pike in her right hand, and in her left a code mounted with a laurel crown.

The device is, 

GYV, am. To setet; to shacktle; enchain; to enframe.—With as little a web as this, will I enframe as great a fly as Caelio. Ay, smile upon her, do. I will gyve thee in thine own courtship. Shakespeare.
GYRINUS AND GYROCARPUS.

the H, in English, as in other languages, has the effect of a note of aspiration, being founded by a strong emission of the breath, without any confinement of the organs of speech; and hence, by many grammarians, it is said to be no letter. The h in English is scarcely ever mute at the beginning of a word, or where it immediately precedes a vowel; as house, behaviour: it is laid to be no letter. The thse of England, it made the fullable guttural; as broth, ribbons, hats, and stockings. They send word for building to Holland, masts, &c. which they send by means of a canal to the Elbe; seventeen barges are appropriated for this purpose, and two sail every day: pailage boats sail from Hamburg every day, with a fixed price for passengers and goods. It is defended by a fort between the town and the Elbe. In 1757, it was taken by the French, but retaken by the Hanoverians the same year; seven miles south of Hamburg, and thirty-two miles north-west of Luneburg.

HAremen, a town of Germany, in the circle of Oettingen-Wallerstein, on the Wernitz; nine miles south of Oettingen, and thirty-four miles north-east of Lubeck. Lat. 53° 33' N. Lon. 12° 21' E. Ferro.

HA'ARKIR'CHEM, a town of Germany, in the arch-duchy of Austria; three miles north of Eferding.

HA'AREM, a town of Germany, in the circle of Westphalia, and county of Mark; two miles east of Helmstadt.

HA'AS (John Matthew), a German geographer and mathematician, born at Augsburg in 1684. Having completed the first part of his education, he was sent to Helmstadt to study theology; but the mathematicics being his favourite pursuit, after defending in a public thes a treatise which he wrote on the geometry of the Chinese, he removed to Leipzig, where in 1716 he had the honour of being admitted a member of the faculty of philosophy and mathematics. In 1720, he obtained an appointment at Wittenberg, where he distinguished himself by an ingenious and well-written treatise on guaging, which was published in 1728, under the title of Deplanuris Dimesiones, sive Pliometria. He now embraced the study of geography, and acquired the greatest celebrity by his maps; the principal object of which was to exhibit with more accuracy the situation of countries at that time little known. On this account his maps of Hungary, Russia, China, and Africa, were much-esteemed. Butsching gives them the character of being constructed with uncommon care and accuracy. That of Russia, entitled Tabula Imperii Russici et Tartarii Universae, excited the astonishment of the Russians themselves; and Buschenhays, that, in regard to the projection, it may be considered as a model. It was received with great approbation by the Imperial Academy of Sciences at Peterburgh. Another work, which gained him considerable credit, was his Descriptio Geographicæ et Historica

Pp

Regi
three north-west of Orthez. 

The law of the land. 'if Mag. C. jeft's writ of right, whenever oppofed by illegal im-
pact, which is, "that n

prifonment; founded on, and fecured -by, various,,da-
tutes ; of which the lad and mod powerful, the dat.

Landes : three leagues and a half fouth of Dax, and

prophesy, its diCtion, imagery, Ipirit, and fublimity, can

their emancipation from Egyptian flavery. From Lome

hovah's faithful word, and in conformity with the plan

for their heinous crimes; the fubfequent ruin of the

probable, however, that he fl.ourifhed after the taking

Babylonidi empire ; and the deliverance from captivity

were publifhed after the author's death,
in 1739, under the general title of, An Hidorical Atlas,
containing the great Kingdoms and Monarchies, accord-
ing to the Syftem of ancient Geography. This was the
last production of the learned and indudrious author,
who died in the fifty-eighth year of his age, in Septem-
ber, 1742.

HAB'ZENA, [a bridge.] In surgery, a bandage for
keeping the lips of wounds together, usually made in
the form of a bridge.

HAB'AKKUK, the eighth of the minor Hebrew pro-
phets, according to the order in which they are placed
in the Hebrew and Greek Bibles. We have no infor-
mation respecting either the parents from whom he
was defcended, or the time in which he lived. It feems
probable, however, that he flourifhed after the taking
of Nineveh; as he prophesies of the Chaldeans, and is
fient on the subject of the Assyrians. The fubjects of
his predictions are: the defolation and deftruction of
Judah and Jerusalem by the Chaldeans, as a punishment
for their heinous crimes; the fubfquent ruin of the
Babylonifh empire; and the deliverance from captivity
which the Jews would experience, according to Je-
hovah's faithful word, and in conformity with the plan
of the divine proceedings relating to them ever since
their emancipation from Egyptian flavery. From some
expressions which occur in them, we may conclude,
that he prophesied not long before the Jewish capti-
vity. He may, therefore, be placed in the reign of
Jehoiakim, between the years 606 and 598 before Chrift.
The style of the book of Habakkuk is poetical, and,
according to the judgment of bishops Lowth and New-
comb, belongs high in the class of Hebrew poems.
The beautiful connection between the parts of this pro-
phesy, its diCtion, imagery, spirit, and fublimity, can-
not be too much admired. The bef English version
this prophet is that of Dr. Newcombe, bishop of Water-
ford, and afterwards primate of Ireland, in his Attempt
wards towards an improved Version of the twelve minor Pro-
phets.

H A B, a town of Perfa, in the province of Irak.

H A B, a town of France, in the department of the
Landes: three leagues and a half south of Dax, and
three north-west of Orthez.

H A B, or B A T, a province of the empire
of the conf of the Atlantic Ocean,
about forty miles square. The principal town is Sallée.

H A D A L A, f. [from the Heb. signifying a separa-
tion.] That part of the service or ceremony with
which the Jews conclude the fabbath.

H A B E A S C O R P U S, f. [Latin.] In law, the sub-
ject's writ of right, whenever oppofed by illegal in-
prifonment; founded on, and focused by, various,fit-
tutes ; of which the lat and most powerful, the flat.
31 Car. II. c. 2, is emphatically filled the Habeas
Corpus Act; and is the next in importance, and be-
neficial effeCt, to Magna Charta; the language of
which is, "that no freeman fhall be taken or imprif-
oned, but by the lawful judgment of his equals, or by
the law of the land."

Of the writ of habeas corpus there are various kinds,
and often used for removing prisoners from one court
into another for the more eafy administration of jufliice.
Such is the habeas corpus ad refpondendum, when a man
has a caufe of action againd one who is confined by
the proceeds of some inferior court; in order to remove
the prifoner, and charge him with this new action in
the court above.

Habeas corpus ad satisfac
tionem, when a prifoner has judgment againd him in an
action, and the plaintiff is defirous to bring him up to
some superior court, to charge him with proceeds of execu-
tion. Similar alfo are the writs habeas corpus ad pro-
fequendum, et satisfac
tionem, &c. which iflue when
it is neceffary to remove a prifoner, in order to proce-
dute any other caufe in some other court, and it in-
cludes the praebenda, or other benefactions, which
the proper jurifdiction wherein the fact was committed,
Sufh is likewise the writ of habeas corpus ad facientium
et recipiendum, which iflues out of any of the courts of
Wefminster-hall, when a perfon is figned in fome infe-
rior jurifdiction, and is defirous to remove the action
by the inferior court; commanding the inferior judges
to produce the body of the defendant, together with
the day and caufe of his caption and detainer; whence
the writ is often denominated an habeas corpus cum
causa; to do and receive whatever the king's court fhall
confider in that behalf. This is a writ grantable of
common right, without any motion in court; and it in-
cludes the praebenda, or other benefactions, which
the court of record is a barrider of three years dand-
and often ufed for removing prifoners from one court
out of any gaol, unlefs figned by fome judge of the
court out of which it is awarded. And, to avoid vexa-
tious delays by removal of frivolous caufes, it is enaCted
by flat. 1 Jac. I. c. 23, that, where the judge of an in-
ferior court of record is a barrider of three years stand-
ning, no caufe fhall be removed from thence by habeas
corpus or other writ, after id'ue or demurrer deliberately
joined; no caufe, if once remanded to the inferior
court by writ of procedendo or otherwise, fhall ever after-
wards be again removed; and that no caufe fhall be re-
moved at all, if the debt or damages laid in the decla-
ration do not amount to the sum of five pounds.

But an expedient having been found out to elude the latter
branch of the flattine, by procuring a nominal plaintiff
to bring another action for five pounds or upwards (and
then by the coufe of the court the habeas corpus re-
covers the defendant again for the court out of which the
action was given), it is provided by flat. 12 Geo. I. c. 29,
that the inferior court may pro-
ceed in fuch actions as are under the value of five
pounds, notwithfanding other actions may be brought
against the fame defendant to a greater amount. But
the grand palladium of the liberty of the subject, Judge
Blackstone very judely observes, is the writ of habeas
corpus ad satisfac
tionem, directed to the perfon retaining
another, and commanding him to produce the body of
the prifoner, with the day and caufe of his caption and
detention, ad facientium, nationem, et recipiendum, to do,
submit to, and receive, whatever the judge or court
awarding fuch writ fhall direct in that behalf.

The high court of king's-bench, to which the court
of king's-bench, not only in term-time, but also during the
vacation, by a fuit from the chief juftice, or any other of
the judges, and extends into all parts of the king's domi-
nions: for the king is at all times entitled to have an
account why the liberty of any of his subjets is re-
trained, wherever that retrainment may be infiidled. If it
iflues in vacation, it is usually returnable before the
judge himfelf who awarded it, and he proceeds by him-
sel thereon; unlefs the term fhould intervene, and,
account why the liberty of any of his fubjects is re-

but, if he were committed for any criminal matter, they could only have remanded him, or taken bail for appearance in the court of King's-bench; which occasioned the common-pleas to discountenance such applications. It hath also been argued by very respectable authorities, that the writ of habeas corpus ought to be confined to the court of chancery in vacation; but upon the famous application to lord Nottingham by Jenks, notwithstanding the most diligent enquiry, no precedent could be found where the chancellor had issued such a writ in vacation; and therefore his lordship refused it.

To obtain a writ of habeas corpus in the case of a king's subject, it is necessary to apply to the court, as in the case of all other prerogative writs which do not issue as of mere course, without shewing some probable cause why the extraordinary power of the crown is called in to the party's affiance. For, as was argued by lord chief-justice Vaughan, it is granted on motion, because it cannot be had of course; and there is therefore no necessity to grant it: for the court ought to be satisfied that the party hath a probable cause to be delivered. And this seems the more reasonable, because, when once granted, the person to whom it is directed can return no satisfactory excuse for not bringing up the body of the prisoner: as a proof whereof, without shewing any reasonable ground for awarding it, a traitor forfeited unless by the commission of some great and mortal offence, the writ of habeas corpus is then a writ of right, handed down to us from the Anglo-Saxons, not brought or instituted from foreign usages, but originating in the necessity of securing the crown against the king's service, a wife, a child, a relation, or a dependent of the king; and which was the necessity of being on the principle of the act of parliament, that the writ should be immediate before him, or any other of the judges; and upon the return made shall discharge the party, if bailable, upon giving security to appear and answer to the accusation in the proper court of judicature. 4. That officers and keepers neglecting to make due returns, or not delivering to the prisoner or his agent, within fix hours after demand, a copy of the warrant, or for failing to bring up the body of the prisoner, without shewing that it was done by some compulsion or necessity of expediting the prisoner, or that the act of parliament has neglected for two terms to apply to any court for his enlargement, award a habeas corpus for such prisoner, returnable immediately before himself or any other of the judges; and upon the return made shall discharge the party, if bailable, upon giving security to appear and answer to the accusation in the proper court of judicature. 5. That no person, once delivered by habeas corpus, shall be recommitted for the same offence, on penalty of $500. 6. That every person committed for treason or felony shall, if he requires it, the first week of the next term, or the first day of the next assizes of oyer and terminer, be indicted in that term or session, or else admitted to bail; unless the king's witnesses cannot be produced at that time: and if acquitted, or not indicted and tried in the second term or session, he shall be discharged from his imprisonment for such indicted offence: but that no person, after the assizes shall be opened for the county in which he is detained, shall be remanded by habeas corpus, till after the assizes are ended; but shall be left to the justice of the judges of assize. 7. That any such prisoner may move for and obtain his habeas corpus, as well out of the chancery or exchequer as out of the King's-bench or common-pleas; and the lord chancellor or judges denying the same, on sight of the warrant, shall be incapable of the king's pardon. 8. That the writs of habeas corpus shall run into the counties-palatine, cinque ports, and other privileged places, and the islands of Jersey and Guernsey. 9. That no inhabitant of England (except persons contracting, or convicts praying to be transported, or having committed some capital offence in the place to which they are sent) shall be sent prisoner to Scotland, Ireland, Jersey, Guernsey, or any places beyond the seas, within or without the king's dominions: on pain that the party committing, his advisers, aiders, and affiliates, shall forfeit to the party charged a sum not less than $500, to be recovered with treble costs; shall be liable to bear any office of trust or profit; shall incur the penalties of perjury, and shall be incapable of the king's pardon.

Such is the sufficiency of this great and important statute, as it extends to the case of commitments for such criminal charges as can produce no inconvenience to public justice by a temporary enlargement of the prisoner; all other cases of unjust imprisonment being left to the habeas corpus at common law. But even upon writs at the common law it is now expected by the court, agreeable to ancient precedents and the spirit of the act of parliament, that the writ should be immediately granted, and that the prisoner, without shewing any cause for delay, except otherwise an attachment will subsist. By these admirable regulations, judicial as well parliamentary, the remedy is complete for removing the injury of unjust and illegal confinement.
HABEEBA, a small island in the Mediterranean, near the coast of Algiers, with a harbour and fresh water: sixteen miles south-west of Cape Falcon.

HABELSCHERDT, a town of Silesia, in the province of Gießen; and, when the university was established in 1624. His works are held in much esteem; particularly his Haabilitationes, written in reply to the learned and laborious defences of the catholic faith by the two brothers, Adrian and Peter Wallenburg. He died at Gießen in 1676. He was the author of, 1. Vindicatio Fidei contra Helvicum Ulricum. 3. Syntagma Dissertationale Theologicarum. 4. Anti-Faldonianus. 5. Relatio Adsum Colloqui Rheinsteina, &c.

HABERSDORF, See Finkenstein.

HABERT (Isaac), a learned French prelate in the seventeenth century, but the place and time of whose birth are unknown. In 1626 he was admitted to the degree of doctor by the faculty of the Sorbonne at Paris, and afterwards promoted to a canonry and prebend of the cathedral church in that city. He was at this time selected for the approbation to father Gibeut's treatise On the Liberty of God and the Creature, he became involved in a controversy with the Jesuits, concerning the doctrine of efficacious grace, which he held in a sense different from that of Janinienus, to whose system he was hostile, as well as to that of his opponents. Cardinal Richelieu employed him to combat in the pulpit the Auguinfmus of Ypres. This task he undertook in three sermons, which he preached and published at Paris in 1642 and 1643. The appearance of these sermons gave rise to a controversy between the author and the celebrated M. Arnauld, the titles of whose reply, and of M. Habert's rejoinder, &c., the curious reader may find in Moreri. As a proof of the minister's approbation of his opinions, he was nominated to the bishopric of Vabres, where he died in 1668, equally respected for his virtues and for his erudition. He published, 1. Liber Pontificum Graecorum, Graec. & Lat. 1645, folio, of which he furnished the Latin version, and numerous learned illustrative notes. 2. De Confessibus Hierarchiae Et Monarchiae, 1640, 4to, in reply to the Quaestiones of Charles Herbert. 3. De Cathedra, seu Privatus S. Petri, 1645. 4. A Defence of the Doctrine of the Greek Fathers concerning Grace, 1646. 5. An Exposition of the Epistles of St. Paul to Timothy, Titus, and Philemon, 1656. He was also not an unsuccessful cultivator of Latin poetry; as may be seen from a collection of his principal pieces, published in 1623, 4to, and his Hymns for the Festival of St. Louis, inserted in the Paris Breviary.

HABIL'IMIENT,
HABILIMENT, f. [French.] Drefs; clothes; garment.
He the faireft Una found,
Strange lady, in so strange habiliments,
Teaching the fayries.

Spenfer.

To HABILITATE, v. n. [habiliter, Fr.] To QUALIFY; to endue. Not in v. c.—Divers persons in the house of commons were attainted, and thereby not legal nor habituate to serve in parliament, being disabled in the highest degree. Bacon.

HABILITATION, f. Qualification.—The things are but habituations towards arms; and what is habitation, without intention and act? Bacon.

HABITUZ. f. [habitaul, Fr.] Faculty; power; now ability. Possessions.

But low'd this fresh young knight, that dwelt her ny,
The lustif Aladine, though meaner boro,
And of leffe livelihood and ability. Spenfer.

HABINGTON (William), an English poet and historian, born in 1605, at Headlip in Worceftershire, and educated at St. Omer, and at Paris. He died in 1655, and left several manuscripts in the hands of his son. His printed works are, 1. Poems under the title of Cofumi. 2. The Queen of Arragon, a tragic-comedy. 3. Observations upon History. 4. The History of Edward IV. king of England, said to be written at the desire of Charles I.

HABRHAOUTCHIN', a town of Chinefe Tartary, in the country of the Monguls. Lat. 44. 10. N. Ion. 132.

HABIS, a king of Spain, celebrated as being the first prince who taught his Subjects agriculture. Jofins.

HABIT, f. [habitua, Lat.] State of any thing; as, habit of body. Drefs; accoutrement; garment.—Changes there are in veins of wit, like those of habits, or other modes. Temple.

I shifted
Into a madman's rags, 'tis assume a resemblance
The very dogs disdain'd; and in this habit
Met I my father. Shakespeare.

Habit is a power or ability in man of doing any thing, when it has been acquired by frequent doing the same thing. Locke.—He hath a better bad habit of knowing than the count Palatine. Shakespeare.—Custom; inveterate use.—The force of education is fo great, that we are as (hall ever afterwards remain. Atterbury.

No civil broils have since his death arofe.
But faction now by habit does obey;
And wars have that respect for his repose,
As winds for halcyons when they breed at sea. Dryden.

To HABIT, v. a. To dress; to accoutre; to array.—They habited themselves like those rural deities, and imitated them in their rustic dances. Dryden.

HABITABLE, adj. [Fr. habitable, Lat.] Capable of being dwelt in; capable of fulfilling human creatures. The torrid zone is now found habitable. Cowley.

Look round the habitable world, how few
Know their own good, or knowing it purse. Dryden.

Habitatenz, f. [habitatenz, Lat.] Dwelling; abode;
What art thou, man, if man at all thou art,
That here in dart haft thine habitation?
And thes rich heaps of wealth doth hide apart
From the world's eye, and from her right usance. Spenfer.

Vol. IX. No. 573.
HA'BLE, adj. [from habita, Lat.] Proper: As hagard hauke, presuming to contend With hardy fowle above his habble might. Spenfer.

HA'BLE, f. A sea-port; a haven. An old word. HABNAB's, adj. [hap no hop, or nap; as would would, or wé would, will nil, or wé will; that is, let it happen or not.] At random; at the mercy of chance; without any rule or certainty of effect:

fic circles draws, and squares, With eyphers, altrid characters, Then looks'em o'er to understand 'em, Although set down hhabnab; to which part of the ten tribes of Israel were led Kings, Houseking of Israel. 2 xvi. 8, xviii. 8.

HAB'ST, a town of Persia, in the province of Segeltan: sixty-seven leagues south-east of Zareng.

HABS'BURG, or HAPS'BURG, a castle of Swifferland, in the canton of Berne, advantageously situated on the right bank of the Aar, about a league above the land, in the canton of Berne, advantageously fituated, and by him given to his town of Bruck, built by count Vernor, bishop of Stras¬burg, in the eleventh century, and by him given to his
title of the count of Habfburg, which his descen-
dants always bore till the elevation of Rudolph I. to the empire of Germany, and archduchy of Austria. It was
then given as a fee to the lords of Wileck, and after them to the lords of Wholen. When the Bermois con-
tered the Argau, in 1415, this castle came under their
dominion. An officer is stationed here to give the alarm, in case a fire should break out in the neighbourhood. It is five miles north of Leuzburg.

HAB'SIEIM, a town of France, in the department of the Upper Rhine, burnt by the Swifs in 1468; eleven miles north-north-west of Huningue, and nine north-north-east of Aitkirch.

HA'BUR, a small island in the Red Sea, two leagues from the coast of Arabia. Lat. 16. 45. N. lon. 41. 45. E. Ferro.

HA'BUR, a town of Arabia, in the province of e-
...twenty-three miles south-west of Chamir.

HACH'A, or LA HACHA, a province, and a river, with a town of the same name, in Terra Firma, or Caffile del Oro, in South America. The province is surrounded on two sides by the ocean, viz. on the north and north-west, and on the third eastward by the gulf of Vene-
zeula. The town is situated at the mouth of the river, on its west side, on a little hill, about a mile from the sea. The soil about it is very rich, and abounds with productions common to the climate, also European plants and fruits; well supplied with salt-springs, veins of gold, and fome gems of great value. The harbour is none of the leaft, being exposed to the north winds. It is about
...eight leagues from New Salamanca, and eighteen from Cape Veho, north-by-east, and 246 miles east of Cartha-
gena. Here the Spanish galleries touch on their arrival in South America, from whence express are sent to all the settlements to give them notice of it. In 1595 it was surprized and sacked by Sir Francis Drake. Lat. 12. 29. N. lon. 25. 50. E. Ferro.

HACH'ENBURG, a town of Germany, in the circle of Wisphalin, and county of Seyn, which gives title to a branch of that house called Seyn Hackenburg: twenty
...years north-east of Coblentz. Lat. 50. 33. N. lon. 23. 24. E. Ferro.

HACH'OW'KA, a town of Poland, in the province of Volhynia: thirty-four miles north of Zytomiers.

HACH'UT, or HACH'OW'KA, a town of Hungary: eight
...nine leagues south-east of Zareng.

HAC'KEMBERG, a mountain of Swifferland, in the circle of Glaruzen, and canton of Schwitz.

HACK'ET (John), a learned English prelate, born at London in 1592. He received his grammar learning at Weintinig-school, whence he was elected to Trinity-college, Cambridge, in 1628. In 1612 he was admitted to the degree of bachelor of arts, and as soon as the li-
tutes permitted was chosen fellow of his college. He retired into Nottinghamshire with lord Byron; and while there composed a Latin comedy, entitled Lycopol; which was twice acted before James I. and printed in 1628, 8vo.

Upon his return to college, he applied himself wholly to the study of divinity, and in 1628 was admitted into holy orders. His merits recommended him, in 1623, to the degree of bachelor in divinity; and in the same year he was nominated chaplain in ordinary to James I. and collated to a prebend in the cathedral church of Lincoln. During the following year, upon the lord-keeper's re-
...made archdeacon of Bedford. He now diligently applied himself to the dis-
...in the parish of St. Andrew's, Holborn, in London; and in the fame
...and, to maintain in his fock a ready attachment to the doctrine and discipline of the church as established by law. In 1642, Dr. Hacket was presented to a prebend and residuaryhip in the cathedral church of St. Paul's. He enjoyed little benefit, however, from these prefer-
...bezelement of much of the materials as could be con-
...while the episcopal palaces were either entirely demolifhied, or in a wretched state from dilapi-
dations. In the course of eight years he entirely reflored his cathedral, in a more complete and beautiful form
...twenty thousand pounds, a considerable part of which was de-
...hauke, presuming to contend With hardy fowle above his habble might. Spenfer.
buildings which he added to Trinity-college; and afterwards, by legacies to other colleges, and the bequest of all his books to the university library. He died at Lichfield in 1670, in the seventy-eighth year of his age. The only pieces of his published during his life were the comedy and漫anment, and a single sermon preached before the king. But after his death Dr. Plume published A Century of his Sermons, upon several remarkable Subjects, 1675, folio; and in 1693 appeared his learned and valuable Life of Archbishop Williams, in folio, of which an abridgment was published in 1700, 8vo. by Alexander Philips.

HACK'ETSTOWN, a post-town of the American States, in Sussex county, New Jersey, on the north-west side of Muckconcum river. It is about three miles above the mineral spring near Roxbury, on the opposite side of the river, twenty-two miles west-north-west of Morristown, sixteen south-west-by-west of Sussex court-house, and two north-north-east of Philadelphia.

HACKING, f. The act of cutting with repeated blows; the act of speaking unreadily.

HACK'INSACK, a river of the American States, in New Jersey, which rises in New York, and runs a four-mile course four or five miles west of Hudson's river. It unites with Passaic river at the head of Newark bay, and is navigable about fifteen miles.

HACK'INSACK, a town of the American States, in Bergen county, New Jersey, situated near the west bank of the above river, twenty miles north-west of New York city. The inhabitants are mostly Dutch. The houses are chiefly built of stone, in the Dutch taste. Here are a Dutch and episcopal church, a court-house, and a flourishing academy. The people, who are mostly farmers, carry their produce to New York.

HACKLE, f. An instrument for dressing flax; raw silk; any firmly substance unfpun.—Take the hackle of a cock or capon's neck, or a plow's top; take off one feather, and then take the hackle out of it, and make them fast at the bent of the hook. Wattson.

To HACKLE, v. a. To dress flax, hemp, etc. with a hackle.

HACKNEY, f. [hacknai, Welsh; hackney, Teut. haquet, Fr.] A pacing horse. A hired horse; hired horses being usually taught to pace, or recommended as good pacers.—Light and well born were as easily furnished to make an affidavit for money, as post-horses and hackneys are taken to hire, Bacon.—An hireling; a prostitute.

HAD, the preterite and part. p. of have. One piece of armour.—You may see the very fastidious of the Irith horsemans in his long hose, riding shoes of costly cordwain, his haqueton, and his habergeon. Spenser.

HAC'ZEG, a town of Transilvania: thirty miles north-west of Sepsis, &c. 

HACQ'UEVILLE, a town of France, in the departement of Aisne. 

HAD, the preterite and part. p. of have. I had better, you had better, it would be better for me or you; or it would be more eligible: it is always used potentially; not indicatively: nor is it always ufed potentially; not indicatively: nor is it always used potentially; not indicatively; nor is it always used potentially; not indicatively.

HADZEC, f. in botany. See Gundelia.

HAC'ZEG, a town of Transylvania; thirty miles north of Hunyad.

HAD, the preterite and part. p. of have. I had better, you had better, it would be better for me or you; or it would be more eligible: it is always used potentially; not indicatively: nor is it always used potentially; not indicatively. We say likewise, it had been better or worse.

I had rather be a country servant maid, Than a queen with this condition. Shakespeare.
HAD-Y-WIST, a compound of words meaning, had I known. Vain pursuits; vain afterthought: the number of persons employed in this branch is great-
mus was subcribed; but the trade proving unsuccessful, the company was dissolved, and a new one formed, which also in its turn was dissolved a few years ago.

The abbey of Haddington was situated two miles to the eastward of the burgh, where there is still a little village called The Abbey, but the monastery itself is almost entirely demolished. It was founded in 1178, by Ada, mother of Malcolm IV. and William the Lion, kings of Scotland, and dedicated to the Virgin Mary. It was at this abbey that the parliament was summoned July 7, 1548, during the siege of Haddington, which gave content to queen Mary's marriage with the dauphin, and her education at the court of France. Haddington has suffered frequently from fire, and from the inundations of the Tyne, which, October 4, 1775, rose seventeen feet perpendicular, continued in this state several hours, and then gradually subsided. The number of inhabitants is estimated at more than two thousand. John Knox, the famous reformer, was a native of this town. It is twenty-eight miles north-west of Berwick, and fourteen miles of Edinburgh.

HADDINGTONSHIRE, or EAST LOTHIAN, a county of Scotland, bounded on the north-west by the Frith of Forth, on the north-east by the German Ocean, on the south and south-east by Berwickshire, and on the west by Edinburghshire. The form is an irregular square, and measures about fifteen miles each way. It is in general a rich tract of corn-land, with some considerable woods; and plenty of small villages and market-towns. The coast is a good one, with convenient harbours and fishing-towns; great numbers of sheep are fed in the hilly parts, and abundance of rabbits are tound along the coasts. Salt is made in several places, and the country may in general be accounted fertile, rich, and pleasant. The chief towns are Dunbar, Haddington, and North Berwick; the principal river is the Tyne. It returns one member to the British parliament.

HADDO, a town of Scotland, in the county of Aberdeen; nine miles north-north-east of Inverary.

HADDON (Walter), an elegant English scholar, born of a good family in Buckinghamshire, in 1516. He was educated at Eton school under Dr. Cox, afterwards bishop of Ely; and in 1533 was elected to King's college, Cambridge, of which he afterwards became a fellow. He was connected with the principal ornaments of that society, having, by an assiduous study of the best writers, acquired a very elegant Latin style, and made himself a proficient in oratory and poetry. His particular pursuit was the civil law, in which he took a doctor's degree, and read public lectures; and was for some time professer of rhetoric, and orator of the university. His zeal in the cause of reformation, together with his literary reputation, caused him in the reign of Edward VI. to be made master of Trinity-hall in the room of bishop Gardiner. In 1539 he served the office of vice-chancellor; and two years afterwards was chosen president of Magdalen-college, Oxford. He was afterwards made archbishop of Canterbury, made him judge of his prerogative court. He was one of the queen's commissi-
HAD

HADENSBEREN, a town of Germany, in Lower Saxony, and principality of Magdeburg; twenty miles south-west of Magdeburg.

HADJRAMAUT, a province of Arabia Felix, bounded on the north by a defert, on the north-east by the province of Oman on the south-east by the sea, and on the west by Yemen. Some parts are dry and desert; others, particularly the hills, are extremely fertile, with well-watered valleys between. The principal articles of production are frankincense, gum-arabic, dragons-blood, myrrh, and aloes; the latter chiefly produced in the island of Socatra, which belongs to the princes of Hadramaut. This province contains several large towns and fortresses.

HADJRAMAUT, a town of Arabia Felix, capital of the above-mentioned province, to which it gives name; 360 miles east-north-east of Mocha.

HADONFIELD, a town of the American States, in Hampshire county, New Jersey, nine miles south-east of Philadelphia, and seventeen from Burlington. Several of his original letters are preserved among the Harleian manuscripts.

HADONFIELD, a town of the American States, in Gloucester county, New Jersey, nine miles south-east of Philadelphia, and seventeen from Burlington.

HADFIELDS, a small country of Germany, situated near the Elbe, bordering on the duchy of Bremen, about eight miles in length, and nearly as much in breadth, secured from inundations by a large dyke. The land is fertile, and abounds in grain, fruit, and cattle, with plenty of fish. It forms a part of the electorate of Hanover.

HADEN, a town of Germany, in the duchy of Holstein; fourteen miles east of Meldorf.

HADEN. See GADEN.

HAD'ONFIELD, a town of the American States, in Hampshire county, Massachusetts, lying on the east side of the Connecticut river, nearly opposite Northampton, twenty miles north of Springfield, and ninety-seven west of Boston. The town consists of two long spacious streets, which run parallel with each other, and with the river.

HADMERSBEREN, a town of Germany, in Lower Saxony, and principality of Magdeburg; twenty miles south-west of Magdeburg.

HADMEBAID, or HADLEIGH, or HADLEIGH, a large and populous town in the county of Suffolk, in the province of Suffolk, with a good market on Saturdays and fairs annually, viz. Whit-Monday and October 10. The town is seated in a fertile valley, on the river Brett; twenty-two miles south-east of Bury, and sixty-four north-east of London. Here is a large and handsome church, adorned with a noble spire; and a small chapel for the use of the almshouses, of which there are several for decayed housekeepers. It contains about five hundred houses; streets handsome; and inhabited by about three thousand persons. Large quantities of yarn are spun here; and this town had once a considerable woollen-manufactory, which is now decayed. A Sunday-school has lately been established, and is well supported by subscription.

HAD'LIEGH, or HADLEY, a large and populous town in the county of Suffolk, with a good market on Mondays, and two fairs annually, viz. Whit-Monday and October 10. The town is seated in a fertile valley, on the river Brett; twenty-two miles south-east of Bury, and sixty-four north-east of London. Here is a large and handsome church, adorned with a noble spire; and a small chapel for the use of the almshouses, of which there are several for decayed housekeepers. It contains about five hundred houses; streets handsome; and inhabited by about three thousand persons. Large quantities of yarn are spun here; and this town had once a considerable woollen-manufactory, which is now decayed. A Sunday-school has lately been established, and is well supported by subscription.

HADSTERFORD, a town of Germany, in the archduchy of Austria, situated on the river Kamp: eleven miles south-east of Meldorp.

HAD'JI BES'TASH, a town of Asiatic Turkey, in the province of Kandiah: thirty-two miles north-north-east of Christinas.

HADJREMOUIN, a town of Norway, in the diocese of Trondhjem.

HAD'TON, a town of the American States, in Gloucester county, New Jersey, nine miles south-west of New York.

HAD'GAR, a town of the American States, in the province of Ohio: thirty-six miles south-south-west of Sonneburg, and twenty-eight north-east of Bergen.

HAD'GAR, or HADGER, or HADGER, a seaport of Denmark, situated on a bay of the Baltic, in the duchy of Skelwich. The harbour is only adapted for small vessels. The passage from Lolland to the island of Funen is its principal support; twenty-four miles east of Copenhagen. Lat. 55°. 15. N. Lon. 9°. 25. E. Greenwich.

HAD'GAR, a town of the American States, in Connecticut: thirty-six miles south-east of Bergen.

HADIGI BES'TASH, a town of Asiatic Turkey, in the province of Kandiah: thirty-two miles north-north-east of Christinas.

HAD'LEIGH, or HADLEIGH, or HADLEIGH, a large and populous town in the county of Suffolk, in the province of Suffolk, with a good market on Saturdays and fairs annually, viz. Whit-Monday and October 10. The town is seated in a fertile valley, on the river Brett; twenty-two miles south-east of Bury, and sixty-four north-east of London. Here is a large and handsome church, adorned with a noble spire; and a small chapel for the use of the almshouses, of which there are several for decayed housekeepers. It contains about five hundred houses; streets handsome; and inhabited by about three thousand persons. Large quantities of yarn are spun here; and this town had once a considerable woollen-manufactory, which is now decayed. A Sunday-school has lately been established, and is well supported by subscription.

HAD'LEY, a town of the American States, in Hampshire county, Massachusetts, lying on the east side of the Connecticut river, nearly opposite Northampton, twenty miles north of Springfield, and ninety-seven west of Boston. The town consists of two long spacious streets, which run parallel with each other, and with the river.
2. *Haemanthus punicus*, waved-leaved haemanthus, or blood-flower; leaves oblong, elliptic, acute, reniform, waved; umbel contracted, falcate, border and stamens erect. Roots composed of many thick fleshy tubers, forming a head, out of which arises a fleshy spotted stalk, spreading at top into several spear-shaped leaves, which are waved on their edges. Stalks a foot high; leaves fix or eight inches long, and two broad in the middle. From the side of the stalk near the ground breaks out a strong fleshy scape, fix or eight inches long, with a large cluster of yellowish red flowers at the top. This is a native of Africa; it was received from Holland, and cultivated in 1722 at Lisbon by James Sherard, M.D.

3. *Haemanthus pubescens*, or downy-leaved haemanthus; leaves oblong-lanceolate, hirsute, on every fide; umbel falcate-rounded, border and stamens erect. Found at the Cape of Good Hope by Thunberg and Maffon. It flowers in August.

4. *Haemanthus ciliatus*, or fringed haemanthus; leaves lanceolate, smooth, ciliate, involucro broad, shorter than the rounded umbel, border reflex. It is a native of the Cape of Good Hope, but was received the roots from Dr. Adrian Van Royen, professor of botany at Leyden.

5. *Haemanthus toxicarius*, or fan-leaved haemanthus; leaves linear, keeled. Native of the Cape. Mr. Miller received the roots from J. J. Boulenger, in which thefes roots, with the African Gladiolus, *Ixia*, Persian Cyclamen, *&c.* are planted in the full ground, they will flower more conflantly, and the foot-flats will rise much higher, than those kept in pots. The second fort is also a native of the Cape of Good Hope, from whence it was first brought to Holland, where it has been propagated and dispersed over Europe; this may be propagated by parting the roots; and the best time for this is in the spring, before the plants put out new falkes, which is also a right time to fill the new-pot them; but, as the roots do not multiply very fast in offsets, the best way is to propagate them from seeds, which they ripen plentifully in England; there they are soon fown after they are ripe, in pots filled with light earth, and kept in the flovre all the window time; and when these pots are plunged into the tan-bed in the dark-flower, in the vacancies between the plants, the earth will be kept warm, and will not dry so fast as when they are placed in a dry flovre, fo the feds will be fooner prepared to vegetate; in the spring the pots may be taken out of the flovre, and plunged into a hot-bed, which will bring up the plants; there must have admittance to them every day in mild weather; to prevent their curving up and turning yellow, if they are to be removed, they may be each planted in a separate fmall pot filled with light earth, and plunged into the hot-bed again, to promote their taking new root; then they must be gradually hardened, and afterwards may be removed into the dry flovre, where they should containly remain, otherwise the plants will not thrive and flower in this country. In this country the flowers fparingly flower in the fall, when much wet, for as their roots are fleshy and faculent, they are apt to rot with moisture. In the summer they must have a large share of air in warm weather, and require to be frequently watered, especially during the time of their flowering.

6. *Haemanthus spiralis*, or spiral-flaked haemanthus; leaves bristle-shaped, fcape filiform, at the bafe fpiral and flexuous; involucres fubulate, fhorter than the umbel, which bears from one to four flowers. A native of the Cape, and flowers with us in September.

7. *Haemanthus carinatus*, or keeled haemanthus; leaves linear, keeled. Native of the Cape. Mr. Miller received the roots from J. J. Boulenger, in which thefes roots, with the African Gladiolus, *Ixia*, Persian Cyclamen, *&c.* are planted in the full ground, they will flower more conflantly, and the foot-flats will rise much higher, than those kept in pots. The second fort is also a native of the Cape of Good Hope, from whence it was first brought to Holland, where it has been propagated and dispersed over Europe; this may be propagated by parting the roots; and the best time for this is in the spring, before the plants put out new falkes, which is also a right time to fill the new-pot them; but, as the roots do not multiply very fast in offsets, the best way is to propagate them from seeds, which they ripen plentifully in England; there they are soon fown after they are ripe, in pots filled with light earth, and kept in the flovre all the window time; and when these pots are plunged into the tan-bed in the dark-flower, in the vacancies between the plants, the earth will be kept warm, and will not dry so fast as when they are placed in a dry flovre, fo the feds will be fooner prepared to vegetate; in the spring the pots may be taken out of the flovre, and plunged into a hot-bed, which will bring up the plants; there must have admittance to them every day in mild weather; to prevent their curving up and turning yellow, if they are to be removed, they may be each planted in a separate fmall pot filled with light earth, and plunged into the hot-bed again, to promote their taking new root; then they must be gradually hardened, and afterwards may be removed into the dry flovre, where they should containly remain, otherwise the plants will not thrive and flower in this country. In this country the flowers fparingly flower in the fall, when much wet, for as their roots are fleshy and faculent, they are apt to rot with moisture. In the summer they must have a large share of air in warm weather, and require to be frequently watered, especially during the time of their flowering.

**Hematemesis**, f. [from *aem*, Gr. bowel, and *emesis*, vomit.]: A vomiting of blood.

**Hematites**, or Blood Stones, f. in mineralogy, a fpecies of ferrum, or iron ore, of fufficient hardness to burnifh metals. The Greeks called iron ore in general by this name, from its fuppofed efficacy in stopping blood. See the article Mineralogy.

**Hematoccle**, f. [from *aem*, Gr. bowel, and *kala*, a tumour.]: A tumour occafioned by a collection of blood in the tunica vaginalis of the fcrotum. An aneurism is also fo named.

**Hematoclyside**, f. [from *aem*, Gr. bowel, and *clysis*, to pour out.]: An haemorrhage or flux of blood.

**Hematomphalocele**, f. [from *aem*, Gr. bowel, *mphalos*, the navel, and *kala*, a tumour.]: A tumour occafioned by an excreta in the navel about the year.4

**Hematophlegmatistrates**, f. [from *aem*, Gr. bowel, *phlegma*, a vein, and *statr, statation.]: A fuppreffion of the current of blood in the veins: a dwelling of the vein by reafon of fuch ftoppage.

**Hematopyrus**, f. [from the *aem*, Gr. bowel, and *pyrus*, the foot; fo named by Belon becaufe the feet (and bill) are of a billow colour.]: In ornithology, the Oyster-catcher; a genus of birds of the order of grallae. The generic characters are: Bill comprefled, the tip of an equal wedge shape; noftrils linear; tongue a third shorter than the bill; feet curfory, three-toed, cloven.

Hematopus oftralegus, the pied oyster-catcher, or sea-pie, a single species. This bird inhabits almoft every fea-shore. Its black and white plumage, and its long bill, have given occasion to the inaccurate appellations of sea-pie and sea-woodcock; the name oyster-catcher is proper, fince it expresses its mode of fubftanting. Catesby found oysters in its stomack, and Willoughby entire limpets. The organ of digefion is fpacious and mufcular, the border is more made either that the flefh of the bird is black and hard, and of a rank taste. Yet M. Bailion avers, that the oyster-catcher is always fat in the winter, and that the young ones are pleafant food. He
1. The Red Oyster Catcher. 2. Branch of the Legwood Tree. 3. The Hermit Crab.
He kept one more than two months in his garden, where it lived chiefly on earth-worms like the curlews, but also on raw flesh and bread. It drank indiscriminately either salt or fresh water, without shewing the least preference to either; yet in the state of nature these birds never inhabit the marshes or the mouths of rivers; they remain constantly on or near the sea-beach; probably because fresh waters do not afford the proper sufficiency for them. The oyster-catcher makes no nest; its eggs, which are greyish and spotted with black, lay on the naked ground, out of the reach of the tide, but without any preparation for their reception; it only seems to select a high point, fixed with fragments of shells. The number of eggs is usually four or five, and the time of incubation twenty-one days; the young fly not till the feet are firm, and the first farces in this respect, to do as most of the birds that inhabit the sea-shores, and to leave the hatch at the sun's heat part of the day, quitting her charge at nine or ten o'clock of the morning, and not returning, unless on occasion of rain, till three in the afternoon. The young, when they have hatched the shell, are covered with a black down. They crawl on the first day; they soon begin to run, and then they conceal themselves as well in the tufts of grass, that it is difficult to find them. The bill and feet of the oyster-catcher are of a fine coral red; hence Belon denominated it *haematopus*. Its feet and toes are covered with a rough and hard scale. The outer and middle toes are connected together by the first joint, and by a short membrane; by which, and disjunct from all others. None indeed of the shore birds has, with the stature of the oyster-catcher, and its short legs, the same form of bill, or the same habits and economy. This bird is as large as the crow; its bill four inches long, contracted, and, as it were, compressed vertically above the nostrils, and flattened at the sides, like a wedge as far as the tip, whose square section forms a cavity, a furcation, which enables its bill to raise up and detach the oysters, limpets, and other shell-fish, from their beds and rocks. It is also one of those few birds which have only three toes. This singular circumstance has led some authors to range it next the buffard. Yet it is apparent how wide is the separation in the order of nature; for not only this bird haunts the sea-shores, it even flies, though its feet are almost entirely devoid of membranes. It is true that, according to M. Brillon, who observed the oyster-catcher on the coasts of Picardy, its method of swimming is merely passive, but it has no aversion to repose on the water, and leaves the sea for the land whenever it chooses.

**HEMATO'SIS, f.** [from a'ma, Gr. blood.] An hemorrhage or flux of blood.

**HEMATOXYLUM, f.** [from a'ma, Gr. blood, and xylon, wood.] Logwood; in botany, genus of the chas decandria, order monogynia, natural order of lomentaceae, (leguminosae, jujf.) The generic character—Calyx: perianthium one-leaved, coloured: tube very short, pistil-1aped, filiform, permanent; flower five-parted, spreading, deciduous: parts oblong, blunt; the fourth upper ones equal, the lowest a little longer than the rest. Corolla: petals five, lanceolate, broadest at top, blunt, veined, spreading, nearly equal, inserted into the calyx, and larger than its divisions. Stamens: filaments ten, tubulate, hairy at bottom on the outside, unequal on the inside, inserted into the corolla, inserted into the calyx: anther oval, small. Pistil: germ oblong-fan-shaped, compressed; style capillary, bent at the tip, longer than the flower; stigma funnel-shaped. Pericarpium: legume lanceolate, flat, blunt, one-celled, edged on each side with a thick lip, where the valve does not open, opening by the bursting of the valves in the middle longitudinal line, and divided into two unequal boat-shaped parts. Seeds few, oblong, compressed, furrowed, fixed to one of the future.—Egg's Character. Calyx, five-parted; petals, five; legume lanceolate, valves boat-shaped.

**HEMATOXYLUM campechianum**, logwood, bloodwood, *Hematoxyllum campechianum*, a single species. This tree grows naturally in the bay of Campeche, at Honduras, and other parts of the Spanish Weft Indies, where it rises from sixteen to twenty-four feet high. The stem is generally crooked, and seldom thicker than a man's thigh. The inner bark is red, and the wood is hard. Branches subdivided, flexuose, prickly, round, aly-coloured. Leaves pinnate: petioles alternate, pulateous, round, lanceolate, leaflets four pairs, on very short petiolules, generally obcordate, entire, small, veined, very smooth and shining, spreading in the day-time, but at night upright, converging. Prickles strong, middling in size, above the petioles. Racemes axillary, simple, upright, the length of the leaves, solitary, many-flowered. Peduncles pedunced, numerous, small, pale yellow; on short, scattered, simple, colored, imbricate bell-shaped at the base and very small, the parts lanceolate, convex, reflex; purple; the bottom nectareous. Petals ovate, blunt, equal, with short claws. Anthere incumbent, revolute. Germ lanceolate, on a short pedicel. Stigma dilated, perforated. It flowers in March and April, and ripens its seeds in July.

**Logwood;** was first brought from the Spanish Main, but the event did not fully answer the benevolent intentions of those who first cultivated it. It makes an impenetrable and beautiful fence. The smaller limbs are made into hoops. Both the bark and gum are gentle subfringents; but the latex excels, and adds a sweetness to its virtues, which makes it more amiable to the palate.

The seeds are frequently brought from America, which, if sown, readily grow when sown upon a hot-bed, and if the plants are kept in a moderate hot-bed, they will grow to be up to a foot high the same year, and, while the plants are young, they are generally...
nerally well furnished with leaves; but afterwards they make but little progress, and are frequently but thinly clothed with leaves. These plants are very tender; so should be constantly kept in the bark-stove, where, if they are duly watered, and the stove kept in a good degree of heat, the plants may be preserved very well.

In the West Indies it thrives best in low swampy lands, and the interior firm.

In the Weft Indies it thrives best in low swampy lands, and the interior firm.

Triandria, order monogynia. Generic characters—Pe-

HÉMORRHAGIA, f. [from ausa, blood, and phýs, to flow.] The piles; a discharge of blood from the lower part of the rectum.

HÉMORRHOIIDS, f. [from ausa, blood, and phýs, to flow.] The piles; a discharge of blood from the lower part of the rectum.

HAEMODORUM corymbosum, a single species. It inhabits Audrafa.

HAEMON, a Theban youth, son of Creon, who was so captivated with the beauty of Antigone, that he killed himselp on her tomb, when he heard that she had been put to death by his father's orders. Property.

HAEMOPTYSIS, f. [from ausa, blood, and stýps, to spit up.] A spitting of blood.

HAEMOSTAT'SIA, f. (from the Greek haimostat, to stand. ] A disease arising from the stagnation of blood. HAEMOSTATIC, adj. [from the Greek haimostatica, from ausa, blood, and stýps, to stop.] Styptics, or medicines which stop hae-

HAEMOSTAT'ICAL, adj. (from the Greek haimostatiká, pertaining to the haemostatics) 

HERET'ICO COMBUREN'DO, a writ that lay against an heretic, who having been convicted of heresy, by the bishop, and abjured it, afterwards fell into the same again, or some other, and was therefore delivered over to the secular power. By this writ, grantable out of the court of chancery, upon a certificate of such conviction, he was committed to the secular power. By this writ, grantable out of the court of chancery, upon a certificate of such conviction, he was committed to the secular power.
In 1599, Haarlem was erected into a bishopric by Pope Paul IV, at the desire of Philip II, king of Spain. The cathedral is a magnificent structure, and is said to be the largest church in Holland; it was built towards the end of the fifteenth century, by Albert count of Holland. The tower, which is very handsome, was built in 1516. The bishopric of Haarlem comprehended Amsterdam, Alkmaar, Monnikendam Edam, Turmerland, Hoorn, Enkhuizen, and Medanbick; besides many inferior towns and villages, and seventy-two monasteries.

Haarlem remained an episcopal see for twenty years, when the reformed or Calvinistic mode of worship was established; but the adherents of the Roman-Catholic faith are still very numerous; and they inscribe the letter B on the front of their houses, to save the established clergy the trouble of knocking at their doors in the course of their pastoral visits to their own fraternity.

The Anabaptists are also very numerous at Haarlem, where the sect is known by the name of which anywhere men of more liberal sentiments, or who understand the true spirit of Christianity better, than many of the Dutch Mennonites.

There is nothing at Haarlem more deserving the attention of the curious than the organ in the great church, which is universally allowed to be a chef d'oeuvre of different birds; and the kettle-drum stop is beyond all the practices and returns of ignominy, cruelty, and baseness, which leaves an indelible stain.

To cultivate the manufactures of Holland; to encourage the manufactures of the city, and the priests. But the fate of Haarlem served only to inspire the Hollanders with the most desperate valour; and the failure of the siege of Alkmaar, together with a victorious battle, the Zealanders over the Spaniards, filled the haughty mind of Alva with disgust at the service; and, being moreover piqued at the refusal of reinforcements from Spain, he demanded his recall. It is said that this remonstrance Tyrant boasted, at the time of his resignation, that within the period of six years, he had made no less than eight thousand heretics suffer by the hands of the hangman.

Haarlem gave birth to Laurence Coster, who, the natives inflt, invented the art of printing; an honour, however, which Mentz and Stralsburg have disputed, with better pretensions. The house in which Laurence Coster lived is preserved with religious care, and adorned with the following inscription, in letters of gold:—

"Laurens Coster fecit anno 1470. Praeterea fecit anno 1499."

A statue has been erected to his memory in the botanic garden of Haarlem, which gave occasion to the following couplet:

*Ullus arte arte omnes linguaque renes, Et sparsa in medio lux lux nobilis fiuit.*

Haarlem has produced a number of excellent painters; and was once so celebrated as a school of painting, that it was called a second Bologna. The famous architect Van Campen, who formed the plan of the Hotel de Ville at Amsterdam, was a native of this city. Haarlem is said to excel every other place in bleaching linen; whence it derives a very considerable share of profit; and there are likewise flourishing manufactories here of thread, tape, damask-work, velvet, and silk. That useful and patriotism, which goes by the name of the Economical Society, was founded at Haarlem. Its object is to encourage the manufactures of Holland; to adopt the most effectual means for their improvement; and to reward the ingenuity and industry of artizans. The Teylerian Society is well known to all the literati of Europe; and under its auspices the republic of letters has been enriched by many valuable productions.

Haarlem has profited a good deal by the passion for flowers, which has been carried to such a height that a tulip-root has been known to fall for not less than four thousand florins. The Haerlem bulbs are still of the most valuable; and are the most celebrated parterres upon the continent; and the flower-gardens in the environs of this city in the months of April and May exhibit a most beautiful appearance. Mr. Dutens says he saw a hyacinth, in May, 1771, for Mr. Dutens says he saw a hyacinth, in May, 1771, for

The city of Haarlem is of a square form, and is said to contain about 45,000 inhabitants. The streets and buildings are for the most part handsome; the market-place is spacious, and has an air of considerable grandeur. The stadhoufe is a noble building, situated at one end of the market-place; and in it are many valuable pictures; among the rest, the first painting in oil by Eyvert, in 1437, which during the siege was sold for a few florins, and is now valued at two thousand pounds. There are four Dutch churches, one French, one Lutheran, one Armenian, and four Anabaptists, besides private chapels for the Roman Catholics. It is situated ten miles west of Amsterdam. Lat. 52° 22' N. Lon. 22° 2' E. Metro.
necked, and surrounded with a single row of prickles. One species only hath as yet been discovered, viz. Hercaucus nutis; body greyish-white, and wrinkled. It inhabits the interines of the mutton, and is distinguished from the genus Echinorhynchus, in wanting the retractor of the proboscis. This curious worm is shewn, very greatly magnified, in the correspondent engraving. HAFARVA, one of the Friendly Islands, in the Southern Pacific Ocean, about five leagues north-north-east of Amamocoo.

HAFAR, a town of Peru, in the province of Chucu: thirty-six leagues south of Sura.

HAFDALE, a town of Norway, in the diocese of Drontheim; fifty miles north-east of Rosenda.

HAFFSTADTEN, or Haffettten, a town of Germany, in the circle of Upper Saxony, and principality of Coburg; five miles east of Coburg.

HAFNERZELL, a town of Germany, in the circle of Bavaria, and bishopric of Passau; eight miles east of Passau.

HAFT, f. [haf, Sax. hafa, Dut. Dut. from to have or hold.]
A handle; that part of any instrument that is taken into the hand. —The extremities of the joints are the hafts and handles of the members. Duf/e/hay.

This brandished dagger, I'll bury to the haft in her fair breast. Dryden.

To HAFT, v. a. To set in a haft. Ainifworth.

HAFTING, f. The act of putting on a haft. Ainifha.

HAG, f. [Haggre, Sax. a goleone; gridle, Dut. a witch, a hag; a hag; the miller;
Thus spoke he impatiently, and made a pause: His foul gasp rais'd their heads, and clapt their hands; And all the powers of hell, in full applause, Flourish'd their snakes, and toll their flaming brands. Cowhaw.

A witch; an enchantress. —Out of my door, you witch! you hag, you baggage, you pouclet, you runnion. Shakeffpeare.

An old ugly woman. Such fictions may become the young; But thou, old hag, of three score years and three, Is shewing of thy parts in Greek for thee? Dryden.

A kind of fiery meteor, which appears on men's hair, or on the manes of horses.

To HAG, v. a. To torment; to harass with vain terror. —How are superflitious men kagged out of their wits with the fancy of omens, tales, and visions! L'Egrange.

That makes them in the dark fee visions, And hags themselves with apparitions. Huttles.

HAG, f. [from haggy, old Eng.] A dale. —This said, he led me over holts and hags. Fairfax. —This is not given as a general interpretation of the old English hag; which seems to have had other meanings; but if Fairfax has faithfully translated his original Tattlo in this line, holts and hags must mean hillys and hollows. Mason's Suppl. to Johnson.

HAG'S-HEAD, a cape of Ireland, on the western coast of the county of Clare: seventeen miles west from Correfhin. Lat. 52. 35. N. lon. 9. 24. W. Greenwich.

HAGA, f. [Saxon.] A manion; a dwelling. Scott.

HAGAN, f. [Heb. a stranger.] A woman's name. HAGARENS, or Hagarites, [from Hajar, the mother of Jethen.] The descendants of Jethen, called by the general name of Arabians. They dwelt in Arabia Felix, according to Pliny. Strabo joins them with the Nabateans, and Chavoteans, whose habitation was in Arabia Deferta. Others think their capital was Petra, otherwise Agra, in Arabia Petraea. The author of the 23d Psalm, v. 6. joins them with the Moabites; and in the Septuagint it is said (1 Chr. v. 10.) that the sons of Reuben, in the time of Simeon, made war against the Hagarites, and became masters of their country eastward of the mountains of Gilead. This therefore was the true and ancient country of the Hagarites. When Tarijan came into Arabia, he beleaguered the capital of the Hagarites, but could not take it. The sons of Hagar valued themselves of old upon their wildness, as appears by Bag. lii. 23.

HAGARTOWN, in the American States, now called Elizabeth Town, which see. It has a considerable trade with the western country, and is situated in Washington county, Maryland; it is a post-town, twenty-six miles north-west of Frederick-town, seventy-three north-west-by-west-of Baltimore, and twenty-two south-west-by-west of Chambersburg, in Pennsylvania.

HAGEDORN (Frederic), a celebrated German poet, born in 1708, at Hamburgh, where his father refided as Danish minister for the circle of Lower Saxony. He received a liberal education, and showed an early talent for poetry. In 1726 he was sent to Jenne, where he applied for three years to the study of the law; but without neglecting the muses. A small collection of his poems was published at Hamburgh in 1759; and the same year, in order to push his fortune, he repaired to London with recommendations to the Danish ambassador baron Von Solenhall, and refided in that city till 1753; where he became acquainted with the genius and manners of the English nation, for which he ever afterwards entertained a high esteem. He translated the English writers with great fidelity; and Pope, next to Horace, was his favourite author. In 1753 he was appointed secretary to the society of British merchants at Hamburgh, to which he was recommended by his intimate acquaintance with the English language. For nearly ten years he devoted himself to poetry for his own amusement; but in 1758 he published the first book of his Fables, which made him better known. In 1750 appeared his masterly ridicule of modern pedantry, entitled The Man of Letters; and in 1742, a paraphrase of Pope's Universal Prayer. In 1743 he gave to the public his celebrated poem of Happinefis, which established his reputation as a moral poet; and this was followed in 1747 by A Letter to a Friend, which is an excellent commentary on the Nil Admirari of Horace; and in 1750 by the first collection of his scattered poems, to which was added the second book of his Fables. In the following year he attempted imitations of the bacchanalian fongs of the English. His productions in this fyle were published at Hamburgh in 1751; and many of them have been set to music for the harpsichord by Bach, Graun, Góper, and Graf. In this kind of writing he may be compared to Prior, whom he seems often to have imitated. He died in 1754, in the forty-fourth year of his age. Wieland, in the preface to his poetical works, calls him the German Horace. A complete collection of his works, with vignettes, was published at Hamburg in 1752; and several editions have appeared since that time.

HAGEN, a town of Germany, in the circle of Westphalia, and county of Mark, containing three churches, and some manufactures of cloth; six miles north-west of Araena.

HAGEN, a town of Germany, in the circle of Upper Saxony: in the island of Rugen: sixteen miles south-east of Bergen.

HAGENAU, a town of Germany, in the circle of Lower Saxony, and duchy of Schwerin: twenty-six miles south-west of Schwerin.

HAGENBACH, a town of France, in the department of the Lower Rhine: four leagues south-east of Landau, and ten and a half north-north-east of Strasburg.

HAGENBACH, a town of Germany, in the circle of the Lower Rhine, and palatinate of the Rhine: four miles north of Lauterburg, and twelve south-east of Landau. Lat. 48. 39. N. lon. 25. 54. E. Ferro.

HAGENBRUNN, a town of Germany, in the archduchy of Austria: four miles east of Kora-Newburg.
HAGENBURG, a town of Germany, in the archbishopric of Austria; nine miles north-east of Steyr.

HAGENBURG, a town of Germany, in the circle of Weptalia, and county of Schauenburg; fifteen miles west of Hanover, and forty-fix south-east of Bremen.

Lat. 52 32. N. lon. 25. 3. E. Ferro.

HAGENBURG. The entrance is a clafė octa-
dron, order mononyeca. General characters—Calyx two-
leaved; corolla five-petalled, flat; nectary five leaflets,
four times as short as the petals.

Hageua Abyssinica, the only species, described by
Mr. Bruce. It is a tree with annulate branches; leaves
crowded at the tip of the branches, interruptedly pinate
and incised. Flowers, cluster in long spikes, yellow,
be-
HAGARD, or HAGARD, adj. [hagard, Fr.] Wild; untamed; irreclaimable:

She's too disdainful;
I know her spirits are as coy and wild,
As hagard as the rock. —Shakespeare.

[Ha'er, German.] Lean; rugged; ugly.—A hagard cation of a wolf, and a jolly sort of dog, with good flesh upon's back, fell in company together. L'Estrange.

Deformed with passion; wildly disordered:
Where are the conscious looks, the face now pale,
Now flushing red, the down-caft hagard eyes,
Or fixt on earth, or lowly rais'd! —Smith.

HAGGARD, f. Any thing wild or irreclaimable:
I will be married to a wealthy widow,
For her the rich Arabia Sweats her gum; —Sandys.

HAGGARDLY, adv. Deformedly; uglily:
For her the rich Arabia Sweats her gum;
And precious oils from distant Indies come,
How haggardly over the looks at home. —Drydon.

HAG'GEIN, a mountain of Switzerland, in the canton of Schwetiz, remarkable for its triple top, and frightful aspect: from it extends a chain, which separates this canton from Uri on the north, and Glaris on the east.

HAG'GLING, n. [from haggle. The aft of mangling; the aft of bargaining.

One that cuts. One that is tardy in bargaining.

HAGWORTH'INGHAM, [of haeg, a hedge, popS, and hag, a beggar.] A hedge in the town, over the allied army, and took 500 prisoners, and sixteen pieces of cannon. It is five leagues north of Biflritz.

HAG'YMAS, a mountain of Hungary: twenty miles north of Biflritz.
HAI, interj. An expression of sudden effort:

Her coats tuck'd up, and all her motions just,
She stamps, and then cries hail! at every thrust. Dryden.

HAI', f. [from the expression of surprise at the sight of it.] A canal of water, a wall, or some other fence that end of a walk, or sunk deep between two fences so as to be concealed till you are just come upon it.

HAI-HAN, a town of Arabia: one hundred miles south of Catham.

HAIHN (Simon Frederic), a German historian, born in 1664. In 1700, he settled in Hanover, where his father was minister. At a very early age he was a proficient in the languages; and when only fourteen, he pronounced a Latin harangue on the origin of the monastery of Bergen, which was printed. He soon after published the continuation of the Chronicle of Bergen by Meibomius, and its charter from Otho the Great. In 1725, he succeeded Eccard as historiographer and librarian to the elector of Hanover, the duties of which offices he discharged till his death in 1729. Besides various dissertations on subjects of German history, he wrote, in the German language, a History of the Empire, of which the first four volumes appeared in 1771. He also published Collectio Monumentorum velerum & recent, ineditorum, 2 vols. 8vo. See Ha-Chur.

HAI-RAS, a town of Egypt: twenty-one miles east of Trench.

HAI', or A'. 1. Gen. xii. 8. xiii. 3. See Ai. vol. i.

HAI', a town of China, of the second rank, in the province of Kiang-nan: three hundred and fifty miles south-east of Peking. Lat. 22. 38. 40. E. Ferro.

HAI-FONG', a town of China, of the third rank, in the province of Chantung: seventeen miles north of Vou-t'ing.

HAI-FONG', a town of China, of the third rank, in the province of Quang-tong: sixty miles east of Ho-chi-tcheou.

HAI-MEN', a town of China, in the province of Tche-kwang: twenty miles south of Tai-tcheou.

HAI-NAN', an island in the Eastern Sea, belonging to China, commencing at its southern extremity. The name of Hai-nan, i.e. the south of the sea, expresses its situation. It has been many years annexed to the province of Quang-tong (which, opposite to Hai-nan, juts far fouth in a peninsulated form), and is distant above sixty miles from the coast of China, about eight leagues long, and one and a half broad. Lat. 25. 35. N. Lon. 137. 25. E. Ferro.

HAI-CHAN'T-A'O, an island in the China Sea, near the south-west coast of Corea. Lat. 34. 30. N. Lon. 124. 18. E. Ferro.

HAI-CHE-BACH, a town of Germany, in the archduchy of Austria: four miles north-north-west of Erfarding.

HAI-DECK, a town of Germany, in Bavaria: twenty miles south of Nuremberg.

HAI-DING, a town of Germany, in the archduchy of Austria: four miles south of Eichering.

HAI-E, f. A net to catch rabbits. Anyworth.

HAI-FAR, a town of Palestine, near the coast of the Mediterranean, at the foot of Mount Carmel, and on the north side of a bay opposite Acre. It has no harbour, but tolerable good anchorage. Here are the ruins of a castle and two churches; of the latter one serves for a magazine, and the other for a caravandera. It is five miles south-east of Acre.

HAI-GERLOCH, a town of Germany, in the circle of Swabia, and county of Hohenberg: thirty-two miles south-south-west of Stuttgart, and forty-four south-east of Stralsburg.

HAIL, f. [hajel, Sax.] Drops of rain frozen in their falling. Locke.

Thunder mix'd with hail,
Hail mix'd with fire, must rend th' Egyptian sky. Milton.

Hailstones assume various figures, being sometimes round, at other times pyramidal, crested, angular, thin, and flat, and sometimes filettled, with fix radii like the small crystals of snow. It is very difficult to account for the phenomena of hail in a satisfactory manner; and there are various opinions upon this head. Signior Beccaria attributed the formation of hail to electricity, and supposes that it is formed in the higher regions of the air, where the cold is intense, and where the electric matter is very copious. In these circumstances, a great number of particles of water are brought near together, where they are frozen, and in the de-
fent they collect other particles; so that the density of the substance of the hailstone grows less and less from the centre; this being formed first in the higher regions, and the surface being collected in the lower. Accordingly, in mountains, hailstones as well as drops of rain, are very small; and both agree in this circumstance, that as motion promotes freezing, so the rapidity of the electrified clouds may promote that effect in the air.

Natural historians furnish various accounts of surprising hail, in which the hailstones are of extraordinary magnitude. Micah, speaking of the war of Louis XII. in Italy, in 1510, relates that there was for some time an unusual darkness; after which the clouds burst into thunder and lightning, and there fell a shower of hailstones, which destroyed all the fih, birds, and beasts, of the country. It was attended with a strong smok of fulphur, and a dye of a bluish colour, and of an immense size. And at Life in Flanders, in 1566, fell hailstones of a very singular kind, some of which contained in the middle a dark brown matter, which, thrown on the fire, detonated like gunpowder. Phil. Trans. No. 203.

Dr. Halley also relates, that in Cheshire, Lancashire, &c. April 29, 1693, a thick black cloud, coming from Carlisle, baffle-shaped and charging in such a manner, that for about the breadth of two miles, which was the limit of the cloud, in its progress for the space of sixty miles, it did inconceivable damage; not only killing fowls and other small animals, but splitting trees, knocking down horses and men, and even ploughing up the earth; so that the hailstones buried themselves and ground an inch or more. The hailstones, many of which weighed five ounces, and some half a pound, measuring five or six inches in circumference, of various figures; some round, others half round; some smooth, others embossed and crenated; the icy substance of them was very transparent and hard, but there was a snowy kernel in the middle of them.

In Hertfordshire, May 4, the same year, after a severe storm of thunder and lightning, a shower of hail succeeded, which far exceeded the former: some persons were killed by it, their bodies beat black and blue; vast oak trees were split, and fields of rye cut down as with a scythe. The stones measured from ten to thirteen or fourteen inches in circumference. Their figures were various, some oval, others angular, and some flat. Phil. Trans. No. 229.—See the articles, Snow.

To HAIL, v. n. To pour down hail.—My people shall dwell in a peaceable habitation when it shall rain, coming down on the forest. J. S. xxxii. 19.

HAIL, interj. [lail, health, Sax. hail, therefore, is the same as jauor of the Latins, or χαλίς of the Greeks, health be to you.] A term of salutation now used only in poetry; but health to you. It is used likewise to things inanimate: Hail, hail, brave friend! Say to the king the knowledge of the broil. Shakespeare. Hail to the sun! from whose returning light The cheerful soldier's arms new lufure take. Rowe.

To HAIL, v. a. To salute; to call to. A galley drawing near into the harbour, was hailed by a Turk, accompanied with a troop of horsemen. Knolles.

Thrice call upon my name, thrice beat your breast, And hail me thrice to everlasting rest. Dryden.

HAILBRONN. See Heilbronn.

HAIL'ING, f. The act of calling a ship at a distance. HAIL'LAN (Bernard de Girard du), hiftiographer of France, born at Bourdeaux in 1535. He first became known as man of letters by some poems and translations; but giving all his attention to history, he was made hisf

torigrapher by Charles IX. in 1571, on which occasion he reowned Calvinisn, and conformed to the Roman-catholic religion. He was in the service of Henry III., and dedicated to him his History of France, for which he was rewarded by various honours and emoluments. He accompanied Henri de France, the future Louis XIV., on his em¬

bassy to England and Venice. He died at Paris in 1670, and was buried at St. Eulache. As a writer he is principally known for his History of France, from Pha¬

ramond to the Death of Charles VII. first published in several vols. 8vo. and reprinted in two vols. fol. 1627. It has the merit of being the first body of French history written in that language. In several respects it is writ¬
ten with freedom, and with a spirit superior to national prejudices; but in other instances it betrays credulity and a love of fable. Though it was much criticized, its free and fictitious call acquired it many readers. His work, De l'Etat & Suits des Affaires de France, 8vo. 1613, contains several curious details.

HAIL'SHAM, Hailsham, or Hail'sham, a small town in the county of Sussex, with a market on Saturdays, and fairs annually on April 5, and June 3. It lies fourteen miles east of Lewes, and fifty-sixth west, south-west from London.

HAIL'SHOT, f. Small shot scattered like hail. The matter of the artillery did visit them sharply with mur¬

dering hailshot, from the pieces mounted towards the top of the hill. Hailshot betrays a spirit superior to national prejudices.

HAIL'STONE, f. A particle of hail: You are no furer, no, Than is the coal of fire upon the ice, Or hailstone in the fun.

Shakespeare.

Hailstone lie not thicker on the plain, Nor shaken oak with fuch show's of acorns rain. Dryden.

HAIL'WORKFOLK, f. [i.e. holywork-folk.] Those who formerly held lands for the service of defending or repairing a church or monument. Bailey.

HAILY, adj. Confident of hail: From whose dark womb a rattling tempest pours, Which the cold North congeals to fairy flowers. Pope.

HAI'MEN, a town of the kingdom of Corea, in the province of Tchu-sin: ninety miles south-west of King¬

ktai. Lat. 37. 48. N. Ion. 144. 28. E. Ferro.

HAIN, a town of Germany, in Upper Saxony: five miles west, north-west of Gomha.

HAIN'A, a town of Germany, in the principality of Heife: seven miles west and north of Frankenberg, and twenty-four south-west of Raifs, and south of Caffel.

HAIN'NAUT, or Hainault, one of the provinces of the Catholic Netherlands, bounded on the north by Flanders and Brabant, on the east by Brabant, the coun¬

ty of Namur, and bishopric of Liege; on the south by France, on the west by Flanders and Flanders. Its greatest extent from north to south is about forty-eight miles, and from east to west about thirty. The air is healthful, and the soil produces corn in abundance. The rich paturages feed large herds of cattle, and the sheep yield plenty of wool. Its woods and forests supply timber for building, and fuel for burning. In it are mines of coal and iron, and quarries of beautiful marble, flate, and other very good and serviceable stone. The principal rivers are the Scheldt, the Selle, the Sambre, and the Dender. The time in which this pro¬

vince was raised to a county is not properly known. After the death of count Regnier IV. it descended, with his only daughter and heir, Richild, to Baldwin VI. count of Flanders, who was the first of that name among the counts. Count Baldwin VI. who died in 1250, left behind him two daughters, one of whom, named Margarete, was married to Burchard of Avesnes, and brought to him the county of Hainaut. Their great grandson, William II. died in 1315, without male heirs, upon which
which the county fell, together with his daughter Margaret, to the thare of the emperor, Louis of Bavaria. The last proprietor of it, defended from this house, was William IV., whole daughter, Jaqueline, after being four times married, died without heirs, in 1436; upon which Philip the Good, duke of Burgundy, arrived to the possession of the county. By the peace of the Pyrenees, France obtained the towns of Landrecy, Quefnoy, Avesnes, Marienburg, and Philipenville; by the peace of Nimeguen, Valenciennes, Bouchain, Condé, Cambrai, Bava, and Maubeuge, with their respective districts; and by the peace of Ryfwick, several villages. Mons is the capital.

HAINBURG, a town of Germany, in Bavaria, twenty-two miles north-west of Amberg, and ten north-west of Velberg.

HAINBURG, or HAIMBURG, a town of Germany, in the archduchy of Austria, situated on the Danube, with a manufacture of cloth. In 1482, it was taken by Matthias Corvin, king of Hungary; eight miles west of Velberg, and twenty east-fourth-east of Vienna. Lat. 45° 24' N, lon. 54° 6'. E. Ferro.

HAIN, a river of the Netherlands, which is navigable by means of sluices from Mons to Condé, where it joins the Scheldt.

HAINFELDEN, a town of Germany, in the archduchy of Austria; fourteen miles south-east of St. Pelag, and twenty-fourth-east of Vienna. Lat. 48° 5' N, lon. 9° 4'. E. Ferro.

HAIN, a town of Germany, in Swabia: ten miles north-west of Buchan, and twenty-one west-fourth-east of Ulm.

HAINNERSDORF, a town of Silesia, in the principal of Neiff, situated near the river Mitbach: five miles north-west of Weydenau.

HAINRICHSLAG, a town of Germany, in the archduchy of Austria: three hundred miles west of Brom.

HAINTAAL, a town of Germany, in the archduchy of Austria: four miles south-east of Laab.

HAINSTOTTEN, a town of Germany, in the archduchy of Austria: eight miles west-fourth-west of Ips.

HAIR, f. [harp, Six.] One of the common teguments of the body, and an emunctum. It is formed on all parts except the soles of the feet, and palms of the hands. Each hair has a round bulbous root, which lies pretty deep in the skin, and which draws its nourishment from the surrounding humours. They grow as the nails do, each part near the root thrusting forwarrd that which is immediately above it, and not by any liquor running along the hair in tubes, as plants grow. The life which enables them to grow, and the power which makes the hair soft, and the hair subject to the influence of the air, is possessed by the hair of the body itself. It is to be observed, however, that in very young persons the hairs of the head at first are covered with a fine down, and that when they begin to grow, they are covered with a kind of scale, which continues a long time after. In very young persons, the hairs of the head are generally more tender than those of other parts of the body. They are found on every part of the body, and in every sex, but not on the soles of the feet, and palms of the hands. They are usually colorless, and they divide into three classes, according to their length and fineness, which are termed the kinds, the forms, and the parts.

Hair, as contributing gracefulness and beauty of person, has, in all ages been governed by fashion and caprice. The Hebrews esteemed black hair as the most elegant and becoming. Absaloms hair was cut once a year, and it is said to have weighed two hundred shekels, by the kings weight, which is about thirty-one ounces. The hair of both Jewish and Grecian woman engaged a principal share of their attention; and the Roman ladies seem to have been no less sedulous with respect to theirs. They generally wore it long, and dressed it in a variety of ways, ornamenting it with gold, silver, pearls, &c. On the contrary, the men amongst the Greeks and Romans, and amongst the later Jews, wore their hair short, as may be collected from medals, statues, &c. This formed a principal distinction in dress between the sexes. This illustrates a passage in St. Paul's Epistle to the Corinthians. Cor. xi. 14, 15. St. Paul forbids the Corinthian women, when praying by divine inspiration, to have their hair dishevelled; probably because this made them resemble the heathen priestesses, when actuated by the pretended influence of their gods.

Among the Greeks, both sexes, a few days before marriage, cut off and consecrated their hair as an offering to their favourite deities. It was also customary amongst them to hang the hair of the dead on the doors of their houses previously interment. They likewise tore, cut off, and sometimes shaved, their hair, when mourning for their deceased relations or friends, which they laid upon the corpse, or threw into the pile, to be confounded with the body. Whatever was the fashion of the hair in the Grecian states, slaves were forbidden to imitate the freemen. The hair of the slaves was always cut in a particular manner, called 

It was esteemed a great honour among the ancient Gauls to have long hair, and hence came the appellation Gallia comata. For this reason Julius Caesar, upon subduing the Gauls, made them cut off their hair as a mark of submission. It was with a view to this, that such as afterwards quitted the world to go and live in cloisters, procured their hair to be shaven off; to show that they bade adieu to all earthly ornaments, and made a vow of perpetual suflention to their superiors.

Gregory of Tours affirms, that in the royal family of France, it was a long time the peculiar mark and privilege of kings and princes of the blood to wear long hair, which was to be poll'd, or cut round, in token of inferiority. Some, according to the regulations of the order of knighthood, were admitted to wear their hair long and uncut, and to be called Templars or Knights Hospitallers; others, who were not so fortunate, and who wore it at full length, to the slave who was quite cropped. To cut off the hair of a son of France, under the first race of kings, was to declare him excluded from the right of succeeding to the crown, and reduced to the condition of a subject.

The elegance of long hair became obnoxious in the progress of Christianity, as something utterly inconsistent with the profession of persons who bore the cross. Hence arose numerous injunctions and canons to the contrary. Pope Ancillus is commonly supposed to have been the first who forbade the clergy to wear long hair; but the prohibition is of an older standing in the churches of the east; and the letter wherein that decree is written, is of a much later date than that pope. The clerical tonure is related by Isidore Hipaleniis, as of apostolical institution. Long hair became at length fo odious, that a canon was published in 1096, importing, that such a person was to be expelled from the monasteries, and to be deprived of all temporal possessions. The French historians have been very exact in recording the history of hair of their several kings. Charlemagne wore it very short, his son shorter; Charles the Bald had none at all. Under Hugh Capet it began to appear again; this the ecclesiastics opposed, and excommunicated all who let their hair grow.

The ancient Britons were extremely choice of the length and beauty of their hair, and were at much pains in dressing and adorning their heads. Some of them carried their hair in a particular manner, which was remarked by long and beautiful, and that it might not be stained with his blood. There is scarcely a description of a fine woman or beautiful man, in the poems of Ossian, but the hair is mentioned.
mentioned as one of their greatest beauties. Not contented with the natural colour of their hair, which was commonly fair or yellow, they made use of certain dyes to render it still brighter. One of these was a composition of lime, the ashes of certain vegetables, and salts, mixed with various oils, to make the hair of their heads grow thick and long; which last was not only esteemed a great beauty, but was considered as a mark of dignity and noble birth. Bodicea, queen of the Britons, is described by Dio with very long hair, flowing over her shoulders, and reaching down below the middle of her back. The Britons shaved all their heads, except their upper lips; the hair of which they, as well as the Gauls, allowed to grow to a very inconvenient length.

In after-times, the Anglo-Saxons and Danes also considered fine hair as one of the greatest ornaments of their persons, and were at no little pains in dressing it to advantage. Young ladies wore their hair uncovered and untied, flowing in ringlets over their shoulders; but as soon as they were married, they cut it shorter, tied it up, and put on a head-dress according to the prevailing fashion. To have the hair entirely cut off was so great a disgrace, that it was one of the severest punishments inflicted on those women who were guilty of adultery. The Danes and Scots, for years together, applied upon the English, in the reigns of Edgar the Peaceable and of Ethelred the Unready, were the heroes of those times, and were particularly attentive to the dressing of their hair; which they combed at least once every day, and thereby captivated the affections of the English ladies. The clergy, both secular and regular, were obliged to have their hair cut off in a single swoop, which distinguished them from the laity; and several canons were made against their concealing their tonsure, or allowing their hair to grow long. The shape of this clerical tonsure was the subject of long and violent debates between the English clergy on the one hand, and those of the Scots and Picts on the other; that of the former being circular, the latter only semi-circular. It appears very plain, that long bowing hair was universally esteemed as a great ornament; and the tonsure of the clergy was considered as an act of mortification and self-denial, to which many of them submitted with reluctance, and endeavoured to conceal as much as possible. Some of them who affected the reputation of superior sanctity indulged in the long hair of the laity; and laboured earnestly to persuade them to cut it short, in imitation of the clergy. Thus the famous St. Wulstan, bishop of Worcester, is said to have declared with great vehemence against luxury of all kinds, but chiefly against long hair as most criminal and most universal. "The hair to our young gallants,- who, forgetting that they were men, had transformed themselves into women by the length of their hair. A certain knight, who was very proud of his long luxuriant hair, dreamed that a person suffocated him with its curls. As soon as he awoke from his sleep, he cut his hair to a decent length. The report of this spread over all England, and almost all the knights reduced their hair to the proper standard. But this reformation was not so long continued; for in less than a year all who wished to appear fashionable returned to their former wickedness, and contended with the ladies in length of hair." The fashion of wearing long hair was now retained by the men, until the enormous flowing white wigs came to be the vogue, which at once gave dignity to all ranks, from the king to the philosopher. White hair not being so easy to be got in quantity as their heads, and knowing how to charge the poor to their former wickedness, and contended with the

Anselm, archbishop of Canterbury, went so far as to pronounce the then terrible sentence of excommunication against all who wore long hair, for which pious zeal he was very much commended. Serlio, a Norman bishop, allowed the great holiness and prodigious eruptions he had received before Henry I. in 1104, against long and curled hair, with which the king and all his courtiers were so much affected, that they consented to resign their flowing ringlets, of which they had been so vain. The prudent prelate gave them no time to change their minds, but immediately pulled a pair of shears out of his fætce, and performed the operation with his own hand. Another incident happened shortly after, which gave a temporary check to the prevailing fondness for long hair. It is thus related by a contemporary historian: "An event happened, A.D. 1129, which seemed very wonderful to our young gallants; who, forgetting that they were men, had transformed themselves into women by the length of their hair. A certain knight, who was very proud of his long luxuriant hair, dreamed that a person suffocated him with its curls. As soon as he awoke from his sleep, he cut his hair to a decent length. The report of this spread over all England, and almost all the knights reduced their hair to the proper standard. But this reformation was not so long continued; for in less than a year all who wished to appear fashionable returned to their former wickedness, and contended with the ladies in length of hair." The fashion of wearing long hair was now retained by the men, until the enormous flowing white wigs came to be the vogue, which at once gave dignity to all ranks, from the king to the philosopher. White hair not being so easy to be got in quantity as their heads, and knowing how to charge the poor to their former wickedness, and contended with the ladies in length of hair.

The tale is thus related by a contemporary historian: "An event happened, A.D. 1129, which seemed very wonderful to our young gallants; who, forgetting that they were men, had transformed themselves into women by the length of their hair. A certain knight, who was very proud of his long luxuriant hair, dreamed that a person suffocated him with its curls. As soon as he awoke from his sleep, he cut his hair to a decent length. The report of this spread over all England, and almost all the knights reduced their hair to the proper standard. But this reformation was not so long continued; for in less than a year all who wished to appear fashionable returned to their former wickedness, and contended with the ladies in length of hair." The fashion of wearing long hair was now retained by the men, until the enormous flowing white wigs came to be the vogue, which at once gave dignity to all ranks, from the king to the philosopher. White hair not being so easy to be got in quantity as their heads, and knowing how to charge the poor to their former wickedness, and contended with the ladies in length of hair.

The tale is thus related by a contemporary historian: "An event happened, A.D. 1129, which seemed very wonderful to our young gallants; who, forgetting that they were men, had transformed themselves into women by the length of their hair. H A I R.

Hair, or H ay r, a country of Africa, in the desert of Sahara. Lat. 23. N. lon. 2. 30. E. Greenwich.

Hair-brained, adj. ['This should be written har-brained.']
Hair-powder was made by mixing a variety of materials, including darch. A statute of 35 Geo. III. c. 49, compelled every person who minded to wear hair-powder to take out a licence for that purpose. The statute also limited the annual income of those who manufactured or sold hair-powder to one guinea per annum. This was a significant restriction, as hair-powder was a common and expensive product.

The practice of wearing hair-powder was not limited to the nobility. Commoners also used hair-powder to mask the effects of hair loss or to change their appearance. It was a status symbol, indicating wealth and sophistication. However, it also led to health problems, as the fine powder could irritate the scalp and cause respiratory issues.

Hair-powder was often used to create a smooth, glossy appearance. The ancient Egyptians used a similar product, known as “Hair of the Gods,” which was made from the feathers of geese. In the Middle Ages, hair-powder was used to mask hair loss and to create a smooth appearance. However, by the 17th century, the use of hair-powder had become widespread among all classes of society.

The manufacturing of hair-powder was a profitable business, and it attracted many entrepreneurs. The hair-powder industry was highly regulated, and manufacturers were required to obtain a licence and pay a tax on their production. This was a significant burden for many small manufacturers, and it contributed to the rise of large-scale production.

The use of hair-powder continued to evolve throughout the 17th and 18th centuries. It was used to create a variety of styles, from the smooth, glossy look of the ancients to the more elaborate styles of the 18th century. However, the health problems associated with hair-powder continued to be a concern, and it eventually fell out of fashion.
HAL OFEN, a town of Bohemia, five miles north-west of Budweis.

HAKLUYT (Richard), one of the first English collectors of voyages and travels, born at London in 1553. He was educated at Wealfminster school; and, during his residence there, being accustomed to visit, at his chambers, the Temple, his cousin Richard Hakluyt, esq., of Eyton, a person greatly attached to navigation and commerce, he acquired such a taste for geographical and maritime enquiries, that it became his ruling passion. After being entered at Christ-church, Oxford, he engaged in a course of reading on those topics in a variety of languages, by which he rendered himself so conspicuous, that he was appointed to read public lectures upon cosmography and the collateral sciences. In 1583, having taken orders, he was engaged as chaplain to Sir Edward Stafford in his embassy to France, in which country he remained five years. At Paris he procured, at his own expense, the publication of a French account of Florida, edited by Martin Buchaner, a professor of mathematics. This he translated into English, and published in 1587, with a dedication to Sir Walter Ralegh, one of the corporation of counsellors, assistants, and adventurers, to whom he alligned his patent for the prosecution of discoveries in America. He thereupon set himself to the collection and arrangement of all the accounts and documents of voyages by English navigators, which, in 1589, he published in 1 vol. folio, under the title of, The principal Navigations, Voyages, and Discoueries of the English Nation, made by Sea or over Land. This collection was augmented by two more volumes, the last printed in 1600. In 1601 he published a translation from the Portuguese of, Antonio Galvano's History of Discoveries, 4to. He was appointed in 1605 to a prebendal stall at Wealfminster, which, with a residence in the county of Werningierode; and on the west by the bishopric of Hildesheim: in its greatest extent from east to west about thirty-six miles, and twenty-eight from north to south. This principality is for the most part level, but contains some eminences, though few hills. The soil is extremely fertile, but contains few affurages and meadows. The graziers also are considerable, and their large breeds of sheep afford plenty of wool. On the other hand, the woods are continually leaening, and at present the want of fuel is so great, that even straw and stubble are fed for it; yet the coal-pits are but little worked. Game is scarce, and the country has little water in it of any considerable extent. The greater part of the inhabitants are Lutherans. The churches of that religion are divided into eleven inscriptions, over which is a general superintendence. The Calvinists and Roman catholics are considerable in number. The latter are prohibited from making converts; as the convents, by an ordinance from 1702, were from purchasing immovable estates. The Jews are tolerated to a fixed number of families. The woollen manufactures established in this country are in a thriving condition. The principality of Halberstadt derives its origin from the ancient bishopric of that name. The emperor, Charles the Great, is said to have intended the erection of the see, but it did not take place till under his son, Louis I. and its first bishop was Hildegrin, who was consecrated in the year 814. At the treaty of Westphalia, in 1648, the diocefe was transferred to the electoral house of Brandenburg as a temporal principality. But it was at that time in a bad situation, most of the eftates and bailiwicks belonging to it being alienated. By good management, however, these were gradually redeemed. HALBERSTADT, a city of Germany, and capital of the principality to which it gives name. The buildings are mostly old and irregular. The inhabitants do not much exceed 1300, notwithstanding which, within and about the town are sixteen churches. Peterhof, formerly the episcopal residence, is at present the place of the public offices. The records, together with the funds of several taxes, and likewise of the deaneries, are also kept there. The cathedral, or St. Peter's, is an old but lately building, constructed of a very hard freestone. The chapter is composed of a provost, a dean, a subdean, and sixteen canons, of whom four are Roman catholic, but all the others Lutherans. In 1710, the town was reduced to ashes by the army of Henry the Lion, in revenge of an injury done to him and his territories by bishop Ulric. In 1733, it was walled and moated. The increase of its inhabitants occasioned the building of two suburbs, the housekeepers in which are put on the same footing with the town burghefs. Towards the beginning of the eighteenth century, another suburb was added to it. In 1754, the walls which environed near one half of this city, were pulled down, and the moats filled up, so as to form a level, which has been converted into a plantation of mulbery-trees. In 1758, Halberstadt was very severely treated by the French, who demolished its gates, and likewise its walls for eight hundred rods in length. Thirty miles south-west of Magdeburg, and thirty-

HALBERTED, adj. Armed with a halberd:
But if in this reign
The halbered train
Or confable should rebel. Loyal Songs.
HALCION, f. [halcoy, Lat.] The trivial name of the Kingfisher; of which it is said, that the breeds in the sea, and that there is always a calm during her incubation. See also vol. i. p. 217.
Amidst our arms as quiet you shall be,
As halcyon brooding on a winter sea. Dryden.
HALCION, adj. Placid; quiet; still; peaceful.—No man can expect eternalcermony and halcyon days from fo incompetent and partial a cause, as the constant course of the fun in the equinoctial circle. Bentley.
When great Augustus made war's tempest cease,
His kalyen days brought forth the arts of peace. Denham.
HALCZYN, a town of Poland, in the palatinate of Bracal: twenty-miles east-south-east of Bracal.
HALDE (John-Baptist du), born at Paris in 1674.
Having entered into the society of Jesuits, he was entrusted with the care of collecting and arranging the letters sent by the society's missionaries from different parts of the unconverted world. He died in 1749, after establishing a high character for mildness, piety, and industry, which he obtained from the love of the Latin poems and languages; but is chiefly known as the editor of the Lettres edifiantes et curieuses, from the ninth to the twenty-sixth collection inclusive, to which he added useful prefaces; and as compiler of the Description historiques, geographique, physis, de l'Empire de la Chine, & de la Tartarie Chinoise, 4 vols. folio, Paris, 1735; and 4 vols. folio, Haye, 1736. This has been translated into English with some retrenchments; and is a book in universal esteem.
HALDENSTEIN, a barony of the Grifons, near Coire.
HALDENSTEIN, a barony of the Grifons, near Coire, absolutely free and independent, under the protection of the three leagues. It belongs to the family of De Sali. It takes its name from an ancient castle, now in ruins; two miles north of Coire.
HALDENSLEBEN, a town of Germany, in the circle of Lower Saxony, and principality of Magdeburg: twelve miles north of Magdeburg.
HALF, adj. [should rather be written half, from hal, health.] Healthy; sound; hearty; well-complexioned:
To serve his integrity, and yet live securely, he resolved to follow two maxims of Atticus, whom he proposed to himself as a pattern, viz. "To engage in public service, and constantly to favour those that were oppressed." He often relieved the royalists under pernicious, which so affected the royal party, that he was constantly retained by them in his profession. He was one of the counsel to the earl of Strafford, archbishop Land, and even it is said to the unfortunate king Charles himself; as also the duke of Hamilton, the earl of Holland, the lord Capel, and lord Craven: but being esteemed of great knowledge in the law, he was employed by both parties, the parliamentarians as well as the royalists.
In 1643, to the utter astonishment of all men, the plain honest unpolitical Mr. Hale, who would attach himself to no party, subscribed what was called the solemn league and covenant. See the article COVENANT, vol. v. p. 288.
But still his conduct seems to have been directed by pure motives. He was now deputed to an active station, particularly on the reduction of the garrison at Oxford; and, as a lawyer, was added to the commissioners named by the parliament, to treat with those appointed by the king. In that capacity he rendered eminent service to the cause of literature, by his general desire to preserve that noble seat of learning from ruin. Afterwards, though he affected to be deeply grieved at the unfortunate death of Charles I. yet he took the oath called The Engagement; and, January 1651-2, was one of those appointed to consider the reformation of the law. Cromwell, who knew the advantage it would be
to have the countenance of such a man as Hale to his courts, never left importuning him, till he accepted the place of one of the justices of the common bench, as it was then called; for which purpose he wrote a letter to judge serjeant at law, January 25, 1653-4. In that situation he acted with great integrity and independence. He had at first great scruples concerning the authority under which he was to act; and, after having gone two or three circuits, he refused to sit any longer on the side that was to try criminals. He had indeed acted formerly in a scrupulously conscientious manner, in punishing every species of cruelty and oppression, that the reigning powers opposed not his censure. Dr. Burnet records the following instance of his unshaken justice, while he thus presided on the bench. A trial was brought before him, upon the circuit at Lincoln, concerning the murder of one of the townsmen, who had been of the king's army, and was killed by a soldier of Cromwell's garrison there. The culprit was found guilty on the clearest evidence; and though colonel Whalley, who commanded the garrison, came into the court, and urged, that the man was killed only for disobeying the protector's order, and that the soldier was but doing his duty; yet the judge regarded both his hand and threatening in an attempt to obstruct justice; and therefore not only passed sentence upon the prisoner, but ordered the execution to be so immediate, that it might not be possible to procure a reprieve.

When Cromwell died, he not only excused himself from accepting the mourning that was sent him, but also refused the new commission offered him by his son John. It is said that he had acted under such an authority. He did not sit in Cromwell's second parliament in 1655; but in Richard's, which met in January 1657-8, he was one of the burgesses for the university of Oxford. In the healing parliament in 1660, which called Charles II. to the throne, he was elected one of the knights of the county of Gloucester; and moved that a committee might be appointed to look into the propositions that had been made, and the conclusions that had been offered by Charles I. during the late war, that thence such propositions might be digested as they should think fit to be sent over to the king at Breda. Charles II. soon after his restoration, recalled him in June, by writ, to the degree of serjeant at law: and, upon settling the courts in Westminster-hall, constituted him, in November following, chief baron of the court of the high baron of the commonwealth. When chancellor Clarendon delivered him his commission, he told him, that, "if the king could have found out an honester and fitter man for that important office, he would not have advanced him to it; and that he had therefore preferred him, because he knew none that suited it so well." He presided eleven years in that court, and very much raised its character, by his impartial administration of justice, as also by his generosity, diligence, and great impartiality in trials.

According to his rule of favouring and relieving those that were oppressed, he was very favourable to the non-conformists, and took care to shield them as much as possible from the severities of the law. He thought many of them had merited highly in the affair of the reformation, and at least deserved that the terms of conformity should not have been made stricter than they were before the war. It is universally acknowledged that no man was ever more delicate in avoiding every suspicion of being influenced in the decision of a cause. Being visited in his chamber by a nobleman of the first rank who had a suit in his court, he absolutely refused to hear from him any statement of the cause, saying that he never received information upon causes but in the open court, where both parties were to be heard alike. The nobleman, highly offended, complained to the king of the rudeness with which he had been treated; but Charles bade him be contented, saying, he verily believed that judge Hale would use himself no better, should he attempt to solicit him in a cause. He was of infinite service to the city of London after the great fire, by sitting in Clifford's-inn to assist in coining the plate, and removing the Temples, and satisfying the consciences, of the people, for the extirpation of prelacy, and satisfying the consciences of those who had a suit in his court, he absolutely refused to hear from him any statement of the cause, saying that he never received information upon causes but in the open court, where both parties were to be heard alike. The nobleman, highly offended, complained to the king of the rudeness with which he had been treated; but Charles bade him be contented, saying, he verily believed that judge Hale would use himself no better.
an active part in their proceedings; he was no doubt prevailed upon to assent, by the hope of moderating the passions, and fetting bounds to the extravagant projects, of the violent zealots. Whilft he entertained this hope, he would occasionally attend; but when he found his endeavours were unavailing, and the temper of the assembly would admit of no controul, he no longer shared with them in the responsibility for the wisdom or policy of their measures.

"Yet, notwithstanding this favourable view of the transaction, the warlike admirer of Hale must admit, that his subscription some time after to the Engagement, is a ground upon which his principles of attachment to a regal government may reasonably be questioned. Though Charles was no more, yet Hale was too enlightened and intelligent to conclude that there was an end of monarchy. The prince was alive, and unsubdued, who, it might be rationallly supposed, would make an effort to ascend his father's throne, and assert his legitimate rights. The tenor of this Engagement was a direct contradiction to the letter and spirit of the Covenant which he had taken. If then there be any meaning attached to words, and any sanction and value to the solemnity of an oath, by what train of reasoning can the conduct of Hale be justified? What else is implied in this engagement than a total renunciation of those principles upon which Charles was arraigned and condemned? What else than an unqualified rejection of the government, for which his country had approbation and indelible seal of fidelity to a parliament established without a king or house of lords? If oaths are things which men may allow themselves to take upon the ascendency of a party, and considered only binding so long as interest or violence shall prescribe, then indeed the conduct of Hale will admit of an easy and plausible defence, warranted by the admission of his character, and full conviction of his integrity, I feel myself at a loss for reasons to exculpate him in this instance from the charge of pusillanimity, selfishness, or versatility of principle. How much brighter would his character have shone, if he had followed the example of his learned friends, and with the same firmness returned the judge their answer! He would, indeed, have sacrificed his interest to his principles, but he would have displayed the virtues of suffering loyalty, and transmitted his name with unfilled lustre to an admiring posterity.

"Though it would betray in the biographer an unphilosophical regard to the excellence of human talents, and a repugnable partiality for Sir Matthew, to hold him up as an example of his kind; for his image of unpolluted innocence, and unerring rectitude; yet the uniform tenor and general complexion of Hale's character, his acknowledged reputation for learning, and conviction of his integrity, I feel myself at a loss for reasons to exculpate him in this instance from the charge of pusillanimity, selfishness, or versatility of principle. How much brighter would his character have shone, if he had followed the example of his learned friends, and with the same firmness returned the judge their answer! He would, indeed, have sacrificed his interest to his principles, but he would have displayed the virtues of suffering loyalty, and transmitted his name with unfilled lustre to an admiring posterity.

He would, indeed, have sacrificed his interest to his principles, but he would have displayed the virtues of suffering loyalty, and transmitted his name with unfilled lustre to an admiring posterity.

There is one circumstance recorded of him, which sufficiently proves indeed, that he had not been superior to the superstitious credulity of the times. It almost surpasses belief at the present day, with what reverence and horror our forefathers looked upon nature, before the world was enlightened by learning and philosophy, and how they loved to ascribe themselves with the appearances of witchcrafts, prodigies, charms, and enchantments. There was not a village in England that had not a ghost in it, the church-yards were all haunted, every large common had a circle of fairies belonging to it; and there was scarcely a shepherd who had not seen a spirit! The mind is overwhelmed in asomniference at the fact, that Sir Matthew Hale, the most pious, the most learned, enlightened, and virtuous of men, should, in the course of his bench, should declare his belief in witchcraft, at the assizes held March 10th, 1663, at St. Dunstan's, where he passed the sentence of death upon two old crazy wretches for that suppos'd crime, for which they were executed on the 17th of the same month. But before we venture to reproach his memory with extreme severity, we ought, in candour, to take into account the strong prejudices of the times in which he lived.

On thee moral works, too much praise cannot be bestowed. His style is admirably adapted to these important subjects. It is significant, peripetious, and manly; his words are spirit and life, and carry with them evidence and demonstration. These writings are indeed invaluable, as being a transcript of the soul of Hale himself. They furnish a lively and striking representation of his learning, wisdom, piety, and virtue, which shone in his life with such transcendent lustre, and raised him to the highest eminence. Hence it has been considered to be no small advantage to the cause of the Christian religion, that she has found, among her ablest and most zealous defenders, those who cannot be supposed to have espoused her interest but from a conviction of her truth.

"Whenever (says Mr. Thirlwall,) the deceit ventures to impute to the clergyman motives of selfishness, he is immediately exalted to the laws of the land, for which purpose I have pitched upon you; but if you won't let me govern by red gowns, I am resolved to govern by red coats!"

"It cannot be supposed that this illustrious judge was wholly exempt from the frailties of humanity;"
ous champions? His admirable fagacity, and strict impartiality in the search and discovery of truth, his care and diligence in confidering and examining the reafons and evidences of religion, all confpire to attach a pecular importance to his testimony, and enhance its value, to give an additional confirmation of the truth to the believer, and check the rash prefunption of the fceptic.

Men who might perufe with a prejudiced eye, the writings of thofe whose profefion immediately enjoins them to exert their abilities in the defence of the Gospel, may be prevailed on to pay them a ferial attention, merely by the authority of one, whose natural constitution, learned profefion, and worldly interest, raised him above fuspicion; by the refpeCt which the fame of his folid judgment and difcriminat ing powers muft command; and, above all, by the confiant ftrain of piety, virtue, and ufefulness, for which his life and literary labours were fo eminently diftinguifhed." Such was the abfiduous, the upright, the pious, the unaffuming, Sir Matthew Hale.

Haleelli, a town of Affic Turkey, in the province of Natolia: twenty-four miles south-west of Eregi.

Haleecus, f. in botany. See Croton.

Hale, f. He who pulls and hales.

Hale's (Alexander), a celebrated Englifh divine, who flourifted in the thirteenth century, born in Glotfcthshire. He was fent for education to the univerfity of Paris, where he didinguidted himfelf by his proficiency in theology and canon law. After taking his degree of bachelor of art, he commenced profefror in thofe sciences, and attracted a crowd of pupils, among whom were the future patrons of his life, John Eldham, afterwards king of France under the name of cardinal Bonaventure. In 1222 he embraced the monaftic flate among the Francifcans at Paris, with whom he fpent the remainder of his days, chiefly employed on the composition of various works. He died in 1245. The best of the writings which can with certainty be pronounced genuine, is the Summa univerfæ Teologiae, or Commentaries on the four Books of Sentences, which he undertook by order of Pope Inno cent IV. It was firft printed at Nuremberg in 1482, in folio, and afterwards at Basf in 1502, at Venice in 1575 and 1576, and at Cologne in 1622. As to the Commentaria in quatuor Libros Sententiarum, published under his name at Lyons, in 1515, in 4 vols. the bet critics concurred in maintaining that they are to be ascribed to fome other hand.

Hales (John), a learned Englifh critic, born at the city of Bath, in 1584. He was initiated in grammar learning in his native place, and at thirteen years of age he was qualified for the univerfity. He was entered a scholar of Corpus-Chrifti college, Oxford, where he attracted much notice by his extraordinary proficiency in literature, and the superior ability and acutenefs dif played in his academic exercises, when he took his degree of B.A. He was particularly famed for his accurate knowledge of the Greek language, which recommended him to the attention of the learned Sir Henry Sai vile, then warden of Merton college, through whole influence he was elected a fellow of that infitution, in 1605. Of his affifiance for Henry availed himfelf, as well as that of other able scholars, abroad and at home, in preparing for the prefs his fine edition of the works of St. Chrifoftom. Mr. Hales's skill in Greek like wise occasioned his being appointed Greek lecturer in his college, and, in 1612, profeffor of that language to the profefions at Eton college, ftyled the Golden Remains. In 1639, Mr. Hales was advanced to a canony of Windfor, and was infallated accordingly; but he did not enjoy this prefer ment any longer than till the commencement of the civil wars in 1642. About the beginning of the year 1645, he retired from his rooms in the college to private lodg ings at Eton, where he remained in clofe exclusion from fociety. He was permitted, however, to retain his fel lowhip for fome time, though he refused to fubcribe to the covenant; but upon his refufal to take the engagement, or oath, to be faithful to the commonwealth of England, as then elfablished, without a king or houfe of lords, he was ejected. From this time he underwent various fufferings and diftrefs in which Mr. Hales, a town of Brabant, situated on the Geefe: four miles south-east of Diel.

Haleendorp, a town of Germany, in the duchy of Holriftein: eleven miles eaf-east of Eutyn.

Hale's (Stephen), a celebrated divine and philofo pher, born in 1677, at Cranleigh, in Kent. He was the fifer son of Thomas Bodley, one or two femons, and his Tract on Schiffer, &c. About three years after his death, in 1659, there came out a collection of his works in quarto, with this title, Golden Remains of Mr. John Hales, of Eton College, printed by the "coer-nemorable," which was enlarged with additional pieces in a fecond edition in 1672. This collection consists of femons, miscellaneous, and letters written on particular occasions. In 1657 there appeared another collection of his works, in 8vo, entitled, Several Tracts, by the coer-nemorable Mr. John Hales. The firft complete collection of all his pieces was printed at Glasgow, in 1765, in 3 vols. 12mo.

Hales (William), a celebrated divine and philofo pher, born in 1677, at Cranleigh, in Kent. He was the sixth fon of Thomas Hales, efq. the eldefl fon of Sir Robert Hales, created a baronet by Charles II. and Mary the heiress of Richard Langley, of Abbots-Wood in Hertfordshire. In 1696 he was entered a penfioner at Bennet-college, Cambridge; was admitted a fellow of that college in 1703, and became bachelor of divinity in 1711. He foon discovered a genius for natural philofophy, and other scientific pursuits. Botany was his firft study; and he ufed frequently to make excursions among the Gogmagog hills, in company with Dr. Stukeley, with a view of procuting that enquiry. In company with this friend he also applied himfelf to the study of anatomy, and invented a curious method of obtaining a re prezentation of the lungs in lead. They next applied themfelves to the study of chemistry; in which, however, they did not make any remarkable progresse. In the study of astronomy Mr. Hales was equally abfiduous. Having made himfelf acquainted with the Newtonian fytem, he contrived a machine for displaing the phenomena of the heavens on much the fame principles with the Huyfens machine. On the fair death of his patron, called an Orrery.

About the year 1710 he was prefentted to the perpetual
tual cure of Teddington near Twickenham, in Middle-
f; and afterwards accepted the living of Porlock in
Somerfetshire, which vacated his fellowship in the college,
and which he changed for the tafety of the state in raising
him in Hampshire. Soon after, he married Mary, the
doughter and heir of Mr. Newce, who was rector of
Hallham in Sussex, but resided in Hertfordshire. On the
13th of March 1718, he was elected member of the
Royal Society; and on the 5th of March, in the year
following, he exhibited an account of some experiments
he had made on the effect of the fpirit of wine in raising
the sap in trees. This procured him the thanks of the
society, who also required him to prosecute the sub-
ject. With this request he complied with great plea-
Sure; and on the 14th of June 1725 exhibited a treatise
in which he gave an account of his progress. This trea-
tife being highly applauded by the society, he farther
enlarged and improved it; and in April 1727, publish-
ed it under the title of Vegetable Statics. This work
he dedicated to George II. who was then prince of
Wales; and he was the same year chosen one of the
lege, and which he exchanged for the living of Faring-
Somersetshire, which vacated his fellowfhip in the col-

Dr. Hales had now been several years honoured with the
effence and friendship of his royal highnesses Frederic
prince of Wales; who frequently visited him at
Teddington, from his neighbouring palace at Kew, and
took a pleasure in surprizing him in the midst of those
curious researches into the various parts of nature which
almost incessantly employed him. Upon the prince's
death, and the settlement of the household of the
prince-f owager, he was appointed clerk of the clofet
fervice of the king of Sweden, called
Copley's donation. The year following he pub-
lilhed a defcription of a Sea-gage, which he had in-
communicated to the late Colin Campbell, esq. who em-
municated to the public a description of a
method of conveying liquors into the
discovery of medicines for difolving the fone in the
urinary passages, and preserving meat in long voyages;
for which the king and Senate granted him a pri-

In 1743, Dr. Hales read before the Royal Society a de-
scription of a method of applying liquors into the abdo-
minal passages, for the cure of the several

diseafes of horned cattle. In the fame year he com-

dicated tar-water as an univerfal medicine: on this
account, particularly with refpeét to the ufe of tar-water in
the diſeafes of horned cattle. In the fame year he com-
municated to the public a decription of a
back-hoe, which will winnow and clean corn much sooner and better
than can be done by the common method. He also,
at the fame time, communicated to the public a cheap and easy way to preserve corn sweet in sacks; an inven-
tion of great benefit to farmers. He published also, but
without his name, a detection of the fallacious boafts
concerning the efficacy of the liquid them in difolving
the fone in the bladder. In 1748 he communicated to the
Royal Society a proposal for checking, in fome de-
gree, the progress of thefe rank corruptions by the pub-
lication of their defcriptions. This proposal was printed in their Transac-
sions. In the fame year he also communicated to the society
two memoirs, which were printed in their Transactions;
one on the great benefit of ventilators, and the other on
some experiments in electricity. In 1749 his ventilat-
ors were fixed in the Savoy priſon, by order of Henry
Fox, esq. then fecretary at war, afterwards lord Hol-
land; and the benefit was fo great, that though fifty or
a hundred in a year often died of the gaol-diftemper be-
fore, yet from the year 1749 to 1752 inclusive, no more
than four perfon s died, though in 1750 the number of
prifoners was 240; and of thefe four, one died of the
small-pox, and another of intermitten fever. In 1750 he
published a farther account on the caufes of earth-
quakes; occafioned by the flight Shocks felt that year
in London.

Dr. Hales had now been several years honoured with the
effence and friendship of his royal highnesses Frederic
prince of Wales; who frequently visited him at
Teddington, from his neighbouring palace at Kew, and
took a pleasure in surprizing him in the midst of those
curious researches into the various parts of nature which
almost incessantly employed him. Upon the prince's
death, and the settlement of the household of the
prince-f owager, he was appointed clerk of the clofet
fervice of the king of Sweden, called
Copley's donation. The year following he pub-
lilhed a defcription of a Sea-gage, which he had in-
communicated to the late Colin Campbell, esq. who em-
municated to the public a description of a
method of conveying liquors into the

educated at another. In 1734, when the health and
moral s of the lower clafs of people were Subverted by

On the death of sir Hans Sloane, which happened in
1718, Dr. Hales was elected a member of the Academy
of Sciences at Paris, in his room. The fame year he
published a decription of a sea-gage, which he had in-
vented to meafure unfathomable depths. The plan he
communicated to the late Colin Campbell, esq. who em-
ployed the ingenious Mr. Hawkibee to make the ma-
chine, which was tried in various depths, and anfwered
large quantities of freth air; a practice very Soon adopt-
d by the French navy. Mr. Croume's lecturer
college of phyficians to preach the annual Sermon called
Croume's lecture: which feron was published at the re-
quef of the college. In 1752, his ventilators were fixed in
Newgate, with branching trunks to twenty-four wards;
and it appeared that the disproportion of thofe that
died in the gaol before and after this eftablifhment, was
as fifteen to seven; a great eaxhief of the better men of
their fuccefs, and some obfervations on the great dan-
ger arifing from foul air, exemplified by a narrative of
feveral perfon s feizd with gaol-fever by working in
Newgate.

water, an account of which was published in the Philosophical Transactions.

His reputation and the interest of his family and friends might easily have procured him farther preferment; but of farther preferment he was not desirous; for being nominated by his late majesty to a canonry, he engaged the princess to request his majesty to recall his nomination; since he could not accept of any preferment which would reduce him to the dilemma either of neglecting his duty, or of foregoing his amusement in philosophical pursuits. He was, however, remarkable for social virtue and sweetness of temper; his life was not only blameless, but exemplary in a high degree; he was happy in himself, and beneficial to others; the constancy and regularity of his life, concurred, with a good constitution, to preserve him in health and vigour to the uncommon age of four-score and four years. He died at Teddington in 1761; and was buried, pursuant to his own directions, under the tower of the parish-church, which he built at his own expense not long before his death. Her royal highness the princess of Wales erected a monument to his memory in Westminster-abbey.

Halesia, f. [so named by Ellis, in honour of the learned and venerable Stephen Hales, D.D. F.R.S. the author of his celebrated work on the vegetables, in which he reduced them under different classes dodecandria, order monogynia, natural order of bicornes, (guascana, Joff.)] The generic characters are—Calyx: perianthium one-leafed, very small, superior, four-toothed, permanent. Corolla: monopetalous, bell-shaped, ventricose; mouth four-lobed, blunt, pubescent. Stamina: filaments twelve (fellowed sixteen), filiform, shorter than the corolla; anther oblong, blunt, upright. Pitillum: germ oblong, inferior; style filiform, longer than the corolla; stigma simple. Pericarpium: nut corticate, oblong, narrowing to both ends, four-cornered, the corners membranaceous, two-celled; (drupe four-celled, Gartner.) Seeds: foliary.—Essential Character. Calyx four-toothed, superior; corolla four-cleft; nut quadrangular, with two seeds. Species.

1. Halesia tetraptera, four-winged halesia, or snow-drop tree: leaves lanceolate-ovate, petioles glandular. This frequently comes up with two or three flakes, from fifteen to twenty feet high, sending out branches towards their tops. Leaves ferrate, hispanic, pointed, with the middle depressed, growing alternately. The flowers hang in small bunches along the branches, each gem producing from four to eight or nine; they are of a pure snowy white, and as they blow early in the spring, before the leaves appear, and continue for two or three weeks, they make a most elegant appearance. They are followed by pretty large four-winged fruit, hanging likewise in bunches, and very agreeable to the taste. The fruit is a juicy drupe, of an oblong obovate shape, four-sided, finishing at top in the style, at bottom in a very long peduncle: thin, finous and membranaceous, drawn out into four fliff lateral wings; shell bony, obvate, hispanic, pointed at each end, within empty, or having a furry finous substance in the middle, and four cells with a seed in each, inclosed all round in the periphery. The seeds are fixed to the bottom of the cells, and are oblong, a little bent, and of a pale colour. Native of South Carolina, growing commonly along the banks of the Stour, a branch of which rises in this parish; and the Stour is one of the most curious rivers in the world. It is much used in composition to signify a thing imperfect, as the following examples will show.

Halesowen, a market-town of Shropshire, on the north side of Stourbridge, 118 miles from London. It had formerly an abbey, built in 1215, of which great part of the walls are yet standing. It has market on Mondays; and two fairs, on the Monday after Easter Monday, and June 22. This parish is detached in a very curious manner from the rest of the county of Salop, being inclosed by Staffordshire and Worcestershire; some part of it being in the latter county, on the banks of the Stour, a branch of which rises in this parish; and the Stour is one of the most curious rivers in the world. It is much used in composition to signify a thing imperfect, as the following examples will show.

Half, f. plural haves, [hals, Sax. and all the Teutonic dialects. The f is often not sounded.] A moiety; one part of two; an equal part.—Half the misery of life might be extinguished, would men alleviate the general curse by mutual compulsion. Addison.

Well-chosen friendship, the most noble of all virtues, all our joys makes double. And into halves divides our trouble. Denham.

It sometimes has a plural significature when a number is divided:

Had the land selected of the best, Half had come hence, and let the world provide the rest. Dryden.

Half, adv. In part; equally:

I go with Love and Fortune, two blind guides, To lead my way; half loth, and half consenting. Dryden.

It is much used in composition to signify a thing imperfect, as the following examples will show.

HALF-BLOOD, f. One not born of the same father and mother.—Which shall be heir of the two male twins, who, by the doleful of the mother, were laid open to the world? Whether a filler by the half-blood shall inherit before a brother's daughter by the whole-blood? Locke.

HALF-
HALF-BLOODED, adj. Mean; degenerate.

The let alone lies not in your good will. —Nor in thine, lord.

HALF-BLOOD, is no impediment to descent of free, simple lands of the crown, or to dignities, or in descent of estates tail; but in other cases it is an impediment. A diminution is grantable to the half-blood of the deceased, as well as to the whole-blood; and half-blood shall come in for a share of an intestate's personal estate, equally with the whole-blood, they being next of kin in equal degree. Stat. 22 Car. II. c. 19. See the article DESCENT, vol. v. p. 755.

HALF-BLOODED, adj. Mean; degenerate.

Not in thine, lord. —No half-blooded fellow, yes.

Shakespeare.

HALF-BLOOM, / Among miners, a round pass of the face of a forest of iron work.

HALF-BOWL, f. An old British game, and one of those which were prohibited by Edward IV. It received its denomination from being played with one half of a sphere of wood. Half-bowl is practised to this day in Hertfordshire; where it is commonly called rokey-poky; and it is best performed upon the floor of a room, especially if it be smooth and level. There are fifteen small pins of a conical form required for this pastime; twelve of which are placed at equal distances upon the circumference of a circle of two feet and a half diameter; one of the three remaining pins occupies the centre; and the other two are placed without the circle at the back part of it, and parallel with the bowling-place, but so as to be in a line with the middle pin, forming a row of five pins, including two of those upon the circumference. In bowling, the bowl, when delivered, must pass above the pins, and round the end-pin, without the circle, before it beats any of them down; if not, the cast is forfeited: and, owing to the great beauty of the bowl, this task is not very readily performed by such as have not made themselves perfect by practice. The middle-pin is distinguished by four balls at the top; and, if thrown down, is reckoned for towards the game; the intermediate pin upon the circle, in the row of five, has three balls, and is reckoned for three; the first pin without the circle has two balls, and is counted for two; and the value of all the others singly is four one. Thirty-one chalke complete the game; which he who first obtains is the conqueror.

HALF-BRED, adj. Mongrel; half-bred; formed half like a horse.

HALF-BROTHEr, f. A brother by the father or mother's side.

HALF-CAP, f. Cap imperfectly put off, or faintly moved.

With certain half-caps, and cold moving nod,
They froze me into silence. Shakespeare.

HALF-CASTLE-BAY, a bay on the south coast of the island of St. Christopher: two miles west of Basseterre.

HALF-CROWN, f. A coin valued at two shillings and sixpence.

HALF-FACED, adj. Showing only part of the face; small-faced; in contempt:

Proud incroaching tyranny
Burns with revenging fire, whose hopeful colours
Advance a half-faced inn thriving to thine. Shakespeare.

HALF-FILe, f. The three foremost men of a battalion; the three hindmost men of a battalion.

HALF-GRUNEE-ISLAND, one of the smaller Shetland islands, in the North Sea: one mile and a half south from the island of Unf.

HALF-GUINEA, f. A gold coin valued at ten shillings and sixpence.

HALF-HATCHED, adj. Imperfectly hatched:

Here, thick as hailstones pour,
Turnips, and half-hatched eggs, mingled snow's,
Among the rabbit train.

HALF-HEARD, adj. Imperfectly heard; not heard to an end:

Not added years on years my talk could clothe:
Back to thy native islands might a thou, fail,
And leave half-heard the melancholy tale. Pope.

HALF-HORSE, f. Formed half like a horse:
Nor how the half-blooded people, Centaurs right,
Fought with the bloody Lapithae at bord. Spencer.

HALF-HYDE-BAY, a bay on the west coast of the island of Antigua: one mile and a half south of Red Point.

HALF-MARK, f. A noble, or fix shillings and eight pence in money. By our ancient law, if a writ of right is quashed, and the feisin of the plaintiff, or his ancestor, be alleged, the feisin is not irreclaimable by the defendant, but he must render the half-mark for the inquiry of the feisin; which is as much as to say, that though the defendant shall not be admitted to deny that the plaintiff or his ancestors were seised of the land in question, and to prove his denial; yet he may be allowed to tender half a mark in money, to have an inquiry made, whether the plaintiff, &c. were so seised, or not. Old Nat. Br. 26. But in a writ of advowson brought by the King, the defendant may be permitted to traverse the feisin, by licence, obtained from the King's serjeant; so that the defendant shall not be obliged to prove the half-mark. F. N. B. 31.

HALF-MOON, f. The moon in its appearance when at half increase or decrease. Any thing in figure of a half-moon:

See how in warlike murther they appear,
In thorns, and wedges, and half-months, and wings. Milton.

HALF-MOON, f. In fortification, an outwork having only two faces, forming together a right angle, whose gorge is in form of a crescent. See the article Fortification, vol. vii. p. 603.

HALF-MOON-BAY, a bay on the west coast of the island of Jamaica: two miles north of Orange Bay.

HALF-MOON-BAY, a bay on the north coast of the island of St. Christopher: two miles south-east of Richard Point.

HALF-MOON-FORT, a fort of the island of Barbadoes: one mile and a half north of Speight's Town.

HALF-MOON-KAY, a small island near the south coast of Jamaica: three miles south-east from Portland Point.

HALF-PENNY, f. plural half-pence. A copper coin, of which two make a penny:

He cheats for half-pence, and he doth his cost
To fare a farthing in a ferryboat. Dryden.

It has the force of an adjective conjoined with any thing of which it denotes the price. There shall yet be in England feven half-penny loaves sold for a penny. Shaksp.

HALF-PIKE, f. The small pike carried by officers:

The various ways of paying the salute with the half-pike. Tatler.

HALF-PINT, f. The fourth part of a quart:

One half-pint bottle serves them both to dine;
And is at once their vinegar and wine. Pope.

HALF-POUND, f. A weight of eight ounces; the half of a pound weight.

HALF-SEAL, f. A form used in the chancery, for sealing commissions to delegates, upon any appeal to the court of delegates, either in ecclesiastical or marine causes. Stat. 2 & Eliz. c. 5.

HALF-SCHOLAR, f. One imperfectly learned.—We have many half-scholars now-a-days, and there is much contention.
confusion and inconsistency in the notions and opinions
of some persons. Watts.
HALF-SEAS-OVER. A proverbial expression for
any far advanced. It is commonly used of one partly
intoxicated: Watts.
To make a double work of what's half finisht. Dryden.
length of the word.—I am a rogue, if I were not at
half-sight, part. adj. Fed with half a supper:
HALF-SUPT, adj. Half-bred; imperfect:
HALF-STRAINED, adj. Half-strain'd; imperfect:
I find I'm but a half-strain'd villain yet,
and mungrel-mischievous; for my blood boil'd
To view this brutal act. Dryden.
HALF-SUPT, part. adj. Fed with half a supper:
My half-sue words, that would have fed,
Please'd with this dainty bit thus goes to bed.
My half-sue words, that frankly would have fed,
Dryden.
HALF-SWORD, s. Close fight; within half the
length of the sword. I am a rogue, if I were not at half-
sword, with a dagon of two hours together. Falstaff.
HALF-TONGUE, s. The jury impannelled on the
trial of a foreigner, one half of which are to be Englisht
and the other half of that nation to which the criminal
belongs.
HALF-WAY, adv. In the middle:
Fearles he fees, who is with virtue crown'd,
The tempelt rage, and hears the thunder sound;
Ever the fame, let fortune smile or frown:
Serene as he liv'd renews his breath;
Meets deftiny half-way, nor shrinks at death. Granville.
HALF-WIT, s. A blockhead; a foolish fellow:
Half-wits are fleas, fo little and fo light,
We fearce could know they live, but that they bite.
Dryden.
HALF-WITTED, adj. Imperfectly furnished with
understanding. I would rather have trusted the refine-
ment of our language, as to fent, to the judgment of the
women, than of half-witted poets. Swift:
When half is added to any word noting personal qualities, it com-
monly implies contempt.
HALF-WORKER, s. Joint worker:
Is there no way for men to be, but women
Must be half-workers? Shakespeare.
HALFEN, adj. Wanting half its due qualities:
So perfect in that art was Paridel,
That he Malbecco's halfen eye did wide,
Yet did the wiled wonder well. Spenser.
HALFENDEAL, adv. Half.—And eveny lampe
were halfened videuent. Spenser.
HALF-HUL, a city of Palestine, belonging to the tribe
of Judah; situated in the mountains of that province,
John xv. 58.
HALI, a city of Palestine, belonging to the tribe of
Acher; situated on the boundary of that province.
John xvi. 75.
HALI-BEIGH, first dragoman or interpreter at the
Grand Signior's court at Constantinople, in the seven-
teenth century, born of Christian parents in Poland;
but, having been taken by the Tartars when he was
young, they fold him to the Turks, who brought him
up in their religion in the feraglio. His name, in his
native country was Bepokh. He learnt many languages;
and for Paul Ricaut owns he was indebted to him for
several things which he relates in his "Prefent State of
the Ottoman Empire." He held a great correspondence
with the English, who perfuaded him to tranflate some
books into the Turkish language; and he had a mind
to return into the bosom of the Christian church,
but died before he could accomplish the design. Dr. Hyde
published his book On the Liturgy of the Turks, their
Pilgrimages to Mecca, their Circumcision, and Wifting
of the Sick. He tranlated the catechism of the church
of England, and the Bible, into the Turkish language.
The manuscript is lodg'd in the library of Leyden.
He wrote likewise a Turkish grammar and dictionary.
HALIATU, the name of one of the Nereides.
Apollodorus.
HALICAMMON, a river which separates Thessaly
from Macedonia, and falls into the Sinus Thermiacus.
HALICARTUS, a town of Bocotia, founded by Hal-
hartus, the son of Thiberander. The monuments of Pand-
ion king of Athens, and of Lyfander the Lacedaemon-
nian general, were seen in that town. Lycy.
HALIBUT-HEAD, s. A fort of fish.—In the afternoon,
having three hours calm, our people caught upwards of
a hundred halibuts, some of which weighed a hundred
pounds, and none lefs than twenty pounds. Cook and
King's Voyages.
HALIBUT-HEAD, a lofty hill and island near the
west coast of North America, in the North Pacific Ocean,
discovered by captain Cook in 1774. Lat. 54. 27. N.
lon. 137. E. Greenwich.
HALICARAMBUM, s. in botany. See Cardio-
SPERMUM and PHYSALIS.
HALICARNAUS'SUS, a city of Caria, in Asia Minor,
and the residence of the kings of Caria; where Artemifi
erected the monument to her husband Maufolus: also
the birth-place of Herodatus, and Dionysius the his-
torician.
HALICCE, a city of the province of Se-
gefian: seventy-four leagues south-east of Zareng.
HALICOUS, a town of Asia Minor, in the prov-
ince of Nusia: twenty miles west of Kiangari.
HALICZ, or HALITSC, a town of Poland, and capi-
tal of a small country to which it gives name, in the
palatinate of Lemberg, which was formerly a kingdom,
fituated on the Dnieper. In 1325, the archiepiscopal
fee of Lemberg was translated hither; but, in 1416, it
was removed again to Lemberg.
HALIDON, s. That-hill am, Sax. holy judgment; or
half on, and done for lady. Our bleffed lady.
HALIEIS, in ancient geography, a town of Ar-
golis.
HALIEUTICS, s. [formed of aleué, Gr. fisherman,
which is derived from a, i.e.] Books treating of fislies:
as, the Halieutics of Oppian.
HALIFAX, an ancient, populous, and flourishing,
town, in the West Riding of the county of York, with
a capital market on Saturdays; and a fair on June 24,
for horses and cattle, and another on the 22d of October.
The town is seated on a branch of the Calder, rendered
navigable for barges to the Aire and Oufe navigations.
In its township and parish there are many rivulets fa-
nable to trade, affording innumerable (ituations for
mills, for the woollen and other manufactories. The
woollen manufactory has been long eftablifhed in this
parish, and appears to have been very peculiarly fostered
in early times, by having had the grant of a criminal
jurisdiction within itfelf, for the trial by jury, and exe-
cution by decollation, of fuch offenders as were found
 guilty of theft to the value of thirteen-pence half-penny.
This jurisdiction was granted to the town, over that part
of the parish called the Forth of Hardwicke, for the pur-
pofe of protecting the manufacturers' goods during the
night, whilst they were exposed on the racks or tenders
to dry. It appears from the history of this town, that
this jurisdiction was exercised so lately as the year two
two persons having at that time suffered under its au-
tority. This law, called the Halifax-law, was made in
the reign of Henry VII. If the fact was committed out
of the vicarage, but within the liberties of the forest of
Hardwicke, the offender was first carried before the ba-
liff, and if it happened that the clouds were met by the
frith
burghers of the several towns in the forest, by whom he
was either acquitted or condemned. If the latter, he
was carried within a week to the scaffold, and there be-
headed in a very singular manner, viz., by an axe drawn
up by a pulley to the top of a wooden engine, and faf-
tened by a piece of rope which was taken out in an
instant, and did its work. This engine they called
"maiden," the base of which still remains. The earl of
Morton, regent of Scotland, seeing one of these execu-
tions as he passed through Halifax, took a model of the
machine, and carried it into his own country; where, af-
after it having erected to terrify the people, his lord-
ship's head was the first that was cut off with it. This
ancient instrument is the modern GUILLOTINE of France;
which see described at p. 87, of this volume.

Though there were not above thirty houses in Halifax
in the year 1443, it was so populous in queen Elizabeth's
time, that they sent out 12,000 men to join her forces
againft the rebels; and fo industrious were they, that
notwithstanding the barren foil of the adjacent coun-
ty, they had then enriched themselves by the manufac-
tory of cloth. Since that, so great has been the demand
of kersey for clothing the troops abroad, that its trade has
been wonderfully increafed, especially as they have en-
tered largely into the manufactory of shalloons; so that
it has been calculated, that 100,000 pieces are made in
a year in this parifh alone, at the same time that almost
as many kerseys are made here as ever. It has been af-
firmed, that one house here has traded, by commiffion,
for 600,0001. a year, to Hamburg, in the single article
of kerseys. For the convenience of trade, the manufac-
turers have erected an elegant edifice, called the piece-
hall, or manufacturers hall. It is in the form of an oblong-
square, occupying ten thousand square yards, and con-
taining three hundred and fifteen definite rooms for the
lodgment of goods, which are open for sale once a-week
only, two hours on the market-day, from ten o'clock
till twelve. The form of this building is well adapted
to its ufe, and unites elegance, convenience, and fecu-
locity. The declivity of the ground, though not great,
yet forming a large space, obliged the architect to raife
half of the building three, the other only two, ho-
ries high; but the avenues to the rooms being by a cor-
ridor or piazza, fupported by columns or pillars of dif-
ferent orders round the interior part of the building,
the form of the building for greater elegance and per-
fay for the accommodation of visitors, a fpectator, placed in the centre of the area,
has a distant view of every room in the building, which
forms altogether a flirking coup d'ceil. The principal
manufactures of this parifh, besides kersey and shal-
loons, (of which considerable quantities are fent to Tur-
key and the Levant,) are tammies, duroys, callamancoes,
overlastings, ruffles, figured and flowered amens, dennis,
says, moreens, and flags; also, half-thickets, ferges,
honies, baizes, narrow and broad cloths, couplings, and
carpets. Here are also lately erected, many mills for the
cotton manufactory, which has been rapidly increafing.

To obstruct their courfe, till they come to the high chain
of hills, called Blackstone-edge, (the south-west boundary
of this parifh,) which not being able to furnish, the
greatest part in that cafe falls in Lancashire; at other
times it is forced over, when the electrical fire, with
the dregs of the dying-vat, and with the refeue of the
oil, the soap, the tallow, and other ingredients, ufed by
the clothiers in drefling and fcouring, the lands through
which
which it paffes, and which otherwife would be exceedingly barren, are enriched by it to a degree beyond im- 
agina- tion. Then, as every clother muft necessarily keep one or two cows, to fetch home his wool and his pro- 
visions from the market, to carry his yarn to the spin- 
ners, his manufacture to the fulling-mill, and, when fin- 
ished, to the market to be fold; fo every one gener- 
ally keeps a cow or two for his family. By this means, 
the small pieces of inclosed land about each house are 
occupied; and, by being thus fed, are full farther im- 
proved by their cattle. At borfe for corn, they feem to 
be enough to feed their poultry. They feed very few oxen 
or sheep; and, as this tract is full of large manufacturing 
towns on every fide, all employed in the clothing trade, 
they muft neccessarily have their provisions from more 
diftant parts. The confequence is plain: their corn 
comes up in great quantities out of Linclinshire and 
Northingham, and the East Riding of Yorkshire; the 
black cattle from theee, and from Lancashire; sheep 
and mutton from the adjacent counties every way; but- 
ter-from the East and North Ridings; and cheese out of 
Cheflire and Lancafhire. Hence the markets in this 
quarter are prodigiously thronged, particularly in the 
moll of Summer and October, that being the time 
when the clothiers buy up as many oxen as will ferve 
their family for the whole year, which they kill, salt, 
and hang up in the smoke to dry.

At village called Sowerby, is a confiderable river, 
formed from the little rills mentioned above, and the 
melted snows from Blackstone-edge; over which is a 
flite stone bridge of several arches; this river, which 
bears the name of the Calder, is navigable to Wakefield. 
South-end from Halifax is Kirkclee, formerly a nunnery, 
fitted on the Calder; near which is the monument of 
the famous Robin Hood; and, upon the moor, his 
Butts, two little halls fo called, about a quartet of a 
mile offender.

Still, it feems, has been the bounty of nature to this 
district, that two things effential to life, and more parti-
cularly to the buffines followed here, are found in it, 
and in fuch a fitation as is not to be met with in any 
part of England, if in the world, besides; we mean coal, 
and running water, on the tops of the highest hills. We 
doubt not but there are both springs and coal in the 
thefe halls; but, were they to fetch coals thence, it is 
probable the pits would be too full of water; it is much 
easier, however, to fetch them from the upper parts, 
the horses going light up, and coming down laden. This 
place, then, feems to have been deigned by Providence 
for the very purpofe to which it is allotted, for carry-
ing on a manufacture which can be fo easily fupplied in 
the county of its name, fettled by a number of Britifh 
digger, &c. See Nova Scotia.

HALIFAX, a county in the eastern part of British 
America, in the province of Nova Scotia. It contains 
Halifax, the capital, the townfhips of Londonderry, 
Truro, Onlowl, Colchefer, Lawrence, Southampton, 
Cana, and Timmouth. The inhabitants are chiefly 
Irith, Scotch, and New-Englanders. It has numerous 
bays and rivers; the chief of the latter are Shabben-
cadie, which is a boatable river, the Petvodiuc, Mem-
rance, &c. See Nova Scotia.

HALIFAX, the capital of the province of Nova Scotia, 
has been lately fixed on the South-side of the Har- 
life in 1749. It is situated on a fpacious and com-
dious bay or harbour, called Chebucto, of a bold and 
caly entrance, where a thoufand of the largest thips might 
ride with great convenience and safety. The town is built 
on the weft fide of the harbour, on the declivity of a 
commanding hill, whole summit is 256 feet perpendicular 
from the level of the fea. The town is laid out into 
quadrants and streets. The streets parallel and at right angles. 
The town and inburbis are about two miles in length; 
and the general width about a quartet of a mile. It con-
tained in 1793 about 1000 inhabitanrs and 700 houfes. 

At the northern extremity of the town, is the king's 
mall yard, completely built and supplied with flores of 
every kind for the royal navy. The harbour of Ha-
life is reckoned inferior to no place in British America 
for the feat of government, being open and acceffible at 
all feasons of the year, when almost all other harbours in 
thefe provinces are locked up with ice; alfo from its 
entrance, situation, and its proximity to the bay of Fundy, 
and principal interior fettlements of the province. This 
thoroughfbt, on the frontiers of Nova Scotia, has con-
communion with Pittot, fifty-eight miles to the north-
east on the Gulf of St. Lawrence, by a good road, finifhed 
in 1724. It is twelve miles northerly of Cape Sanbong, 
which
HALIFAX, a townhip of the American States, in Windham county, Vermont, twenty-three miles eainting of Aptonburgh, on the bay of Fundy, sixty-north-east of St. Ann, in New Bruns-
wick. Lat. 44. 40. N. lon. 63. 15. W.

HALIFAX, a township of the American States, in Windham county, Vermont, twenty-three miles eathing of South of Bennington; has Marlborough on the north, and the straight line south. It contains by the census 1309 inhabitants.

HALIFAX, a township of the American States, in Plymouth county, Massachusetts, situated thirty-five miles south-east of Boston. It was incorporated in 1734, and contains 664 inhabitants.

HALIFAX, a town and settlement of the American States, on the east side of Sichuan river, in Dauphin county, Pennsylvania, thirteen miles north of Har-
.

HALIFAX, one of the middle districts of the American States in North Carolina, bounded north by the State of Virginia, east by Edenton district, west by illil-
borugh, and south by Newbern. It is divided into seven counties, viz. Northampton, Halifax, Martin, Edgcomb, Warren, Franklin, and Nash, which contain 65,630 inhabitants. Besides smaller fountains, the Roan-
oke passes through this district in a south-east course, and the Pamlico has its source in it. Chief town, Halifax.

HALIFAX, a county of the above district, bounded north by North Carolina, east by South Carolina, west by Ber-
tie, and south by Warren. It contains 7453 inhabitants.

HALIFAX, the chief town of the above-mentioned county, and of the district of its name in North Caro-
.

HALIFAX, a county of the American States, in Vir-
ginia, bordering on the State of North Carolina: about forty-two miles long, and thirty-nine broad, and contain-
ing 14,732 inhabitants.

HALIFAX BAY, a bay on the north-east coast of New Holland. Lat. 18. 49. S.

HALIFAX BAY, a bay on the east coast of the island of Dominica. Lat. 13. 40. N. lon. 61. 20. W. Greenwich.

HALL, J. (Hail Tiss, Sax. and mef.) The feat of All-Gods;
She came adorned hither like fweet May;
Sent back like halms, or shortest day. Shakespeare.

HALIMUM, f. in botany. See SessuycM.

HALIMUS, f. in botany. See Atriplex and Por-
tula:Halicoidis.

HALIOGRAPHER, f. [from Gr. the fea, and halio, to write.] An hydrographer; one that treats on the nature of the sea.

HALIOGRAPHY, f. A description of the sea.

HALIOTIS, f. in helmintology, a genus belonging to the order of Ammonia; the characters of which are: shell uninive, dilated, ear-shaped, with a longitudinal row of sutures along the surface; fpire lateral, and nearly concealed. The shell is commonlly called the Sea Ear; and the animal contained in it is a limax. There are nineteen species now ascertained, viz:

1. Haliotis Midae: shell roundish, both sides polished; within the outer surface, the characters of which are: shell uninive, dilated, ear-shaped, with a longitudinal row of sutures along the surface; fpire lateral, and nearly

2. Haliotis tuberculata: shell subovate, the outside transversely grooved, rugged, and tuberculate; and is found in soft fells.

3. Haliotis firiata: shell ovate, ferruginous, transversely wrinkled and longitudinally firiata, or spotted with white, red, and green. Inhabits the seas of Africa and Barbary.

4. Haliotis variata: shell ovate, with longitudinal firiata, or the larger ones tuberculate; colour yellowish-brown or green. Inhabits the Indian Seas.

5. Haliotis marmorata: shell ovate, with fpheniform longitudinal firiata, or the larger ones tuberculate. Inhabits the Indian Seas.

6. Haliotis australis: shell oblong, with fcape margin, and elevated nerves on the outside. It is called the after.
7. Haliotis parva: shell ovate, red, with an elevated angle on the belly. Inhabits Africa and India.

8. Haliotis radula: shell ovate, greenish, spotted with brown, with elevated double transverse firiata. Inhabits Africa.

9. Haliotis aurata: shell varied with grey, blutus, and red; ovate, convex, cancellate; fpire prominent, infla-

10. Haliotis Guineae: shell ovate, subconvex, solid, with decrufate firiata, varied with green, red, and white. Inhabits the coaft of Guinea.

11. Haliotis imperforata: shell ovate, imperforate, with pricky ribs; fpire exerted. Inhabits India.

12. Haliotis pervera: shell ovate, imperforate, with the margin oblique above and below the tuberculate within; fpire con-
trary. Found hitherto only fiddle.

13. Haliotis plicata: shell transversely placed on the outside, the margin broad, thick, and very finely firiata longitudinally. Found fiddle near Hildefia.

14. Haliotis glabra: shell ovate, smooth, solid, varied with white and green; fpire placed low.

15. Haliotis Pulcherrima: shell roundish, varied with rosy and white, with granulate firiata; fpire exerted. Inhabits the South Sea Islands.

16. Haliotis virginea: shell ovate, with decrufate un-
dulate firiata, dull green, with whitish spots and bands; the under side shining with fine iridescent colours. In-
habits New Zealand.

17. Haliotis ovina: shell tubercular, depressed, wrinkled, varied with white, chesnut, and yellowish, with p AFFUS riorf in the middle; fpire open.

18. Haliotis gigantea: shell oval, roughened, varied with white and red, spotted, within margaritaceous; fpire de-
preated. Inhabits New Holland.

19. Haliotis iris: shell subovate, fulvus-brown, with transverse wrinkles and longitudinal tubercular plaits; the under side shining with changeable iridescent colours. In-
habits New Zealand. The shell is extremely rare and valuable. — See the article Conchology, vol. v. p. 21.

HALIRKHOTIUS, a son of Neptune and Euryte, who ravished Alcippe, daughter of Mars, because she fled from him. This violence offended Mars, and he killed the ravisher. Neptune cited Mars to appear at the tribunal of justice to answer for the murder of his son. The cause was tried at Athens, in a place which has been called from thence Areopagus: Age, Mars, and Cynos, village; and the murderer was ac-
quitted. Apollodorus.

HALITUS, adj. [halitus, Lat.] Vaporous; famous.

—We speak of the atmosphere as of a peculiar thin and halitus liquor, much lighter than fpirit of wine. Boyle.

HALSTEIN, or Hanstein, a town of the duchy of Guelderland: ten miles south-west of Harder-
wyck.

HALSTEIN, a town of the American States, in the State of New York, five miles south of Thurso.

HALSTEIN, or Hanstein, a town of Scotland, in the county of Caithness: five miles south of Thurso.
miles east-south-east of Haderfleben. Lat. 55° 12' N.
178 HAL

A manor-house, so called, because in it
were held courts for the tenants.—Captain Sentry, my
master's nephew, has taken possession of the hall-house,
and the whole estate. Addison.—The public room of a
corporation:

With expedition on the beadle call,
To summon all the company to the
court of justice; or, hall. Pope.

The large room of a house; the saloon.—That light we
see is burning in my hall. Shakespeare.

The term hall, or manor-house is very ancient in Eng¬
land. It is used by Spenser for chamber: She heard a wond'rous noife below the hall.
All sodainly the bed where she fhould be,
A false trap was let adowne to fall
Into a lower roome. Fairy Queen.

HALL, a town of Germany, in the archduchy of Austria; eight miles west-south-west of Steyer.

HALL (Hans), a learned English prelate, born in
1574, at Ashby-de-la-Zouch, in Leicestershire. After a
school education at Ashby, he was sent to Emanuel
college, Cambridge, of which he was chosen a scholar.
He obtained a fellowship of the same college, took the
degree of M. A. and during two years read the rhetoric
of Exeter. B. Jonson.

After a short stay there, bad health obliged him to return,
but not till he had preached a Latin sermon be¬
fore the synod, which testified its respect for him by
the present of a valuable gold medal. After refusing
the bishopric of Gloucester, he accepted, in 1627, that
of Exeter.

When the civil divisions in the state brought epif¬
copy into danger, he stood forth as its spirited de¬
fender from the prefs. His Remonftrance to the Parlia¬
ment in Behalf of the Liturgy and Episcopacy, was
thought important enough to merit a reply from a junto
of presbyterian ministers, under the fictitious name of
Smectymnuus. In 1644, Dr. Hall was translated to the
fee of Norwich. Joining with several of his brethren
in the famous protest of December 30, in that year,
against the validity of acts passed during their forced
abience, he was, with them, committed to the Tower.
In June 1642, he was released upon bail, and withdrew
to Norwich, where he remained till a fequestration
feized upon his effects. He removed from the palace
to Norwich, near which town he wrote a final eflate;
and died in September 1656, in the eighty-second
year of his age. Bishop Hall may rank among the Eng¬
lish poets, as being the first who gave a specimen of reg¬
gular faires in the language. His Virgiliationes con¬
tain s of six books, of which the firft three are called
toothless faires, their titles being moral and scho¬
latic; the laft three, biting faires. It is faid that
Pope, in conversation, exprefled a high opinion of their
merit. A new edition of them was printed at Oxford
in 1733. His other works confit of Meditations, Epif¬
tles, Sermons, Paraphraxes of the Scriptures, Contro¬
versial Treaties, &c. The collection of his works
amounts to five volumes, folio, and eight volumes, folio;
three were printed before his death. His moral pieces
were reprinted in a separate volume, folio, in 1758. A
beautiful little tract of his, entitled, Hecate, fue
Trat transformations de modo ambulantum cum Deo, was printed at Ox¬
ford in 1752.

HALL (John), a poet of distinguifed learning, born
at Durham, and educated at Cambridge, where he was
esteemed in his time the brighteft genius in that univer¬
sity. In 1645, when but nineteen years of age, he pub¬
lished his Hora Vaticana, or Essays; and the fame year
came out his Poems. He translated from the Greek,
Hierocles upon the Golden Verdes of Pythagoras;
before which is an account of the ingenious translator
and his works, by John Davies of Kidwelly. He died in
1656, aged twenty-nine.

HALLA, or Hella, a town of Asia, in the Arabian
Irak, situated on both fides the Euphrates, with a bridge
of communication, fuppofed to have been built on the
site of the ancient Babylon. It was formerly surround¬
ed by a wall, which is now defoyed; the gardens are
covered with fruit-trees, particularly palms, fo that the
town appears as if fittuated in a wood. It is fifty-five
miles south-west of Bagdad, and two hundred and
thirty-six north-west of Baffora.

HALLAGE, f. Toll paid for goods or merchandise
vended in a hall; and particularly applied to a fee or
toll due for cloth brought for fale to Blackwell-hall in
London. Lords of fairs or markets are entitled to this fee. 6 Rep. 62.

HALLAM, a township of the American States, in
York county, Pennsylvania.

HALLAMSHIRE, a certain part of the county of York, anciently called, in which the town of Sheff¬
field is situate. 6 Rep. 62.

HALLAND, a province of Sweden, bounded on the
north by Weft Gothland, on the eft by Smaland, on
the south by Skone, and on the west by the North Sea.
The country is in general mountainous, with confiderable
rable woods of oaks and birch-trees. The produce of corn is not sufficient for the inhabitants, but the rivers, which are considerable, abound in fish, especially in summer. The inhabitants carry on a profitable trade in cattle; their chief employ is grazing and fishing.

The principal towns are Laholm, Halmstad, Falkenberg, and Wardberg.

HALLENENBERG, a town of Germany, in the circle of the Lower Rhine, and duchy of Westphalia; seven miles north from London. It has a market on Thursdays; and fairs on Ascension-day, May 23, and June 13. The celebrated Roman folk-way, pales hence through the northwestern part of this country; but, when it enters Nottinghamshire, it inclines north-east through the vale of Belvoir, or, as it is commonly called, of Bever, to Newark.

All this long and ancient tract is still visible, though near 1500 years standing, through a rich and fertile country, having north-eastward the noble river Trent, for twenty miles together, often in view.

HALLE, a town of the Netherlands, in the county of Hainaut, situated on the river Senne; soon strongly fortified, but the fortifications were destroyed, with its gates, in 1577. This town was celebrated for a coffin image of the Virgin Mary, to which were made many pilgrimages: eight miles south-west of Brussels.

HALLE, a town of Germany in the circle of Lower Saxony, principal city of Magdeburg, situated on the Saale, and divided into four quarters. Here is a celebrated university, formed out of a military academy, and consecrated in 1626, where many of the nobility, and even princes, have been students. There are three Lutheran churches, with places of worship for Calvinists and Roman Catholics, and a synagogue for the Jews. The magistrates enjoy many privileges, and considerable possessions. The number of houses which pay taxes is about 10,000, the number of inhabitants is estimated at 14,000, exclusive of the students and garrison. Befides the common handicrafts of the town, there are several manufactures, as gloves, worsted and silk stockings, cloth, flannels, sattin, linen, china, flarch, ribbands, red and yellow Turkey leather, &c. The vale of Halle consists of the lowest part of the town, and lies on the Saale. In it are four rich salt springs, with numerous work-houses, where the water from the Saale is boiled, in order to make salt. Those for whose profit the salt is boiled are called panners, and must be freemen of the boiling trade, and be descendants of the Halle, who are descendants of the Wends, a people who in ancient times inhabited this country, and still retain their dress, language, and customs. It is to these salt-springs that the city of Halle owes its origin, but the particular time is not known. So early, however, as the beginning of the ninth century, it appears that there was such a place; and, in the year 965 or 966, the emperor Otho I. made a donation of it to the church at Magdeburg. By the emperor Otho II, also, it was enlarged, and endowed with a charter. In 1414, it was besieged by archbishop Gunther II. but not taken: it bought its safety at that time with a large sum of money. In 1435, it was again besieged, in vain, by Frederic elector of Saxony; but, in 1473, was taken by archbishop Ernef. In the sixteenth and seventeenth centuries, it frequently underwent the same fate; and, in 1725 and 1739, being surprized by the French and Austrians, suffered very severe exactions. The regency of the former archbishopric, now called the duchy of Magdeburg, reigned at this place till the year 1749, when its seat was removed to Magdeburg. It is fifty-six miles south of Magdeburg, and twenty-two north-west of Leipzig.

HALLE, a town of Germany, in the circle of Westphalia, and county of Ravenberg: six miles north-west of Bielefeld.
eminent teachers Duvernoi and Camerarius; and continued there for the space of two years, when the great reputation of the justly celebrated Boerhaave drew him to Leyden. Nor was this distinguished teacher the only man from whose superior abilities he had then an opportunity of profiting. Ruyfch was still alive, and Albinus was in full force; and there, from the superior abilities he had then an opportunity of profiting. Ruyfch was till alive, and Albinus, he spent all the day, and the greatest part of the night, in the most intense study; and the proficiency he made gained him universal esteem both from his teachers and fellow-students. From Holland, in 1727, he came to England. Here, however, his stay was but short, and it was rather his intention to visit the illustrious men of that period, than to prosecute his studies. He formed connections with some of the most eminent of them. He was honoured with the friendship of Douglas and Cheffelden; and he met with a reception proportioned to his merit from sir Hans Sloane, president of the Royal Society. After his visit to England, he went to France; and there, under those eminent masters, Winckel and Le Dran, with the latter of whom he resided during his stay in Paris, he had opportunities of prosecuting anatomy, which he had not before enjoyed. But the zeal of the young anatomist was greater than the prejudices of the people at that period, even in the enlightened city of Paris, could admit of. An information being lodged against him to the police for dissecting dead bodies, he was obliged to cut short his anatomical investigations by a precipitate retreat. Still, however, intent on the farther prosecution of his studies, he went to Bafi, where he first imbibed a taste for botany, and guided the mathematics under the celebrated Bernouilli.

This improved and instructed by the lectures of the most distinguished teachers of that period, he was removed to London, and here he was able to use his natural abilities, and by unremitting industry, he returned to the place of his nativity in the twenty-sixth year of his age. Not long after this, he offered himself a candidate, first for the office of physician to an hospital, and afterwards for a professorship. But neither the character which he had before he left his native country, nor the fame which he had acquired and supported while abroad, were sufficient to combat the interest opposed to him. He was disappointed in both; and it was even with difficulty that he obtained, in the following year, the appointment of keeper of a public library at Baser. The exercise of this office was indeed by no means suitable to his great abilities; but it was agreeable to him, as it afforded him an opportunity for extensive reading by which he has been so justly distinguished. The neglect of his merit which marked his first outlet, neither diminished his ardour for medical pursuits, nor detracted from his reputation either at home or abroad. He had the honour of being nominated a professor in the university of Göttingen, by our king George II. The duties of this important office he discharged, with no less reputation to himself than advantage to the public, for the space of seventeen years; and it afforded him an ample field for the exertion of those great talents which he possessed. Extensively acquainted with the sentiments of the physicians respecting the economy of the human body, brisk with the zeal of an experiment, he undertook the arduous task of exploring the phenomena of human nature from the original sources. In these pursuits he was no less indefatigable than successful, and there was hardly any function of the body on which his experiments did not reflect either a new or a stronger light. Nor was it long necessary for him, in this arduous undertaking, to labour alone. The example of the preceptor inspired his pupils with the spirit of indolent exertion. Zinn, Zimmermann, Calami, and many others, animated by a generous emulation, laboured with indefatigable industry to prosecute and perfect the discoveries of their great master. And the mutual exertion of the teacher and his students not only tended to forward the progress of medical science, but placed the philosophy of the human body on a more sure, and an almost entirely new, basis. But the labours of Dr. Haller, during his residence at Gottingen, were by no means unimportant in the science. He was not more anxious to be an improver himself, than to ingatigate others to similar pursuits. To him, the Anatomical Theatre, the School of Parturition, the Chirurgical Society, and the Royal Academy of Sciences at Gottingen, owe their origin. Such distinguished merit could not fail to meet with a warm andheart from the sovereign under whose protection he then taught. The king of England not only honoured him with every mark of attention which he himself could bestow, but procured him also letters of nobility from the emperor. On the death of Dilleniust, he had also an offer of the professorship of botany at Oxford; the states of Holland invited him to the chair of the younger Albinus; the king of Prussia was anxious that he should be the successor of Maupertuis at Berlin. Marshal Keith wrote to him in the name of his sovereign, offering him the chancellorship of the university of Halle, vacant by the death of the celebrated Wolf. Count Orlow invited him to Ruffia, in the name of his mistress the empress, offering him a distinguished place. Still, however, he was not satisfied with his advancement in rank, nor did he detract from his reputation either at home or abroad. He had the honour of being nominated first professor, as well as the greatest promoter, of the learned society of the Orphan Hospital of that city. Declining health, however, restrained his exertions in the more active scenes of life; and for many years he was confined entirely to his own house. Even this, however, could not put a period to his utility: for, with indefatigable industry, he continued his favourite employment of writing till within a few days of his death. The 70th year of his age, on the 12th of December, 1777.

The writings of baron Haller deservedly rank high in the annals of literature. In 1742 appeared the first edition of his great work on the botany of Swifferland, entitled, Enumeratio Plantarum indigenarum Helvetae, folio; which at one raised him to the first class among the physicians in that science. It received several successive corrections and augmentations in separate publications; and at length, in 1768, was given in its perfect form, under the title of, Historia Stirpium Helvetiae indigenarum, 2 том. in 2 vols. folio, with many plates. He also gave a catalogue of the plants growing in the botanical garden, and in the district of Gottingen, in 1742, and 1755 8vo. and he published a number of botanical papers, which
HAL'LER (Gottlieb Emanuel), son of the preceding, born at Nyon in the canton of Berne, in 1735, and died at Berne in 1786, in the fifty-first year of his age. He distinguished himself by an extensive history of his native country. On this laborious work he was employed for thirty years, and when published, he had been gifted with great modesty for not having been able to produce any thing better. It appeared under the title of, Bibliothek der Schweizer-Geschichte, &c.--Library of the History of Switzerland, and of every Thing relating to it, systematically arranged and in chronological Order, Berne, 1785-1787, 6 vols. large 8vo. A general index prefixed. This work is here considered a lauding monument of the author's industry as well as accuracy, and may be of great use to the future historian.

Haller was also author of a work on numismatics entitled, Schweizersches Münz und Medaillten Cabinet—Catalog of Swiss Coins and Medals, published at Berne in 1780 and 1781, in 2 parts, 8vo, with plates. He had a share in the Encyclopädie of Yverdon, in the Dictionnaire de la Suisse, and the Acta Helvetica.

HAL'L'R'IA, f. [so named by Linnaeus, from the famous Albert Haller, author of Stirpes Helvetiae, &c.] In botany, a genus of the class didynamia, order angiospermae, natural order of fpermatifae, (fchrophulariae, &c.) Its generic characters are—Calyx: perianthium one-leaved, trifid, flat, spreading, very obtuse; the upper cleft twice as broad as the rest. Corolla: monopetalous, ringent: tube roundish at the base, bent in with a swelling throat: border oblique, upright, four-cleft; the upper cleft a little longer than the others, blunt, emarginate; the side ones shorter, broader, harper; the lowest very short, very slender, and very sharp. Staminodium: filaments four, bristle-shaped, straight, inserted into the tube, longer than the corolla; antheres roundish, twin. Pistillum: germ inferior, ovate, ending in a style longer than the staminodia: stigma simple. Pericarpium: berry roundish, two-celled. Seeds: small, flat, roundish, winged.—Essential Character. Calyx, trifid; corolla, quadrifid; filaments longer than the corolla; berry inferior, two-celled.

Halleria lucida, or African fly-honeysuckle: a single species. This plant grows to the height of six or eight feet, with a woody stem well furnished with branches. Leaves-ovate, serrate, opposite, and continuing green through the year; the flowers come out singly, and are of a red colour; but, being intermixed with the leaves, they are not easily discerned. They come out in June, and the seeds ripen in September. The leaves continuing green all the winter, this plant makes a good variety in the greenhouse during that season. It is a native of the Cape of Good Hope; flowers from June to August; and may be propagated by cuttings, which, if planted in pots filled with light earth in June, will soon take root. The plants may be exposed in summer, and will require plenty of water at that season: in winter they must be housed with myrtles, and other hardy exotic plants, which require much air in mild weather.

HAL'LET (Joseph), a learned English nonconformist divine, born at Exeter, in 1692. He was admitted to the ministry in 1723; and in 1732, after being ordained at Exeter, settled as pastor with a small congregation at Shobrook. In 1772, he was invited to succeed his father as co-pastor with Mr. Peirce, to a congregation of protestant dissenters in Exeter. In 1779 Mr. Hallet published, The free and impartial Study of the Holy Scriptures recommended; being Notes on some peculiar Texts; with Discourses and Observations, &c.
HAL

182

In 1736 he published a treatise entitled, The Truth and Importance of the Scripture Doctrine of the Trinity and Incarnation demonstrated; and when, in the year 1737, Dr. Morgan commenced his injudicious attack upon revealed religion, the Confident Christian, he died in 1744, when about fifty-two years of age. That he professed a very considerable share of learning, combined with great critical sagacity, is abundantly proved by his publications, and particularly by his three volumes of Notes and Discourses, which are deservedly held in high estimation by biblical students. As a minister he discharged the duties of his profession with exemplary diligence and fidelity; and in private life, he secured the esteem of all who knew him, by his mildness and gentleness of his temper, and his truly Christian behaviour.

HALLEY (Edmund), an eminent English mathematician, born in the parish of St. Leonard, London, in 1656. He was early placed at St. Paul's school, under the care of Dr. G. le ; where he not only distinguished himself by his proficiency in classical learning, but made considerable advances in mathematical knowledge. In 1673, he was entered a commoner of Queen's-college, Oxford, where he applied himself chiefly to mathematics and astronomy. Of his skill in astronomy he gave a singular proof when he was only nineteen years of age, by communicating to the world his Direct and Geometrical Method of finding the Aphelia and Excentricities of the Planets. He likewise distinguished himself by the improvement which he made in other parts of astronomy. Besides the above observations on an angular proof when lie was only nineteen years of age, lie secured the esteem of all who knew him, by the strongly expressed satisfaction with Mr. Halley's exertions, and at his request, granted him a letter of mandamus to the university of Oxford, for the degree of M. A. which was dated November 18, 1678; and in the same month he was elected a fellow of the Royal Society.

In 1679, he published his catalogue, under the title of, Catalogus Stellarum Australium, sive Supplementum Catalogi Tycho- nici, exhibens Longitudines & Latitudines Stellarum fixarum, quae prope Polum antarcticum sit in Horizonte Uranaburgico Tycho- nici Colleque Surinami, seu, Exemplaria... Lucullus, etc. publidunt aforismatici Notam non ignominiae. The articles in the Appendix consist of an account of the transit of Mercury over the sun's disc in 1677, with methods for finding the solar and lunar parallaxes, and observations useful for correcting the theory of the moon. This work was scarcely published, when Mr. Halley was fixed upon as a situation proper for the accomplishment of his design. He embarked for that island in November 1676, when he was only twenty years of age, and arrived there after a voyage of three months. He applied with unconcealed diligence to the use of his telescopes till he had finished the task which he had undertaken, and entirely completed his catalogue. Upon his return to England, in November 1678, after an absence of two years, he delineated a planisphere, in which he accurately laid down the exact places of all the stars near the south pole, from his own observations. The king expressed himself greatly satisfied with Mr. Halley's exertions, and, at his request, granted him a letter of mandamus to the university of Oxford, for the degree of M. A. which was dated November 18, 1678; and in the same month he was elected a fellow of the Royal Society.

HALLET'S FORT, a fort of the island of Barbados: one mile and a quarter north-north-west of Bridgetown.

Although he had been required by the publication of The Mo-
alterate proportion; when, after some meditation, he concluded from it, that the centripetal force must decrease in proportion to the squares of the distances reciprocally. Finding himself, however, unable to make this out in any geometrical manner, he determined to try it upon a practical head, and, after sailing the seas, he went to Cambridge, to consult Mr. Newton, who supplied him fully with the calculations which he wanted. In the course of his conversations with that great man, he found that he possessed and immense treasure of astronomical learning, and would not rest till he had made the most of it. In the course of the next year, 1686, he proceeded thence to St. Petersburg, with the intention of carrying the emperor's design into execution; but, owing to some opposition from the Dutch, it was for some time laid aside, and he returned to Vienna. Being introduced to the emperor, he gave him an account of two harbingers of his plan, which were for many years the chief ornament and support. Their various merit is thrown into one view by M. Mairan, the writer of his Éloge in the Paris Memoirs, who, having mentioned his Histoire of the Trade-winds and Monsoons, proceeds in these terms: “This was immediately followed by his estimation of the quantity of vapours which the sun raises from the sea; the circulation of vapours; the origin of fountains; questions on the nature of light, and transparent bodies; a determination of the degrees of mortality, in order to adjust the valuation of annuities on lives; and many other works, in almost all sciences; astronomy, geometry, and algebra; optics and dioptrics; ballistics, and artillery; speculative and experimental philosophy; natural history, antiquities, philology, and criticism: being about twenty-five or thirty dissertations, which he produced during the ten years of his residence at London; and all abounding with ideas new, singular, and useful.”

In 1692, Mr. Halley resigned his appointment of assistant secretary to the Royal Society, and in 1695, upon the establishment of five different mints, for the recoinage of the silver specie, he was constituted comptroller of the office at Chester. This employment occasioned his residence in that city for two years; during which time he diligently pursued his philosophical investigations, accounts of which were regularly transmitted to the Royal Society, and published in their Transactions. In 1698, king William appointed him commander of the Paramour pink, with orders to search out by observations, and lay down, the longitudes and latitudes of the English settlements in America, &c. On this attempt he fell sick in November 1698; but after he had crossed the line, his men growing sickly and untractable, and his first lieutenant mutinying, he returned home in June 1699. Having got the lieutenant tried and cashiered, in the month of September following, he set sail a second time, in the same ship, accompanied with another of smaller size, which was also placed under his command. With these ships he traversed the Atlantic ocean, from one hemisphere to the other, till the ice in the frozen regions of the south obstructed his navigation; and on his voyage home he touched at St. Helena, the coast of Brazil, Barbadoes, Cape Verde, Madeira, the Canaries, the coast of Barbary, and many other latitudes. He arrived in England in September 1700, furnished with a competent number of observations; and a few years after published a work, entitled A Voyage to one View the Variation of the Compass in all those Seas where the English Navigators were acquainted. By this invaluable work he laid the foundation for the discovery of the law by which the variation changes in all parts of the world. Captain Halley, as he was now called, had been at home little more than half a year, when he received a commission from the king to observe the course of the tides, with the longitude and latitude, of the principal head-lands in the British Channel, which he executed with his usual accuracy, and soon after his return published a large chart of the British Channel.

In 1702, the emperor of Germany, resolving to make a safer and convenient harbour for shipping in the Austrian territories on the Adriatic, captain Halley was sent by queen Anne to take a survey of the ports in Dalmatia. After passing through Holland and Germany to Vienna, he proceeded thence to Istria, with the intention of carrying the emperor's design into execution; but, owing to some opposition from the Dutch, it was for some time laid aside, and he returned to Vienna. Being introduced to the emperor, he gave him an account of two harbours on the Istrian coast, and was presented by his majesty...
jeft of completing the theory of the moon's motion. To this design he devoted his utmost affability; and, although he was in the sixty-fourth year of his age when he entered upon his office at Greenwich, yet for the space of eighteen years he watched the heavens with the closest attention, scarcely missing a meridian view of the moon during all that time, when the weather was not unfavourable, and performing the whole business of the observatory without any assistant.

Upon the accession of George II. his consort, queen Caroline, who took pleasure in patronizing men of talents, paid a visit to the royal observatory; and, being gratified with the reception which she met with, took notice that Dr. Halley had formerly served the crown as a captain in the navy. Soon after this visit she obtained for him a grant of his half-pay for that commission, which he enjoyed during the remainder of his life. He was also offered the appointment of mathematical preceptor to the duke of Cumberland; but he declined the acceptance of it, both on account of his advanced age, and because the necessary attendance upon that employment would interfere too much with his duty at Greenwich. In August, 1729, he was admitted a foreign member of the Academy of Sciences at Paris. He had enjoyed an uninterrupted state of health from his mid-twenties, and continued under the same circumstances till the year 1737, when a paralytic attack on his right hand evinced the decay of his constitution. He died in his chair, without a groan, on the 4th of January, 1741-2, in the eighty-sixth year of his age. Dr. Halley was naturally of an ardent and glowing temper, of a generous and friendly disposition, open and frank in all his transactions, cautious in his judgment, uniform and blameless in his manners, of an amiable affability, always communicative, and totally disinterested. He lived and died in that mediocrity so much extolled by the best philosophers; the free choice of which implies a great degree both of wisdom and of virtue. His great qualifications were tempered with a vein of vanity and good humour, which neither his abstracted speculations, the infirmities of old age, nor the palsy itself, were able to impair. And, together with this happy cheerfulness of temper, his memory and judgment were preferred to the laft. Besides the articles noticed above, he was the author of 1. Tabula Astronomica, &c. which was published after his death, in 1753, in the first volume of this title. A Synopsis of the Astronomy of Comets, annexed to the second volume of Mr. Gregory's Elements of Astronomy; and a vast multitude of papers in the Philosophical Transactions, vol. xi. to vol. lx. 5. Hallia lemmoni, a genus of the class diadelphous, order decandria. Essential generic characters—Calyx five-parted, regular; legume one-seeded, two-valved.

Species.

1. Hallia alata: leaves oblong, glabrous; stipules deciduous; stem winged. 2. Hallia scilla: leaves lanceolate, mucronate, glabrous; peduncles one-flowered, as long as the leaves. 3. Hallia fororia: leaves lanceolate, mucronate, glabrous; peduncles one-flowered, shorter than the leaves. 4. Hallia cordata: leaves hearted, oblong, acute, glabrous; peduncles one-flowered, as long as the leaves. 5. Hallia alata: leaves oblong, acute, pubescent; peduncles one-flowered, as long as the leaves. 6. Hallia hirta: leaves hearted, roundish, ciliate; flowers nearly sessile; stem without stipules. Leaves with pellucid dots; flowers yellow. Inhabits Tranquebar. 7. Hallia imbri cata: leaves hearted-ovate, convolute, imbricate: flowers axillary, sessile. Leaves ciliate on the margin and midrib. Inhabits the Cape. 8. Hallia fororia: leaves roundish kidney-form, emarginate,
Halliard, a learned French prelate, born at Chesterfield, in Derbyshire, in 1730. After passing through a common school, he was sent for academic education to Jesus college, in Cambridge, where he proceeded B.A. in 1745, and M.A. in 1747. Afterwards he removed to Trinity-hall, where there are only two fellowships in divinity; which was probably the motive for his proceeding doctor of laws, in 1765.

For many years he held the professorship of Arabic at Cambridge, which he resigned in the sixtieth year of his age, being appointed regius-professor of civil law in the university. In the service of his professorship, he acquired considerable celebrity by a public course of lectures which he delivered, of which the heads were published by him, under the title of, An Analysis of the Civil Laws, containing a particular comparison between the Roman laws and those of England. In 1775 the degree of doctor of divinity was conferred upon him, by royal mandate. He next created chaplain in ordinary to his majesty; appointed master of the faculties in doctors' commons; presented to the valuable rectory of Workop, in Nottinghamshire; and elected master of Jesus college, in which he had been educated. In 1781 he was advanced to the see of Gloucester; whence he was translated to that of St. Asaph, in 1797. He died in 1805, just as he had completed his sixty-seventh year. Besides several single sermons, he published, 1. Three Sermons preached before the University of Cambridge, on the attempt to abolish subscriptions in 1772. 2. Twelve Sermons on the Prophecies concerning the Christian Church, and in particular concerning the Church of Rome, preached in Dr. Willis's sermon on the Arbortonian lecture in Lincoln's-inn-plant, 1777, 8vo. 3. An Analysis of Bishop Butler's Analysis of Religion natural and revealed, annexed to a charge of that prelate; and a vindicatory preface to Dr. Ogden's Sermons, of which he was the editor.

Halling, a lake of Norway, sixty-four miles north-west of Christiania.

Hallingdal, a river of Norway, which runs into the bay of Christiania, near Holmebrand, in the province of Agderhus.

Halling, a learned French prelate, born at Chartres in 1595; but, owing to a derangement in his state of health permitted him to retain only one year. In 1644 he published, The Moral Theology of the Jesuits, which involved him in a bitter controversy between them and the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the primate of this see, and of the theological faculty at Paris, who, in 1646, with the approbation of the cardinal of Fleury, the prime
of public resort; that we invest God himself with them, and that we ferv them from common ufe. Hooker.

God from work

Now refing, blefs'd and hallow'd the seventh day. Milton.

To reverence as holy.—Hallowed by thy name. Lord's Prayer.

HALLOWELL, a flourishing poll-town of the American States, in the diftrict of Maine, and the fhire-town of Lincoln county, diftated in lat. 44° 15'. N. at the head of the tide-waters on the west fide of Kennebec river. An academy is eftablisht here with a confiderable fund for education. There are three miles north of Bamberg.

HALLOW, in surgery, to give the life to the flour, cattle, &c. Thefire of lamp oil is fermented, and their new fermentation is called hallow.

HALLOWELL, a town of Georgia, in the archduchy of Austria, fix miles fouth of Gemunden.

HALLOWED, by the late and reverend bishop of Bamberg, in his charge of the feventh day.

HALLOWEEN, a popular and peccadillous holiday celebrated in feveral parts of England, and accompanied with extravagant and liberally drunken refemblances. It is celebrated by the refemblances of the difcourfed pagans, at the end of October, the time of their own ancient Saturnalia, and, we may fay, the time of the free refemblance of thefefeftivitie.

An academy is eftablisht here with a confiderable fund to give the life to the flour, cattle, and fhe cement, fermed, and their new fermentation is called hallow.

HALLOWEEN, the lord of the yeveft fide of Kennebec river.

HALLOWEEN, the lord of the yeveft fide of Kennebec river.

HALLOWEEN, a popular and peccadillous holiday celebrated in feveral parts of England, and accompanied with extravagant and liberally drunken refemblances. It is celebrated by the refemblances of the difcourved pagans, at the end of October, the time of their own ancient Saturnalia, and, we may fay, the time of the free refemblance of thefefeftivitie.

HALLOWEEN, the lord of the yeveft fide of Kennebec river.

HALLOWEEN, a popular and peccadillous holiday celebrated in feveral parts of England, and accompanied with extravagant and liberally drunken refemblances. It is celebrated by the refemblances of the difcourved pagans, at the end of October, the time of their own ancient Saturnalia, and, we may fay, the time of the free refemblance of thefefeftivitie.
green, yellowish, red; violet, green, yellowish, red.
The red of a fourth was just visible. The radii of the rings being, in each case, to be conspicuous to the violet in the next. On the 2d of December following, he observed a single halo round the moon, at about a degree and a quarter from it; the colours followed one another in the same order that they were mentioned above; and the red colour of a second halo was just discernible, the diameter of which, as nearly as could be determined by the eye, was double the diameter of the inner one. Mr. Wood noticed, that the order in which the colours were situated, as well in these as in all the halos which he has seen, is similar to the order alligned to them by Sir Isaac Newton at the end of the second book of his Optics; and, consequently, contrary to the order in which they are laid down by Des Cartes and Huygens: but he thinks the hypothesis by which Newton attempted to account for the appearance of theses meteors, is equally unsatisfactory with those with which the two latter gentlemen had employed for the same purpose.

There are several artificial ways of exhibiting phenomena of this kind: the flame of a candle, placed in the mouth of a glass receiver, when air is admitted into the vacuum within it to a certain density, in each of these cases, or their branches, pencilled, upright. Stalk quadrangular, and red; the angles elevated, rounded, scabrous. Leaves opposite, petioled, horizontal, ovate-lanceolate, unequally cleft, with the serratures prickly; e.brous, flat, vened, with an inch in length; pedicles one-third of the length of the leaves, fuscicord, channelled. Flowers at the ends of the branches, axillary, in threes, pencilled, small, reddish green. It was found abundantly in New Zealand by Mr Joseph Banks, bart. and others. The younger Linnaeus informs us that it flowered with him in November 1779; and that some of the flowers had petals, others none. With us it flowers most part of the summer, and was introduced in 1772.

HALOSACHNE, f. [from aλς, Gr. the sea, and αυρα, froth.] The froth or fpane of the sea.

HAL'PACH, a river of Germany, in the archduchy of Austria, which runs into the Tisul about two miles further as the crow flies. As it breaks and disperses into drops, forms a kind of halo or iris, exhibiting the colours of the natural rainbow. Muhlenbock observed, that when the glass windows of his room were covered with a thick plate of ice on the inside, the moon seen through the interstices, into its separate particles, appeared surrounded with a large and variously-coloured halo; which, upon opening the window, he found arose entirely from that thick plate of ice, because none was seen except through such plate. Muhlenbock concludes his account of coronas with observing, that some density of vapour, or some thickness of the plates of ice, divides the light in its transmission either through the small globules or their interfaces, into its separate colors, by the same means that density of vapour, or what the particles which compose the vapour, he does not pretend to determine.

HAL'PACH, a river of Germany, in the circle of Bavaria, and the province of Tabasco.

HAL'S, a town of Germany, in the province of Drontheim: sixty miles southwest of Drontheim.

HAL'SEING, adj. [hals, Germ. halo, Scottifh, the neck.] Sounding harshly; inharmonious in the throat or tongue. Not in use.—This half-hoarse noisy name hath, as Cornuto in Italy, opened a gap to the scoffs of many.

HAL'SER, [from hal], Sax. a neck, and peal, a rope. It is now in marine pronunciation corrupted to hauper. A rope less than a cable: A beechen mast then in the hollow base They hoisted, and with well-wreath'd halfers hoist Their white fails.

HAL'SINGLAND, a province of Sweden. See Hel-singland.

HAL'PARED, a heat and pleasant market-town in the county of Essex, situated forty-seven miles from London, fourteen from Colchester, eight from Sudbury, and twenty-four from Cambridge. It is seated on a rising ground, at the foot of which the river Colne pales through. It is esteemed a healthy situation, on account of the breadth and airiness of the streets. The general trade is the manufacturing of bays and faws, the annual value of which has been very considerable; but for some years past it has been in a declining state, as is the case of the neighbouring towns. It has two fairs in the year, for horse, cattle, and toys, on the 6th of May and 29th of October. Market on Fridays. Here is a good grammar-school, founded by Dame Mary Ramfey, widow, in 1594, for forty free scholars: the trustees are the governors of Driff's hospital, in London. Here was also a collegiate church for eight pastors. The principal seat in the neighbourhood is that of the marquis of Buckingham.

To HALT, v. i. [halt, Sax. lane, head, and lym.] To lisp; to be lame: Spener himself affects the obsolete, and Sidney's verse halts ill on Roman feet.

To step in a march.—I was forced to halt in this perpendicular march.
bious.—How long halt ye between two opinions? 1 Kings.—To fail; to flatter.—All my famillars watched for my halting, saying, Peradventure he will be enticed, and we shall prevail again him. Jeremiah.

HALT, f. Lame; crippled.—Bring in the poor, the maimed, the halt, and the blind. Luke.

HALT, f. The act of limping; the manner of limping. [Acts, Fr.] A hop in a march.—Without any halt they marched between the two armies. Coriolanus.

The heavily bands
Down from a sky of Jasper lighted now
In Paradise, and on a hill made halt.

Milton.

HALTER, f. [from halt.] He who limps.

HALTER, f. [hale, Sax. from half, the neck.] The rope or trace which secures a horse to the manger. A rope to hang malefactors:

He's red, my lord, and all his pow'rs do yield;
And humbly thus, with halter on their necks,
Expect your highness' doom of life or death. Shakespeare.

A cord; a strong string.—Whom neither halter binds nor burthens charge. Sandy.

To HALTER, v. a. To bind with a cord; to catch in a noose.—He might have employed his time in the frivolous delights of catching mole's and haltering frogs. Afterbury.

HALTERCAST, adj. Thrown down by means of an entanglement of the halter.

HALTERCAST, f. In farriery, an excoriation of the pattern, occasioned by the entanglement of the halter.

HALTEREN, a town of Germany, in the circle of Wetzphalia, and bishopric of Munffer, situated on the Lippe: twenty miles south-west of Munffer. Lat. 51. 43 N. lon. 11. 40 E. Ferro.

HALTERING, f. Binding with a halter.

HALTERISTE, f. In Grecian antiquity, were those who at the games exercised themselves in vaulting or leaping; which was performed sometimes with the hands empty; sometimes with weights of lead, either in their hands, or on their heads and shoulders. These were called arope; which were maffes of lead or foam, which they held in their hands; and which they threw into the air to augment the elacticity of the body in leaping; whence they have, by some writers, been erro-

neneously denominated quilt-players, because they threw these leaden weights into the air, in a familiar manner to the discus. The place from which they leaped was called arospina; a ditch, or spinae, to dig. Hence arose the proverbial expression, προσεκομε για σταυράματα, "to leap beyond the bounds;" meaning then, as at the present day, a giddy extravagant perdon.

HALTING, f. The act of going lame; the act of stumbling in a march; a failure.

HALTON, an ancient but decayed town in Cheshire. Its market is on Saturdays; and fairs, old Lady-day and April 5. It is pleasantly situated on a high hill, commanding a delightful and very extensive prospect of parts of thirteen surrounding counties. It stands on the road from Frodham to Runcorn, within about a mile of the latter, and near five of the former, and 186 miles from London. It had formerly a castle and a citadel, whose frite and ruins are now remaining, and are often visited by travellers. This castle was built anno 1071, and is a member of the duchy of Lancaster; which maintains a large jurisdiction in the county round it, by the name of Halton. For the honour of Halton, having a court of record, prison, &c. By inland navigation, this town has communication with the rivers Mersey, Dee, Ribble, Oufe, Trent, Derwent, Severn, Humber, Thames, Avon, &c; which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Lancaster, Welfmoreland, Stafford, Warwick, Leicester, Oxford, Worcesters, &c.

HALTWESEL, a town in the county of Northumberland, 317 miles north from London, in the road from Carlisle and Hexham to Newcastle, having the Tyne on the south side, and the Fose-way, which runs parallel to the Picts Wall, at a little distance on the north side. Fairs on May 14 and November 22; and a market on Thursdays. Its situation is lofty, and commands a fine prospect over the vale, which is bounded by Billitter-castle and the adjoining hills on one hand, and Heydon-bridge on the other. This place was plundered by the Scots in the reign of Elizabeth. It enjoys all the advantages of a healthful situation, and carries on a large manufactory of baize.

HALVAN, or CHALAN, a kingdom of Africa, in the kingdom of Pez, celebrated for its baths: ten miles south of Pez.

HALVE, v. a. [from half, halveis.] To divide into parts.

HALVES, interj. [from half, halveis being the plural.] An exclamation by which any one lays claim to an equal share:

Have you not seen how the divided dam
Runs to the.submit of her hungry lamb?
But when the twin eides halveis, the quifs the first. Cleaveland.

HALVING, f. Dividing into halves.

HALYARD. See HALLIARD.

HALYMOTE, f. A holy or ecclesiastical court; but there is a court in London, formerly held on the Sunday next before St. Thomas's day, called the halymote, or holy court, Caria Sanctiméd, for regulating the bakers of the city, &c. Blount.

HALYS, in ancient geography, a river of the Hither Asia, through which it had a long course, and was the boundary of Creous's kingdom to the eall. Running down from the foot of mount Taurus, through Cata-

Ionias and Cappadocia, it divided almost the whole of the Lower Asia, from the Sea of Cyprus to the Euxine, according to Herodotus. According to Strabo, himself a Cappadocian, it had its springs in the Great Cappa-

docia. It separated Paphlagonia from Cappadocia; and received its name apó to eida, from salt, because its waters were of a salt and bitter taste, from the nature of the soil over which they flowed. It is famous for the defeat of Creous king of Lydia, who was killed by the ambiguous word of this oracle: Ἰδὼν ἀτκελίαν μεγαλέν ἀγκάλαν. "If Creous passes over the Halys he shall destroy a great empire." That empire was his own. See Creusus, vol. v. p. 372, and the article Lydia.

HALY Werfcolk, f. People who accidentally en-

joyed lands reputed as being a church or sepulchre; for which pious labours they were exempt from all feudal and military services. It denoted such of the province of Durham in particular, as held their lands to defend the corf of St. Cuthbert; and who claimed the privilege not to be forced to go out of the bishopric, either by the king or bishop. Hyl. Dunelm. apó Wirtw. Ang. Sax. part. 1. p. 92.

HALYZIA, in ancient geography, a town of Epirus, near the Achaeus, where the Athenians obtained a naval victory over the Lacedemomians.

HAM, whether initial or final, is no other than the Saxon ham, a house, a farm, or village. Gibbon's Camden.

HAM, f. [Ham, Sax. hamme, Dut.] The hip; the hinder part of the articulation of the thigh with the knee.—The ham was much relaced; but there was some contraction remaining. Wiseman.—The thigh of a hog falted:

Who has not learn'd, freh furgeon and ham pye
Are no rewards for want and infamy? Pope.

HAM, [Heb. hot.] The younget fon of Noah. He was the father of Cuth, Mizraim, Phut, and Canaan; each wherof had the several countries peopled by them. With respect to Ham, it is believed that he had all Africa for his inheritance, and that he peopled it with his children.
His oracle in consequence Idmidce.

From Egypt his name and worship were brought into Chemmis, Plitta-chemmis, which are cantons of Egypt, and Sham by the name of their ancestors. And as to Ham's being

As for himself, it is supposed by some writers that he dwelt in Egypt; but M. Bassigne is of opinion that neither Ham nor Mizraim ever were in Egypt; but that their posterity settled in that country, and was called by the name of Ham as to Ham's being worshiped as Jupiter Hammon, he thinks people may have been led into this mistake by the similarity of names; and that Jupiter Hammon was the son, to which divine honors have been paid at all times in Egypt. Still, however, Africa is called the land of Ham, in several places of the Psalms. Pfl. lxxvii. 51. civ. 23. cv. 22.) (Psal. lxxvii. 51. civ. 23. cv. 22.) (Psal. Still, however, Africa is called the land of Ham, in several names; and that Jupiter Hammon was the sun, to which Ham was the Zeus of Greece, and the Jupiter of Latium. Cham or footsteps of the name of Ham observed in Psalms there worshipped. He, being the Apollo of the Greece; as indeed were the names of almost all the deities there worshipped. He, being the Apollo of the eui, was worshipped as the Sun, which was also called Shem and Shem. This has been the cause of much perplexity and mistake; for by these names many of his posterity have been referred to a wrong line, and reputed the sons of Shem; the title of one brother not being different from that of another real name. The only oracle in the first ages was that of Ham, who was worshipped as the Sun, and called El, and or; and hence these oracles are called Amphi, Onphi, Alphi, Elphi, Orphi, Upiti. In the most ancient accounts of Greece, Ham is called Iamus, and his priests Iamids. His oracle in consequence of this was called Iampis, and Iamps, which was the same term as Amphi. From Iambi came the measure Iambi, in which oracles of old were delivered. Ham among the Egyptians was called Tithrambus, which is the same name as the Dithyrambus of Diodorus. Macros, or Olimar, ou spirritus etiam Iafts, in uti eloquentia mutua, et eft fin. tnr in uti Iamides. Schol. in Pind. Olymp. Ode vi. Iamis in Nemeis, and reality the deity: his attendants the Iamids were persons of great power and repute. From the term Dithyrambus were derived the Iamides of the Greeks and the triumphus of the Romans.

Ham was the Hermes of the Egyptians, and his oracle was called Ompỉ, and when particularly spoken of as the oracle, it was expressed Pompis, and Pompis. The worship of Ham, therefore, as it was the most ancient, so it was the most universal of any in the world. It was at first the prevailing religion of Greece; and was propagated over all the sea-coast of Europe: from whence it extended itself into the inland provinces. It was established in Gaul and Britain; and was the original religion of this island, which the Druids in aftertimes adopted. In the title of emir. The geographer, Abulfeda, was prince of Hamah, from the year 1342 to 1345. Numbers of wild asses are found in the country between this place and Aleppo. It is 124 miles north of Damascus, and sixty-eight south-south-west of Aleppo.

Hamamelis, s. [Gr. so called because it flowers with the apple.] Witch-hazel; in botany, a genus of the class tetrandria, order digynia, natural order of berberidies, joss. The generic characters are—Calyx involucrose three-leaved, three-flowered; the two inner petals roundish, smaller, blunt; the three outer lanceolate; petals three-leaved, smaller, roundish; the inner four-leaved, upright, the leaflets oblong, blunt, equal. Corolla petals four, linear, equal, very long, blunt, reflex; nectary of four truncate leaflets, growing to the corolla. Stamina: filaments four, linear, shorter than the calyx; anthers: two-horned, bent in. Pubillus: germ ovate, villose, ending in two styles, which are of the same length with the stamens; stigmas capitate. Pericarpium: nut ovate, half covered with the calyx, blunt, furrowed on both sides at the tip, having two little horns spreading horizontally, two celled, two-valved. Seeds: one in each cell, oblong, narrow at the base. Effusial Character. Involucre three-leaved; perianthium four-leaved; petals four; nut two-horned, two-celled.

Hamamelis Virginica, or witch-hazel; a single species. This tree has a woody stem, from two to three feet high, sending out many slender branches. Leaves oval, incised on their edges, having great resemblance to those of the hazel, and placed alternately on the branches: these fall away in autumn, and then the flowers come out in clusters from the joints; they are not followed by seeds in this country. It seems to be polygamous, for in Virginia it is dioecious, with axillary, peduncled, crowded, petaloid, flowers: in Carolina it is monoeccious, with terminating, many-flamed, apetalous, flowers, in spikes. Whether these be distinct species or not, may be doubted; since they are so very much alike in the herb. In New England, the germ endures the severity of their winters, and the fruit does not ripen till the September succeeding, when ripe fruit and fresh blossoms will be found on the same tree. The fruitfoliation is shown on the Botany Plate X. fig. 14-17.

The Indians consider this tree as a valuable article in their materia medica. They apply the bark, which is sedative and disinfentient, to painful tumours and external inflammations. A cataplasma of the inner rind is found to be very efficacious in removing painful inflammations of the eyes.

It may be propagated by laying down the young branches in autumn, which will take root in one year, but many of the plants which are in the gardens, have been produced from seeds which came from America; these seeds always remain a whole year in the ground, so they should be sown in pots, which may be plunged into the ground in a sandy part of the garden, where they may remain all the summer, and then take root, but to keep the pots clean from weeds, and in very dry weather to water them now and then; in autumn 3 C one
the pots may be removed to a warmer situation, and plunged into the ground under a warm hedge; and, if the winter should prove very severe, they should have some light covering thrown over the pots, which will secure the seeds from being destroyed. In the spring the plants will come up; therefore, as the season grows stronger, the plants will have made good progress by autumn, when they should be transplanted, either into small pots, or in a nursery-bed, where in one, or at most two years, time, they will be strong enough to plant where they are designed to remain. They love a moist soil, and a shady situation.

Hamamet, a town of Africa, in the kingdom of Tunis, on the north side of a bay, called the Gulf of Hamamet, and on the east coast of Tunis: thirty miles south of Tunis.

Ham'amet, [Heb, an uproar.] A man's name.

Hamars, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Falaise: four leagues and three quarters west-north-west of Falaise, and four and a half south-south-west of Caen.

Ham'veted, adj. [hamatus, Lat.] Hooked; set with hooks.

Hamath (Land of), a part of Phenecian Syria, bordering upon the northern boundary of Palestine, and the true limits of the latter on that quarter. In the reign of king David it appears to have been an independent state, and subject to a king named Toi, or Tou, who was on a friendly footing with David, and who congratulated him on his successes over his enemies. But in the reign of Hosea king of Israel, this country was under the dominion of Assyria; and in the reign of Zechariah king of Judah, under that of Babylon; at which time Riblah appears to have been its capital. Num. xxv. 19, 20. 2 Sam. viii. 9, 10. 2 Kings, xvii. 24. xxiii. 33. xxv. 6.

Hamath-Zobah, probably the capital of the kingdom of Zobah in Syria; subdued by Solomon king of Israel. 2 Chron. viii. 3.

Hamathite, an inhabitant of Hamath.

Hamaxoboti, or Hamaxobians, or Hamaxobii. [From αμαξοβις, Gr. a carriage, or chariot, and ζω'θς, life.] In ancient geography, a people who had no lions, but lived in carriages. The Hamaxobii were an ancient people of Sarmatia Europaea, who instead of houses had a sort of caravans, called guhsmans, for their carriages. They had no fixed place, and subject to a king named Toi, or Tou, who was on a friendly footing with David, and who congratulated him on his successes over his enemies.

Ham'bacht, a town of Germany, in the circle of the Calvados; situated forty miles from Honfleur, and near the sea. It is a good place for colonists, and is celebrated for its manufactures of cotton, silk, &c.

Ham'blin, a town of New Jersey, in the State of New York, on the river Hackensack, and near the commencement of the Jersey Palisades.

Ham'ber, a town of England, in the county of Kent, on the south side of the Thames, and near the river Medway. It is a pleasant place, and is celebrated for its manufactures of worsted, silk, &c.

Ham'berge, a town of Germany, in the circle of the Calvados, and chief place of a canton, in the district of Falaise: four leagues and three quarters west-north-west of Falaise, and four and a half south-south-west of Caen.

Ham'berger, [George Christopher], professor and second librarian. He was an affiduous student, and in 1772 he published an enlarged and improved edition, in which were included all the German authors who had died between the year 1767 and that period. A continuation of this literary catalogue was undertaken by professor Menzel of Erlangen, who has since added to it several volumes.

Ham'berger, John Albert, a German mathematician, born at Beyerberg, in Franconia, in 1662. He became professor of natural philosophy and of the mathematics in the university of Jena, and died at that place in 1716. Among his most valued productions are treatises, 1. De Iride Diluvii. 2. De Opticis Oculorum Vitris. 3. De Hydraulica. 4. De Frigore. 5. De Baph Compiti exiraphilios. &c.

Ham'bers, a town of France, in the department of the Mayenne: ten miles south-east of Mayenne.

Ham'ble, a town of England, in the county of Middlesex, on the river Thames, and near the town of Slough. It is a pleasant place, and is celebrated for its manufactures of worsted, silk, &c.

Ham'bleton, a market town in the county of Yorkshire, and in the north of England. It is situated on the river Wharfe, and near the town of Skipton. It is a pleasant place, and is celebrated for its manufactures of wool, &c.

Ham'bleton, a market town in the county of Yorkshire, and in the north of England. It is situated on the river Wharfe, and near the town of Skipton. It is a pleasant place, and is celebrated for its manufactures of wool, &c.

Ham'bleton, a market town in the county of Yorkshire, and in the north of England. It is situated on the river Wharfe, and near the town of Skipton. It is a pleasant place, and is celebrated for its manufactures of wool, &c.

Ham'bleton, a market town in the county of Yorkshire, and in the north of England. It is situated on the river Wharfe, and near the town of Skipton. It is a pleasant place, and is celebrated for its manufactures of wool, &c.

Ham'bleton, a market town in the county of Yorkshire, and in the north of England. It is situated on the river Wharfe, and near the town of Skipton. It is a pleasant place, and is celebrated for its manufactures of wool, &c.

Ham'bleton, a market town in the county of Yorkshire, and in the north of England. It is situated on the river Wharfe, and near the town of Skipton. It is a pleasant place, and is celebrated for its manufactures of wool, &c.

Ham'bleton, a market town in the county of Yorkshire, and in the north of England. It is situated on the river Wharfe, and near the town of Skipton. It is a pleasant place, and is celebrated for its manufactures of wool, &c.

Ham'bleton, a market town in the county of Yorkshire, and in the north of England. It is situated on the river Wharfe, and near the town of Skipton. It is a pleasant place, and is celebrated for its manufactures of wool, &c.
Elbe, Aller, and Bille. The Elbe, which at the city, the little islands included, is not less than a German mile in breadth, besides forming two spacious branches, runs through most parts of the city in canals, which, being generally broad and deep, are of prodigious convenience to the merchants, whose houses stand on them. In these canals, as well as in the river itself, even to the distance of several miles above Hamburg, the tide ebbs and flows twice a-day, which is also in many respects of service to the inhabitants, though not without the frequent and great inconvenience of inundations occasioned by the north-west winds, at which time the lower buildings and cellars are frequently filled with water. The bridges over these canals are no less than eighty.

Englifli Houfe formed in a building called the Sternkanze and lastly before the whole body; and on the approbation to the magiftracy; but in all affairs of general concern to the farmers, as likewise most of the neighbouring parishioners, who are mostly under the neighbouring jurisdiction, together with a greater number of others on the land-side, pass all ships going to or coming from sea. Every morning at the opening of it is seen a multitude of boats and small vessels, whose cargoes consist of milk, fruits, and all kinds of provisions, all preening in at the same time for a market; and in this manner the country people, who are mostly under the neighbouring jurisdiction, together with a greater number of others on the land-side in carriages, as likewise most of the neighbouring parishioners, daily bring in subsistence necessary to the city, and on the other hand return home with their own.

The exercise of certain regalia here appertains solely to the burgromasters. The aldermen, together with the burgesses, assemble in the general chamber, and the burgesses sit at the deliberations: and in order to give validity to any motion made by the magistracy, in cases relative to the joint assembly of the magistracy and people, the consent of both sides is required. All points touching the imposition of taxes and new laws, are by the magistracy laid before the first college of the burgesses, then before the second, next before the third, and lastly before the whole body; and on the approbation of both classes, is termed a decree of the magistracy and burgery, or simply a reseda. The magistracy is usually composed of thirty-seven persons, or rather thirty-six; that is to say, four burgomasters, four syndics, two aldermen, two surveyors of revenue, and four secretaries, of whom one is protonimous, and another acts as recorder, but the votes are limited to the burgomasters and the aldermen, of the first of whom one must be a trader, and of the latter thirteen traders, and the rest graduates. Any person elected into the magistracy, and declining the post of the magistracy, and deserting the office, must depart the city. Lutheranism is the established religion of the place, and all sects of other religions are tolerated. But both Papists and Calvinists have an opportunity of attending divine worship at the envoys of the emperor, and other sovereigns, to the circle of Lower Saxony, who reside in the city; and the English Hamburg Company have divine service performed in a building called the English House.

Formerly a principal occupation of many of the inhabitants of Hamburg consisted in brewing, and the cloth manufacture; and even to this day the older companies, of which each has its appointed patron in the corporation, enjoy many privileges. At present, the principal manufacture here is, beyond dispute, the sugar refinery, for which, whether it be owing to the quality of the water, or whatever be the case, Hamburg has hitherto been highly distinguished. The cotton, flax, silk, and worsted, goods, as well as thread, ribbon, and velvet, manufactures, are also carried on to a great extent. With respect to its several branches of commerce, linen, cloth, silk-ware, wine, sugar, coffee, colours, spices, metals, tobacco, wood, leather, grain, dried and salt fish, train-oil, and furs, are accounted the most considerable of them; though this has not been entirely ascertained, the merchants having up everything that offers, and the convenient situation of the city drawing thither a great variety of different cargoes. No nation, however, can possibly be formed of the amount of the exports and imports of Hamburg, as the merchants observe the most profound secrecy on that head. An uncommon benefit to the merchants of Hamburg is the specie bank, which, for the good of its credit and prudent regulations, is by means of any in Europe. Its founder's name was Beckman, who became afterwards a senator, and refe to be the burgomaster of the city. It was founded in 1673, on the plan of the Italian banks, and that of the Bank of England; and accordingly is charged with the scientific business of the state, and the supply of the public granaries; as also the mintage. This last privilege, which it holds by charter from the emperors, it has always exercised, Hamburg dukats being to be seen of every year for a long time past, not to mention the Banco Portuguese, of which thosc called whole weight, and the half ones five ducats. Of silver money it coin large quantities. The standard observed here is precisely the same with that of Lubec.

One of the best regulations in Hamburg, and that which reflects the highest reputation on its police, is the wife and adequate provision made for the poor. In 1788, that great commercial city was found to contain no less than 170,000 inhabitants: out of which were found to be 7000 idle and beggarly poor, besides 2500 in the hospitals. Considerable attempts to give them relief had taken place before 1788; but in that year a public institution was formed for that purpose, under the sanction of the magistrates. All the sums contributed in alms to the poor, as well as what was collected by annual voluntary subscriptions solicited through the whole town, were formed into one stock. The town was divided into sixty districts, each containing nearly an equal number of poor; to each district three citizens were chosen for three years as overseers, and a committee was appointed of ten directors, five of them senators. The first object being relief, a calculation was made of what each pauper required, for a bare subsistence; and it was established as a fundamental principle, to reduce this support lower than what any industrious man or woman could earn by their labour. It was fixed at one florin and sixpence weekly. The next point was to find them work. The spinning of flax-yarn was selected, and the payment was ascertained not by weight but by measure. The poor who wanted work had clean flax delivered to them at a certain low price, and the yarn when spun was bought of them at a rate thirty per cent. above the usual spinning price. A school was opened for teaching those who required it, and when they had learnt the work, it was sold in its place, when they were dismissed with a wheel and a pound of flax. Thus all those whose former earnings were less than one shilling and sixpence a-week, and who were able to spin, had work supplied them by the society sufficient for their support, and were declared to no longer objects of weekly alms. As to the indigent poor,
poor, after the quantity of work which they were able to do had been ascertained, the overseer was directed to pay them weekly as much as it fell short of one shilling and sixpence. Furnishing employment, therefore, and making it the interest of the poor to work, was the basis of the whole design.

Next to this evil to be obviated, was the next evil to be obviated. For this purpose, an hospital was provided, and also an establishment for taking care of the sick at their own houses. Physicians, surgeons, and midwives, were appointed to the several quarters, and not only medicine, but diet, and money, were distributed as occasion required. The burthen of a numerous family was also to be alleviated, not only to the lowest poor, but to widows, and to indigent couples in a somewhat better way of employment. Weekly allowances were made to the parents in some cases, in others the younger children were boarded out in other families; and schools were provided for all the poor children from six to sixteen years of age, where two-thirds of their time were allotted to work, and one-third to instruction. It was made a rule, on which the second hinge of the institution is said to turn, "that to no family should any relief be allowed for a child past six years of age; but that this child, being sent to school, should receive, not only the payment of his work, but also an allowance, in the compound ratio of his attendance at school, his behaviour, and his application to work."

The very definite condition of the poor at the commencement of this institution, rendered it necessary to provide clothes and bedding, as well as to redeem the goods which they had pawned. These articles were secured from being again pawned, by being indelibly marked as the property of the institution. The clothes were made by some at the schools. And as foreigners flock into Hamburg from the poor countries round, it was established that not less than three years' residence should entitle to relief; but an hospital was opened for foreign poor, where they might live three days, and then be passed on with a viaticum. Such is the general plan of the management of the poor adopted in Hamburg, and with such success, that a great reduction has been made in the number of families requiring relief, and in the expenditure for their support; at the same time that the mortality among the sick poor has greatly decreased, and in all respects their condition has been so much amended, that not a single beggar is to be seen in the streets.

Next to this judicious plan for overcoming the evils and diffrets of poverty, might be reckoned, in the philanthropic estimate of humanity, that noble establishment called the Orphan-house. No less than sixty infantless children are maintained in it. The boys are taught to read, write, and to cipher, with a little mechanical drawing; the girls are instructed in reading, writing, spinning, needlework, and embroidery. From this charity, most of the maid-servants in Hamburg are taken; and the boys are dispersed among the different manufactures; and, to the gratification of the ropowers of this excellent charity it is found, that in consequence of education, both boys and girls, as in a similar plan of education adopted at Edinburgh, are to be prised for their orderly behaviour and unwearyed industry.

The coffee-houses of Hamburg differ widely from those in the inland parts of Germany. They are not only the resort of the idle and the inquisitive, but people of business repair to them on many accounts; and in those which are situated near the exchange, very important affairs are often transacted. All pieces of intelligence from the various parts of Europe find their way with incredible rapidity to Hamburg, and get into circulation through these coffee-houses. They are amply provided with newspapers from all countries. Every body in this city being more or less concerned in trade, all take a great interest in the news of the day. Here all is activity and life, motion, bustling, and energy; and all that can be wanted in the whole world is brought to market.

That period being elapsed, they must renew their ticket, and every month pay a few marks, during six months; after which they cease to be strangers, and can be no longer admitted as such.

Among the public entertainments of Hamburg, may be reckoned the Vauxhall. It is curious that this entertainment came originally from England, where there is so much rainy weather; and where it is at all times half buried in mud and slush. This indeed is not a public theatre, but a place of amusement for strangers; whereas in foreign countries, where mud is unknown, it would be so agreeable to pass a part of the night in the open air, they know very little about a Vauxhall; for in all Italy there is no more than one, besides that at Milan. The climate of Hamburg is far more favourable than that of England for such an entertainment.

Though the civil constitution of Hamburg seems principally calculated for the encouragement and protection of commerce, yet great advances have been made under its auspices in the acts of social life, and in the improvement of literature and the sciences; infomuch that a learned Society, calculated for the promotion of human knowledge, has been lately established at Hamburg, and some few volumes of their interesting Transactions have been published; which has long been the boast of their imperial city.

Hamburg, Lubeck, and Bremen, are the only remains of the ancient Hanseatic confederacy, once so celebrated and powerful. The rent house has long bowed to a foreign yoke, and retain nothing of their former splendour, except the ruins of palaces, and walls and guilds falling to decay. Time, which in turn seems destined to destroy all human institutions, now at least threatens the destruction of Hamburg; for its freedom is no more. On Wednesday the 19th of November 1806, a division of the French imperial army, under general Mortier, for-
normally took possession of the city in the name of Napoleon Bonaparte. The next day French officers mounted guard at all the public offices and gates, and free quarters were provided for the troops, who were distributed at the houses of the citizens. A few hours only had elapsed, when the names of the generals, colonels, and commissaries, of the French army, were inscribed on the doors of the principal buildings, extremely peculiar in appearance. The military at war occupied the houses of the British minister, which he entered half an hour after the latter had quitted it. The head-quarters of Mortier were at a senator’s in the Bilichen. One of the first measures was to demand all the English property, in whatever form it might appear, at the carriers’ visits were appointed to ascertain the validity of purpose the merchants were compelled to give an estimate, which he entered half an hour after the latter had quitted the city. General Mortier signified, on receiving this communication, that it was his determination not to relax a shilling of his demand. Means were instantly taken to carry this scheme of pillage into execution; and for this purpose the merchants were compelled to give an estimate, which he entered half an hour after the latter had quitted the city. General Mortier signified, on receiving this communication, that it was his determination not to relax a shilling of his demand. Means were instantly taken to enforce such a requisition would be the total ruin of the city. General Mortier signified, on receiving this communication, that it was his determination not to relax a shilling of his demand. Means were instantly taken to enforce such violent measures. The violation of all the English property in their hands; domestic courts were appointed to ascertain the validity of such accounts; and to enforce these violent measures many of the most respectable persons were put under arrest, to operate on the public mind by intimidation. — Such is the fallen state of the once free and independent city of Hamburg.

Hamburg, a town of the American States, in New Jersey, eighteen miles from Gothen in New York, and twenty from Newton or Sufflet-court-house.

Hamburg, a handsome town of the American States, in Burke’s county, Pennsylvania, situated on the east side of Schuykill. Here are a German Lutheran and Calvinist church, united. It is eighteen miles north of the city, and twenty from Newtown or Suffet-court-house. The communication on the top of it. But it is most noted for a castle, which M. du Hamel acquired on his travels, he sat down on the top of it. But it is most noted for a castle, which M. du Hamel acquired on his travels, he sat down and was de.

Hamburg Company. See the article Company, vol. iv. p. 83.

Hamburger, f. A native of Hamburg; an inhabitant of Hamburg.

Hamburg, a town of the American States, in New Haven county, Connecticut, about eight miles north of New Haven city.

Hamden, a township of the American States, in New Haven county, Connecticut, about eight miles north of New Haven city.

Hamden, a township of the American States, in the district of Maine, in Hancock county, on the west side of Penobscot river, opposite Orrington.

Hamden Hill, a remarkable elevation in Somersethire, with a considerable Roman encampment or fortification on the top of it. But it is most noted for a castle, which M. du Hamel acquired on his travels, he sat down and became exceedingly durable, and will retain for centuries all the acute angles and sharp edges of its workshop.

Ham, f. [Hama, Sax.] The collar by which a horse draws in a wagon.

Hamedatha, [Heb. a measure.] A man’s name.

Hamel, a town of France, in the department of the Orte, and chief place of a canton, in the district of Guise, where was the college of Orléans. This college was afterwards transferred to the benefice of Neuilly upon the Seine, and its private hours were devoted to literary and philosophical studies; and here he compiled his Afronomica Physica, and his treatise De Meteoris & Phenomenis, both published in 1600. In 1663 he relinquished his cure at Neuilly, upon being appointed chancellor of the church at Bayeux. In the same year he published one of the most celebrated of his performances, entitled De Confusis Vickers & Nova Philosophia, 4to. His reputation was now so high in the philosophical world, that upon the establishment of the royal academy of sciences by Louis XIV. in 1666, he was appointed the secretary of that institution. In 1668, when M. Colbert de Croisy was sent plenipotentiary to negotiate the peace of Aix-la-Chapelle, he engaged M. du Hamel to accompany him for the purpose of drawing up the diplomatic papers, which were at that time written in the Latin language. After the treaty was concluded, he accompanied M. de Croisy to England, in order to form an acquaintance with the learned men of that nation, particularly the illustrious Boyle, who opened to him all his treasures of experimental philosophy. From England he went to Holland, and visited the men of science in that country; after which he returned to France.

After the accession of knowledge and information which M. du Hamel acquired on his travels, he sat down very diligently to prepare his different works for the press. In 1670, he published his treatise De Corpo animato, which two years afterwards was followed by his book De Morte Humanae; and in 1672 appeared his treatise De Corpore animato, in which his reconciliations and deductions are founded on experiment, and particularly on anatomy. In 1678 he published at Paris his Physiologia rusticorum, deum, with books dedicated to the benefice of Neuilly, and St. John’s College, Cambridge.

Hamel du Monceau (Henry Louis du), an eminent philosopher, born at Paris in 1700. He employed his whole life in scientific and useful researches, and from the year 1728 he made himself known as a writer in the
Hamel, a town of Germany, in the circle of the Upper Rhine, and bishopric of Fulda: twenty-four miles south of Fulda, and sixteen weft of Weinfheurft. HAMELIA, s. [so named from Jean Baptifhe du Hamel du Meusne, the celebrated author of several valuable books on trees.] In botany, a genus of the clafs pentanglia, and specific name from the town, from whence it derives its name. The generic characters are—Calyx : perianthium five-parted, equal, small, acute. Stamina : filaments subulate, inserted at the middle of the corolla; antherae oblong, linear, the same length with the corolla. Filifillum : germ ovate, with a conical tip, inferior, flabe, filiform, the fame length with the corolla; stigma linear, blunt. Pericarpium : berry oval, furrowed, five-celled, inferior, many-seeded. 

Species. 1. Hamelia patens, or declining Hamelia: racemes terminating, coloured; leaves ternate, villose, pubefcent. This is a shrub or small tree growing five or fix feet high. Branches diverging, spreading, round, smooth. Leaves ovate, acuminate, entire, nerved, the upper surface pubefcent, hoary on the back, villose, soft, coloured about the edge; flowers directed one way, five-petalied, large, bright red or scarlet; there is one fo- litary flower, solitary at the ends of the flowers. Native of Jamaica. According to Browne, the size and the different dispositions of their leaves make the whole different between this and the second species. 

2. Hamelia grandiflora, or great-flowered Hamelia: racemes terminating, leaves oblong, wedge-shaped, acuminate, very smooth; flowers pedicelled. This is a native of Jamaica, and the different parts of the West Indies. It flowers here from September to November; and was introduced in 1778, by Thomas Clark, M. D. 

3. Hamelia axillaris, or axillary Hamelia: subherbae- ceous; racemes axillary; flowers mostly directed one way, fefile; leaves ovate-lanceolate. Native of Jamaica and Hispaniola. 

4. Hamelia chrysantha, or yellow-flowered Hamelia: racemes terminating; leaves oblong, wedge-shaped, acuminate, very smooth; flowers pedicelled. This is a native of Jamaica, and the different parts of the West Indies. It flowers here from September to November; and was introduced in 1778, by Thomas Clark, M. D. 

Propagation and Culture. This plant is propagated by seeds, when they can be procured fresh from the country, or by cuttings in small pots, and plunged into a moderate hot-bed: the plants generally appear in about five or six weeks after, and should then be treated in the same way as other plants from the same countries; giving them proper air in warm weather, and gently refreshing them with water; and when they are fit to transplant, they should be each planted in a small pot, plunging them into the hot-bed again, where they should be shaded from the sun until they have taken new root, when they should have air and moisture according to the warmth of the season. In the autumn the plants must be removed into the tan- tiove, plunging the pots into the bed, where they should remain until the following July and August, when it makes a pretty appearance. After this the seeds of this plant are seldom brought to England, so the plant may be propagated by cuttings, which if planted in small pots, plunged into a moderate hot-bed, and closely covered with either bell or hand glasses, will put out roots in about six weeks, and may then be treated in the same way as the feeding plants.
eclesiastical and other splendid buildings. There are only two churches. The magistrates are possessed of the civil and criminal jurisdiction. It formerly belonged to the abbey of Fulda, from which it was sold to the bishop of Minden. In the latter end of the sixteenth century, it came into the possession of the elder line of Wolfenbuttel, who died childless in 1632, and on their departure, taken by capitulation, by the Imperialists, who continued there till the year 1633, to the great oppression of the place, and, in 1635, put the bishop of Hildesheim in possession of one half of the town, which had been mortgaged to him; but this mortgage being redeemable for a sum of gold agreed upon, the royal burghers raised the money, and paid it at the town-house of Hildesheim, of which duke Christian expressed his grateful sense to them; and in consideration of this their zeal, in 1631 granted to the town the toll and police. In the same year, duke Frederick Ulrich transferred the town to duke Christian, of the Zell line, to whose representatives it did private homage. In 1633, the imperial garrison surrendered it to duke George, as general of the Swedish forces. In 1637, it was taken, on capitulation, by the French, who evacuated it again the following year. It is twenty-eight miles south-west of Hanover, and eighteen south-east of Minden. The town is 32. 60 N. lon. 30. 30 E. Ferro.

down said Little Miami river to the place of beginning; thence with a line drawn due east to the Little Miami, and down the said Ohio river, to the mouth of the Little Miami; and down the said Miami river to the place of beginning."}

HAMILTON, a town of the American States, in Herkimer county, New-York, in the extensive township of Water Vilet, formerly called the Glass Factory; and has its present name in honour of that great patriot of American manufactures, the late secretary of the treasury of the United States. It lies ten miles west of Albany, two miles from the Schenectady road; and is one of the most decisive efforts of private enterprise in the manufacturing line, as yet exhibited in North America. The glass manufactory is now so well establised, and so happily situated for the supply of the northern and western parts of the States of New-York, as well as Vermont and Canada, that it is to be expected the proprietors will be amply rewarded for their great and expensive exertions. The glass is also in good reputation. A copious stream runs through the heart of the settlement, which lies high; and being surrounded by pine plants the air is highly salubrious. The great Schoharie road crosses the settlement. The enterprising proprietors of the glass and other works in this thriving settlement were incorporated by the legislature of New-York in the spring of 1797, by the name of The Hamilton Manufacturing Society. In the neighbourhood of these glass works, a block was cut out of an ancient tree, not many years ago, containing evident marks of an axe or some edge tool, made 185 years ago, determined according to the usual and certain mode of ascertaining the age of trees. The block is preserved in Albany as a curiosity. Henry Hudson ascended the river which bears his name, as high as Albany, in the autumn of 1609, 187 years ago, and their marks were probably made by him or some of his men, jutting them to the fooying rays of the sun; afterwards they pick them, and leave them in that manner until they are quite dry, without losing any of their substance or flavour. The inhabitants are Mahometans, large, robust, and well clothed. They all submitted to China over the latter end of the seventeenth century. About the latter end of the seventeenth century.

HAMILTON, a town of Scotland, in Clydesdale, on the river Clyde, eleven miles south-east of Glasgow; from whence the noble family of Hamilton take their name and title of duke. The town is seated in the middle of a very agreeable plain; distant thirteen miles north-west from Lanark.

HAMILTON. There are three townships of this name, belonging to the American States in Pennsylvania. In one, in each of the counties of York, Franklin, and Northampton.

HAMILTON, a town of the American States, in Herkimer county, New-York, twelve miles square, twenty-fourth of old Fort Schuyler, a level tract of good land. Orifke or Ohiokee creek, a water of Mohawk, Chemung, a water of Susquehannah, rise in this township. In 1796 there were 1224 inhabitants, of whom 156 were electors.

land in 1646. His mother was filter to the duke of Ormond, viceroy of that island. The troubles of the time drove his family to France while he was an infant, and he was brought up in the language and religion of that country. He made several visits to England in the reign of Charles II., but his religion prevented him from obtaining any public employment here. James II. gave him a regiment of infantry in Ireland, and made him governor of Limerick; but, upon the ruin of that monarch's affairs, he was obliged to accompany him back to France, which he never afterwards left. He was greatly admired in the first circles for his wit and polite-ness, joined to the most estimable qualities of the heart. He died in 1759, at the age of seventy-four. His works are in the French language, and were printed collectively in 6 vols. 12mo. in 1759. They consist of Poems; of Fairy Tales; and of the Memoirs of Count Grammont, the principal of his compositions. This, says Voltaire, "is of all books that in which a slender ground-work is set off with the most lively and agreeable style." The late lord Orford (Horace Walpole) printed a splendid edition of it at his private press, adorned with fine engravings from original portraits.

HAM, f. In chronology, the eleventh month of the Ethiopian year, nearly answering to August. From which our poet derived the principal incidents of his play is founded upon facts, but so deeply buried in remote antiquity, that it is difficult to discriminate truth from fable. Saxo-Grammaticus, who flourished in the 12th century, is the earliest historian of Denmark that relates the adventures of Hamlet. His account is extrated, and much altered, by Belleforest a French author.

HAMLET, a prince celebrated in the annals of Denmark; whose name has been rendered familiar in this country, and his story interesting, by being the subject of one of the noblest tragedies of our immortal Shakespeare. Adjoining to a royal palace, which stands about half a mile from that of Cronborg in Elsinoure, is a garden called Hamlet's garden, and the tradition is that the very spot where the murder of his father was perpetrated. The house is of modern date, and is situated at the foot of a sandy ridge near the sea. The garden occupies the side of the hill, and is laid out in terraces rising one above another. Elsinour is the scene of Shakespeare's Hamlet; and the original history from which our poet derived the principal incidents of his play is founded upon facts, but so deeply buried in remote antiquity, that it is difficult to discriminate truth from fable. Saxo-Grammaticus, who flourished in the 12th century, is the earliest historian of Denmark that relates the adventures of Hamlet. His account is extrated, and much altered, by Belleforest a French author.

HAMM, a town of Germany, in the circle of Westphalia, and county of Mark, of which it is the capital; large, well built, and surrounded with ditches and palisades, which serve for walls. The Calvinists have an academy, with three professors, a Latin school, and a parish church. The Lutherans have a church, and the Roman-Catholics a convent. A little to the west of the town is a fortresses, called Fort Ferdinand. Hamm is a place of good trade, and was formerly Hanseatic. The linen bleaching-works are fine and extensive; seventeen miles south of Munster. Lat. 51. 42. N. lon. 45. 12. E. Ferro.

HAMMA, f. In old records, a close joining to a house, acroft, a little meadow.

HAMMAMFARAN, the name of a hot spring which rises by two apertures out of a rock, at the foot of a high mountain, in a high plain; it is used in baths by the neighbouring sick, who commonly stay forty days for a cure, during which their only food is a fruit, called lajasf, which grows here. An extensive burying place near the baths would seem to suggest some doubts of the beneficial effects of this regimen. The tradition that the Jews passed this way, and that Pharaoh's army was drowned here, has occasioned this place to receive the name of Birket-el-Faraun. The Arabs are taught to believe that Pharaoh is doing penance at the bottom of this well, and vomits up the sulphureous vapour with which the water is impregnated. Nebuur.

HAMMAMLEEF, a town of Africa, in the kingdom of Tunis, celebrated for its baths: thirteen miles south-west of Tunis.

HAMMAMLU, a town of Asiatic Turkey, in the province of Natolia; thirty-six miles west of Kara-hisar.

HAMMATH, a city of Palesine, belonging to the tribe of Naphtali; probably the same with Hammath-dor. Jefu. xix. 35.

HAMMEDATH, [Heb.] A man's name.

HAMMEL, v. a. To hammer; to hough. Scott.

HAMMELCH, [Heb.] A man's name.

HAMMELING, f. In the law, the act of hammering. Dif. of Arts.

HAMMEL'S TOWN, a town of the American States, in Dauphine county, Pennsylvania; five miles from Susquehannah river, and eighty-five from Philadelphia. Hamm. f. [hamep, Sax. hammer, Dan.] The instrument consisting of a long handle and heavy head, with which anything is forged or driven. The smith every morning rifes at his hammer and his anvil. Smuth.

He pitch'd upon the plain
His mighty camp, and, when the day return'd,
The country wafted, and the hamelets burn'd. Dryden.

The armourers,
With bufty hammers closing rivets up,
Give dreadful note of preparation. Shakespeare.

Any thing destructive. — That renowned pillar of truth
And hammer of heresies, St. Augustine. Hakewell.

The hammer is an instrument of great importance in several of the mechanical arts, as well as in many inferior handicraft employments. In fulling-mills, and divers works it is a large way, and divers trades are contructed trades, which are imitated by wood or horn. Among the handicraft trades, the principal employment of the hammer is in works of the forge; such as in making edge-tools, hard-ware, and the numerous purposes of the smith, who is obliged to use a series of hammers of the following denominations: 1. The hand-hammer, which is of such weight that it may be wielded or governed with one hand at the anvil. 2. The up-hand fledge, used with both hands, and seldom lifted above the head. 3. The about-fledge, which is the largest hammer of all, and held by both hands at the farthest end of the handle; and being swung at arm's length over the head, is made to fall upon the work with as heavy a stroke as possible. 4. The riveting-hammer, which is seldom used at the forge unless upon final work. A very great improvement has been lately made in the forge hammer, by Mr. George Walby, of Goswell-street, London. This hammer is calculated for forging edge-tools, bricklayers' trowels, rounding of ships' bolts, beating gold, tin foil, planishing brats, copper, or other metallic plates, or for any kind of work in which a large hammer may be required upon a simple principle. The weight of this hammer is seventy pounds, which may be readily worked by one man, with the speed of three hundred blows per minute, with the greatest accuracy and ease; and it performs the work of two or three men. The feel is kept in better tem-
per by this hammer, because it requires fewer heats in doing the same work than in the common way. The trowels made by it will bear any pressure or bending, and return immediately by their elasticity to their original shape; and they will even cut a chip from a bar of solid iron, without hurting their edge: they are also lighter and more handy than common trowels, and serve much longer in use. This hammer is correctly delineated in the annexed Engraving.

Fig. 1, represents the machinery by which the hammer is made to act. A, a block of oak, to which the machinery is affixed. B, the wheel or nave, in which the hammer-handle C is fixed; and also the chains which give motion to the hammer by the quadrant marked D E E, are the two levers which work the quadrant D F F, two pedals, on which the person who works the machine treads alternately, holding the levers in his hands: when he treads on the right pedal F, he lifts the hand-levers E E, which motion raises the hammer C; when he treads on the left-hand pedal, he presses on the same levers, which motion lets fall the hammer. G, a rack, which moves perpendicularly by the action of a strong wooden spring H, placed in a trough underneath the centre of the machine; the rack is kept close to the quadrant K by a bridge S, containing a small friction roller. I, an additional steel spring, which is to be lifted up by the power over the machine, in order to give more efficacy to the wooden spring H, when fewer hands are at work. K, the quadrant contained in the centre of the oak block A, under the nave B, which affords in raising and depressing the hammer, by the alternate actions of the pedals F F. L, a lever fixed on the axis of the quadrant K; which, at the time it depresses the rack G, pulls the hammer-handle C by the chain M, which adds to the power of the blow. N O, represent two side levers, which are to be worked by two men, whenever more power is required. P P, represent other two pedals, on which a man treads alternately, to give motion to the hammer, having an upright rod or chain to each pedal; one rod is connected from the right pedal P, to the lever Q, which raises the hammer; the other rod, from the left pedal P, is connected to the handle of the hammer C; when the man treads on the left pedal P, he acts upon the hammer C, and, by lifting the lever O with both hands at the same time, gives double force to the blow. Q, a wooden spring or flop, which prevents the hammer from rising too high, and accelerates its fall. R, a bridle, which supports the wooden spring Q. S S, two iron standards, with holes in each, to raise or fall the wooden spring. T, a wooden standard, to support one end of the wooden spring Q. V, a steel tempered spring standard, to support the hammer whilst out of action; it also gives ease to the springs, and prevents the heat of the anvil from entering the face of the hammer. U, a solid block of oak in which the anvil is fixed. W, the anvil, with a hollow doom-tail on the top for the reception of different faces, as the various kinds of work may require. X, a steel face, doom-tail into it; and which face may be taken out and changed, so as to suit different sized work and different operations.

Fig. 2, shews the action of a hammer-head, with a particular face doom-tail into it; and which face may be taken out and changed, so as to suit different sized work and different operations.

For the invention of this hammer Mr. Walby received, in 1805, the silver medal and forty guineas, from the Society for promoting Arts, Manufactures, and Commerce, in the Adelphi, London.

To HAMMER, v. o. To beat with a hammer. —His bones the hammer'd steel in strength surpass. Sandys. —To forge or form with a hammer:

Drudg'd like a smith, and on the anvil beat, 'Till he had hammer'd out a vast effate. Dryden.

To work in the mind, to contrive by intellectual labour: used commonly in contempt. —He was nobody that could not hammer out an invention, and picture it accordingly. Cowden.

Wilt thou still be hammering treachery, To humble down thy husband and thyself? Shakespeare.

To HAMMER, v. n. To work; to be busy; in contempt: Nor need'st thou much importune me to that, Whereupon this month I have been hammering. Shakespeare.

To be in agitation:

Vengeance is in my heart, death in my hand; Blood and revenge are hammering in my head. Shakespeare.

HAMMER, a town of Norway, in the diocese of Aggerhus: fifty-two miles north of Christiania.

HAMMER (Little), a town of Norway, in the diocese of Aggerhus: seventy-five miles north of Christiania.

HAMMER ISLAND, a small island of Sweden, in the Baltic, near the coast of Blekingen: four miles east of Carlston.

HAMMERER, f. He who works with a hammer.

HAMMERHARD, f. Hammerhard is when you harden iron or steel with much hammering on it. Moxon.

HAMMERHARDENED, a. Hardened by hammering.

HAMMERING, f. The art of working with a hammer; the act of forging with a hammer; the sound of hammers.

HAMMERHUS, a fortress of Denmark, in the island of Bornholm.

HAMMERSMITH, the most populous part of the little town of Fulham, near London. It has two excellent charity schools, and a fair on May 1st. It is situated on the north side of Thames, four miles west of London.

HAMMITES, f. In natural history, a flone resembling the sponge of Siphonella. Phillips.

Hammochry'sos, f. In natural history, a precious stone with spangles of a gold colour.

Hammock, f. [Hamaca, Sax.] A swinging bed.

Hammock, f. Prince Maurice of Nassau, who had been accustomed to hammocks, used them all his life. Temple.

Hammond, f. A city of Palestine, belonging to the tribe of Asher; situated upon the boundary of that province. Josh. xix. 28.

Hammond, or Hammath-dor, a city of Palestine, belonging to the tribe of Naphtali; and one of the cities of the Levites of the family of Gershon. It is probably the same with Hammath. Josh. xxii. 39. 1 Chron. vi. 76.

Hammond, Henry, a learned English divine, born at Chertsey in Surrey, in 1605. He was the youngest son of Dr. John Hammond, physician to Henry prince of Wales, who was his godfather. He received his classical education at Eton school, where he made a rapid proficiency in the Latin and Greek languages. In 1618, at the age of thirteen years of age, he was sent to Magdalen college, Oxford. In 1625 he was elected a fellow of his college, in which he had before been appointed

Vol. IX. No. 577.
to the office of lecturer in natural philosophy. He now began to apply with great diligence to the study of divinity; and in 1629 he entered into holy orders. In 1633, Dr. Freewen, who was then presiding of his college, and one of his majesty's chaplains, having appointed him to supply one of his turns at court, the earl of Leicester, who happened to be one of his auditors, was so much struck with his sermon, that he presented him to the rectory of Penhurst in Kent, which was then vacant, and in his patronage. In 1634 he proceeded bachelor in divinity; was admitted to the degree of doctor in that faculty by his majesty's chaplains, and in 1639 was chosen one of the members of the convocation. In 1643 he was made archdeacon of Chichester, by the unfavourable opinion of Dr. Duppa, then bishop of that diocese; and in the same year he was nominated one of the assembly of divines at Westminster, but never took his seat among them. Upon the commencement of the civil war between the king and parliament, Dr. Hammond having joined in a fruitless attempt that was then made at Tunbridge in favour of the king, and a reward of a hundred pounds being offered for his apprehension, he found it necessary to withdraw, and in 1629 he entered into holy orders. In 1633-4, Dr. Freewen, who was then president of his college, was much struck with his sermon, filled the place he had vacated, and in his patronage. In 1633-4 he proceeded to the study of divinity; was admitted to the degree of doctor in that faculty in 1638-9; and in 1640 was chosen one of the assistants to Dr. Steward, the clerk of the king's closet, who was the divine selected to be one of the king's communicators. In 1645, Dr. Hammond was presented by the king to a canonry of Christ-church, Oxford; and he was about the same time chosen public orator by the university. His majesty also appointed him one of his chaplains in ordinary. He attended the king's closet, and the earl of Southampton, who were sent to London by king Charles, with his answer to the propositions for peace, which had been tendered to him by the parliament. And when a treaty was held in the following month at Uxbridge, he was appointed one of the affiduus to Dr. Stewart, the clerk of the king's closet, who was the divine selected to be one of the king's communicators. In 1645, Dr. Hammond was presented by the king to a canonry of Christ-church, Oxford; and he was about the same time chosen public orator by the university. His majesty also appointed him one of his chaplains in ordinary. He attended the king's closet, and the earl of Southampton, who were sent to London by king Charles, with his answer to the propositions for peace, which had been tendered to him by the parliament. HAMOR, [Heb. an afs.] The name of a man.

HAMORPAI'CHAM, a town of Chinefe Tartary; forty-five miles east of Pimouat.

HAMOTDAR, [Heb.] The name of a city.

HAMPDEN (John), one of the most celebrated names among the opposers of arbitrary power, descended from an ancient family at Great Hampden in Buckinghamshire. He was born at London in 1594, and entered at an early age into the university at Magdalen college, Oxford. After an abode of three years in that university, he took chambers at one of the inns of court, and applied himself to the study of the law. He had made a considerable progress in his studies, when the death of his father prevented his further pursuit of the law, by putting him in possession of an ample fortune. He was consequently taken up by the mother of his kindred Oliver Cromwell, and joined the party in opposition to the court. He entered into public life in 1624, as a member of the second parliament under Charles I. About this time he married a lady of the family of Foley, the widow of E. Knightley, esq. of Northamptonshire. For some years, though in an unformed opinion of arbitrary power, he acted no very distinguished part in parliament. He was, however, one of those, who in 1637 had engaged a ship to convey them to New England, rather than submit to the payment of illegal taxes, or to the tyrannical proceedings of the bar-chamber and ecclesiastical courts. He first came into public notice by his repugnance to the uncivilized land of the New World; but it was not till after the declaration of the judges in favour of the king’s right to levy ship-money, that Hampden stood forward and refused the payment. He was prosecuted in the court of exchequer, and he himself, with his council, for twelve years together, argued the case against the crown lawyers before the twelve judges. It was decided against him by eight of the number; but the victory, in the popular opinion, was on his side; and his reputation was raised to such a height by this bold flight, that he thenceforth received the appellation of patriot Hampden; a title which, so far, feems generally to be admitted to have been his just due. His temper and modesty on this occasion did him as much credit as his firmness and perseverance. From this period he was a leading man in the great contest between the crown and the people; and, according to lord Clarendon, “his power and interest was greater to do good or hurt than any man’s in the kingdom, or than any man of his rank had in any time.” He was a member of the long parlament, and was appointed to watch the king’s proceedings in Scotland, and to treat on the part of the parliament with that nation. He was also of the committee for preparing the charge against lord Strafford, and arranging the evidence.

When a scheme took place for admitting some of the popular party into the ministry, the poll of preceptor to the young prince was designated for Hampden; which seems to prove that he was esteemed for his literary talents, as well as for the purity of his character. The intention was not brought to effect; the breach afterwards widened, and his parliamentary conduct became so obnoxious to Charles I. that he was one of the five members whom, in 1642, the king so imprudently caused to be accused of high-treason, and attempted to perfon to seize in the house. When the civil war unfortunately began, Hampden accepted the command of a regiment of foot in the parliament army under the earl of Essex; but his military career only permitted him to make a brief display of the same courage in the field which he had shewn in civil debate. Prince Rupert having attacked the quarters of the parliament troops near Thame in Oxfordshire, on June 18, 1643, Hampden eagerly joined a few cavalry who were rallied in haste, and proceeded to Chalgrove-field, where the enemy faced about. The rest of the officers would have waited for a reinforcement; but Hampden persuaded them to advance. In the skirmish that ensued, he received a shot in the shoulder which broke the bone; and although suffering extremely from the wound, he proved fatal on the 24th of that month. It is said that the king testified his respect for him, by sending his own physician to visit him, and offering the aid of his surgeons. In fact, it was the moral character of Hampden, and the undeviating resolution which marked all his actions, that placed him high in the estimation of opposition parties. When he had appealed to the laws of his country, he exposed himself to the fury of Charles and his minisiry, he violated no friendship, he transgressed no duty, public or private; and while he stood forth to defend the cause of liberty, he must have been sensible that his efforts, if ineffective, would soon be neglected and forgotten; and that however successful, they were left calculated to procure the applause of his contemporaries, than to extirpate the admiration and esteem of a grateful posterity: for from the exertions of this and other firm supporters of the true spirit of the British constitution, we are in a great measure indebted for the preservation and enjoyment of that freedom, which we now (be banished from most of the other countries of Europe. His death, however, proved at the time, a sub-

Shake-speare.—To complicate; to tangle; engage rising heats, these one by one unbend; stretch their small tubes, and hamper'd nerves unwind. Blackmore. To perplex; to embarrass by many lies and troubles; and when th' are hamper'd by the laws. Release the labours for the cause. HAMPERING, n. The act of bringing into perplexity; of putting in a hamper.

HAMPFLEIN, a town of Germany, in the archduchy of Austria: fourteen miles south-west of Stey.

HAMPShIRE, otherwise called The County of Hants, and County of Southampton, is a very opulent commercial and maritime county, bounded on the north by Berkshire, on the east by Surrey and Suffolk, on the south by the English Channel, and on the west by the counties of Wilts and Dorset. The air is healthy, and the soil in general fertile and productive, but various; a large proportion inclining to chalk, with a great quantity of fine sheep-down and rich meadows. Towards Berkshire, the exception of a small tract on the west, the land in general deep and good, producing great crops of corn. Towards Dorset, in the south-west part of the county, the land is open, and large tracts are covered with heath. The principal productions are corn, timber, and wool. The number of sheep in the county is estimated at 350,000. Hampshire is a very opulent commercial and island county, and the lords of the manors and lords of the manors are very large. The planting of hops has of late years increased in this county, principally on the borders of Surry; the great repute of the Farnham hops seems to have been the cause of this undertaking, which is likely to be very productive. Hampshire, during the Saxon heptarchy, belonged to the kingdom of Wessex; it is now included in the province of Canterbury, the diocese of Winchester, and the western circuit. Including the Isle of Wight, it is fifty-five miles long from north to south, forty miles broad from east to west, and two hundred and twenty in circumference. Its figure would be nearly square, were it not for a triangular projection on the south-west, which somewhat resembles the baflion of a fortification. It contains 1,450 square miles, or 9,560,000 square acres, including also the Isle of Wight; divided into 39 hundreds, having 250 parishes, 77 vicarages, and above 100 villages; with one city, Winchester, which sends two members to parliament, and gives the title of marquis to the Powell family; and twenty market towns, viz. Southampton, which sends two members to parliament, and gives the title of earl to the family of Wallop; Andover, which gives the title of viscount to the family of Wallop; and Southampton, the neighbourhood of Lymington and of Alton. It has besides several other inferior forests and chases; with a great number of parks and magnificent seats. Its chief product is corn, cattle, pastures, wood, iron, wool, fish, and hops. It is noted for its honey, and the best bacon in the kingdom. It has manufactories of woollen; and contains the most extensive magazine of naval stores at Portsmouth. The air of this county is reckoned extremely fertile and healthy, and abounds with extensive views and enchanting landscapes, particularly from Portsmouth, the neighbourhood of Lymington, and of Southampton, and from all the elevated points in the Isle of Wight, which have furnished inexhaustible materials to a number of poetical and prose writers.

HAMPShIRE, an extensive and wealthy county of
The American States, in Massachusetts, were led into a
Weft-Springfield, Northampton, Hadley, Hatfield, Deer
plate; but it raised so much envy against him, that, to
Patowmack, and its south branch. Iron ore and coals
mack river, which divides it from the State of Mary
luxuries, in great plenty.

Hampshire, a county of the American States, in
Virginia, bounded north and north-west by the Patow-
field, and Northfield. It is generally, of a fertile soil,
Worcester county, and west by Berkshire. It contains,
contains 7346 inhabitants. It is well watered by the
towns lie on both sides of Connecticut river, which in-
erfects it from north to south. These are Springfield,
Winicomet, and its south branch. Iron ore and coals
of muriat of magnesia, sulphate of lime,
cubic inches of carbonic acid gas, together with some
vegetables around. It has the advantage of a chalybeate
muriat of soda, and filex.

Hampstead, a populous and elegant village in
the county of Middlesex, situated on the declivity of a
fine hill, four miles from London. On the summit of
this hill is a heath, adorned with many spacious man-
mansions that might be termed palaces, and affording an ex-
tenive prospect over the metropolis, and into the coun-
ty of Essex, as well as the advantage of a chalybeate
spring of considerable efficacy. From the analysis of
this water recently made by J. Blifs, member of the
royal college of London, it was found to contain, in
every wine gallon, ½ grain of oxyd of iron, and 10½
pieces, 6 cc.

Hampstead, a populous and elegant village in
Hampshire county, New-Hampshire, about thirty-
north-east of Portsmouth. It was incorporated in
1745, and contained 768 inhabitants in 1790.

Hampstead, a town of the American States, on
Long Island, New-York, nine miles east-easterly of Jamaica,
and twenty-three miles easterly of New-York City.

Hampstead, a town of the American States, in
Georgia, about four miles from Savannah, and about a
mile from a village called Highgate, the inhabitants of
which are gardeners, and supply the town with vege-
tables in great plenty.

Hampston, a populous and elegant village nearly
adjoining to Kingston, in the county of Middlesex, near
which is the royal palace called Hampton-Court.

Hampton Court is a royal palace, situated on the
north bank of the Thames, two miles from Kinglon.
It was magnificently built with brick by cardinal Wof-
luy, who set up two hundred and eighty silk beds for
strangers only, and richly flored it with gold and silver
plate; but it raised too much envy against him, that, to
screen himself from its effects, he gave it to Henry VIII.
who, in return, suffered him to live in his palace at
Richmond. Henry greatly enlarged it, and it had then
five spacious courts adorned with buildings, which in
that age were greatly admired. Of the ancient splen-
dour of this palace we have few remains. The apart-
ments still standing, having been originally used merely
as domestic offices, can convey no idea of the times in
which they were built. The principal part of the old
palace was taken down in 1695; and the present struc-
ture was raised by king William, under the direction of
architect Wren. The grand facade towards the
garden extends three hundred and thirty feet, and that
towards the Thames three hundred and twenty-eight.
The portico and colonnade, of duplicated pillars of the
Ionic order, at the grand entrance, and indeed the gene-

cral design of these elevations, are in a superior style of
magnificence.

Hampton, a town of the American States, in
Hampshire county, Massachusetts; containing 457 inhabi-
tants, and situated 105 miles west of Boston.

Hampton (Eaft), a town of the American States, in
Winthrop county, Connecticut, three miles northeast of
Windham, of which it was formerly a parish, but

Hampton (Eaft), a township of the American States, in
Winthrop county, Connecticut; containing 457 inhabitants, and situated 105 miles west of Boston.

Hampton Falls, a small town taken from the
above town, lying on the road which leads from Ex-
eter to Newbury-Port, six miles south-easterly of the for-
mor, and eight north-westerly of the latter. It contained 615
inhabitants in 1790. It was incorporated in 1745.

Hampton, a township of the American States, in
the northern part of Washington county, New-York,
having Skeneborough on the west. It has 463 inhabi-
tants, of whom 107 are electors.

Hampton, a town of the American States, and
the capital of Elizabeth county, in Virginia, also a port of
entry and post-town, situated at the head of a bay
which runs up north from the mouth of James river,
called Hampton Road, five miles north-west of Point Com-
fort. It contains an episcopal church, a court-house,
and gaol. The value of its exports of grain, lumber,
flaves, &c. amounted to 41,997 dollars in one year, end-
ing September 30, 1794. This town was anciently call-
ed Reckonings by the Indians. It is sixteen miles north
of Norfolk, twenty-two south-east of York-Town, ninety-
three east-south-east of Richmond, and 205 west-south
of Philadelphia.

Hamrachi, a town of Persia, in the province of
Secchan; ninety-three leagues south-east of Zareng.

Ham'soca, f. In old records, the liberty of a man's
house.

Hamstring, f. The tendon of the ham.—On the
hinder side it is guarded with the two hamstring (Latin

Then Phalaris is added to his fide.

Ham'stringing, f. The act of cutting the tendon
of the ham.

Hamuel, [Hebrew.] A man's name.

Hamul, [Hebrew.] A man's name.

Hamulite, a descendant of Hamul.

Hamus, f. [Latin.] A hook; a surgeon's instru-
ment for extracting a dead child from the womb; a kind
of bandage. Phylaxis.

Ham'tatal, [Heb. the shadow of heat.] The name
of a woman.

Hamzagah, surnamed Ahdadi, and principal foun-
der of the Druses in Syria, propagated his doctrines at
Cairo, in Egypt, towards the commencement of the
eleventh century of the Christian era. He assumed the
character of high-priest and prophet of the religion of
the
and Engdilh broadcloths. It is difficult to palms along fatins, and other branches in the manufacture of filk, merchandize to and from the southerm provinces. The behind the counters. The flowered and embroidered posed to be not very much inferior to that of Peking, It miles oppofite the city. At low water there is a fine the richeft and pleafanteft cities of the empire, called province of Tche-kiang, and one of the province of Kiang-nan: twenty-five miles north-west of Tai-ping.

HAN-CHOO-FOO, a city of China, of the firft rank, and capital of the province of Tche-kiang, and one of the greatest and nobleft cities of the empire, called by the Chinese The Territorial Paradife, and laid to contain a million of souls. According to the account given by Sir George Staunton, Han-choo-foo is situated between the bafoon of the grand canal, and the river Chen-tang-chuang, which falls into the sea at the diftance of little more than fifty miles to the eastward. The tide, which increases the width of the river to about four miles opposite the city. At low water there is a fine level flrand near two miles broad, which extends towards the sea as far as the eye can reach. By this river, Han-choo-foo receives and exports great quantities of merchandise to and from the southerm provinces. The goods are flipped and unflipped by means of waggons with four wheels to each, placed in a line, and forming a convenient pier, which is easily lengthened or shortened, by increasing or diminishing the number of waggons, according to the diftance of the veffels from the flore. Between the river and the bafoon of the grand canal, there is no water communication. All the merchandise therefore brought by fea into the river from the southerm provinces, what comes from the lakes and rivers between the basin of the grand canal, and the river Chen-fi, on the river Han, in a fertile country, furrounded by mountains and forefts. The principal articles of commerce are honey, wax, mufk, and cinnabar. It is 625 miles north-west of Peking. Lat. 32. 59. N. lon. 122. 30. E. Ferro.

HAN-CHUEN, a town of China, of the third rank, in the province of Hou-quang, on the river Han: twenty-five miles weft of Han-yang.

HAN-YANG, a city of China, of the firft rank, in the province of Hou-quang, at the conflux of the rivers Han and Yang-tfe: 87 miles weft of Peking. Lat. 30. 36. N. lon. 131. 30. E. Ferro.

HAN-YN, a town of China, of the third rank, in the province of Chen-fi: thirty miles weft-north-weft of Hsing-kan.

HAN-YU, a town of China, of the third rank, in the province of Kiang-nan: twenty miles north of Htan.

HANAMEL, [Heb. the gift of God. ] The name of a man.

HANAMINE, a small ifland near the western coaft of Ireland, and county of Galway: two miles north-west of Rinveel Point.

HANANEEL, [Heb. grace. ] A man's name.

HANANI, [Heb. my grace. ] A man's name.

HANANI'AH, [Heb. the grace of God ] A man's name.

HANAPER, [Hanaperium, low Lat. ] A treasury.

HANAPER OFFICE, one of the offices belonging to the court of chancery. Writs relating to the bufinefs of the subject and their returns, were, according to the simplicity of ancient times, originally kept in a hamper, in hanaperio; and the others, relating to such matters wherein the crown is immediately or mediately concerned, were preferved in a little fack or bag, in parvd bagd; and thence hath arifen the distinctions of the hanaper and petty-bag office, which both belong to the common-law court in chancery. See the article CHANCERY, vol. iv. p. 87.

HANAU', a town of Germany, in the circle of the Upper Rhine, and capital of Hanau Munzenberg, on the Kinzig, where it joins the Main. It is divided into Old and New Town: the Old Town received its charter in 1393. The New Town was founded in 1597, by the Wallons, or Flemifh refugees, who were driven away by the cruelties of Philip II. king of Spain, and fettled here under the protection of the count of Hanau Munzenberg. Here are feveral churches; with manufactures of woollen, flilk, cotton, porcelain, &c. Great quantities of roll tobacco is made up here; but the greatest article of its trade consists of timber brought down the Main, rough and caft iron, meal, and corn. Every perfon has free liberty to trade as he pleafes. It is eight miles eafit of Frankfurt on the Maine, twenty-seven eafit of Mainz, and twenty five fourtli-south-east of Wetzlar. Lat. 50. 3. N. lon. 26. 30. E. Ferro.

HANAU' MUNZENBURG, a county and principality of Germany, situated principally on the Maine, between the electorate of Mainz, bishopric of Fulda, and principality of Helle Homburg, about fifteen leagues long, and five wide. It is esteemed one of the moft ter-
tile and rich counties in Germany, producing grain, legumes, exquisite wine, and delicious fruits. It contains magnificent forests, a rich falt-mines, a copper-mine, and a mine of coal. It was erected into a county in 1439. By the extinction of its hereditary title it fell by compact to the landgrave of Hesse Cauffel in 1736. Its assentment for a Roman month was 230 florins, and taxed to theamt of about 24,000 florins; and for every person 1 florin. HAN'COCK, a river of Washington island, on the north-west coast of North America, called 'Melfit' by the Indians, discovered by captain Crowell, in 1791. It empties into the sea from the north-end of the largest island. At its mouth it is nearly three nautical miles wide; and a considerable size ten miles up. It has at its mouth five fathom water, gradually increasing in depth from this point southward; and for several miles, to George Island, has not less than ten fathoms. Capt. Ingraham examined it about twelve miles; but by the information of the natives, he judged that it communicates with Skitti Bay, or near it, on the east side of the islands. It is by far the most eligible for a new settlement, of any place the captain had seen on the coast. The land around appears apparently very fertile; and the river abounds with salmon. Beautiful vales of grass occupy the skirts of the woods. The mouth of the river is in lat. 54° 7', N. long. 131° 54'. W. HAN'COCK HARBOUR, a harbour of North America, called by the Indians Coupous, situated about twenty leagues east-south-east of Nootka, in lat. 48° 30', N. long. 125° 36'. W. from Greenwich. The entrance is nearly five miles in length, and has good anchorage; about it are scattered a number of islands, and several land-banks or spits. It has also a number of fine coves. The land round the harbour is generally uneven, rocky, and mountainous; covered however with pine, fir, fyrnce, cedar, and other trees of a remarkable size. The climate is much milder than in the same latitude on the western side of the continent; the frost in winter being seldom so severe as to prevent vegetation. An easterly wind is considered here as a prognostic of a storm, and well winds bring fair weather. Deer, racoons, wolves, bears, squirrels, martins, land-otters, beaver, and wildcats, are the animals which inhabit the forests. The amphibious animals are the common seal and the sea-otter. The skin of the latter is very valuable. The inhabitants are said to be cannibals. This and other places of the same name have their appellation in honour of the late governor Hancock, of Massachusetts. HAN'COCK, a township of the American States, in Addison county, Vermont. HAN'COCK, a township of the American States, in Lincoln county, Maine, embofmed by the Kennebeck and Sebalticook rivers, bounded north-west by Canada, and seven miles north of the confluence of the two rivers. It contains 275 inhabitants. HAN'COCK, a township of the American States, in Hillsborough county, New Hampshire, situated between two western branches of Contoocook river, fourteen miles east of Keene, and between fifty and seventy west-by-south of Portsmouth. It was incorporated in 1779, and contains 634 inhabitants. HAN'COCK, a long, narrow, and mountainous, township, ship of the American States, on the New-York line, in Berkshire county, Massachusetts, having the towns of Lunenburg and Partridgefield on the northward, and Pittsfield on the south. It was incorporated in 1776, has 1231 inhabitants, and lies twenty miles north-by-west of Lenox, and 150 west of Boston. HAN'COCK, a part-town of the American States, in Maryland, situated in Washington county, on the north bank of Patowmac river, between Conolwy and Little Conolwy creeks, about twenty-five miles south-east of Bedford in Pennsylvania, thirty-four north-east of Old Town in Maryland, and 119 north-west of Baltimore. HAN'COCK, a new county of the American States, in the upper district of Georgia.
Out of them you dare take in hand to lay open the original of such a nation. *Spenser on Ireland.*—Manner of gathering or taking.—As her majesty hath received great profit, so may else, by a moderate hand, from time to time, to be done, as like. *Bacon.*—Working in a hand; power or act of manufacturing or making.—An intelligent being, coming out of the hands of infinite perfection, with an aversion to be reunited with its Author, the source of its utmost felicity, is such a deformity in the beautiful analogy of things, as is not consistent with finite wisdom and perfection. *Chapman.*—Manner of acting or performing:

The master saw the madness rise; his glistening checks, his ardent eyes; and while he heav'n and earth defy'd, Chang'd his hand and check'd his pride. *Dryden.*

Agency; part in action.—God must have set a more than ordinary esteem upon that which David was not thought fit to have an hand in. *South.*—The act of giving or pretenting.—Let Tamar drefs the meat in my hand, that I may eat it at her hand. *Sam. xiii. 5.*

To-night the poet's advocate I stand, and he deferves the favour at my hand. *Addison.*

Act of receiving any thing ready at one's hand, when it only waits to be taken.—His power reaches no farther than to compound and divide the materials that are mingled together; but can do nothing towards the making or destroying one atom of what is already in being. *Locke.*—Care; necessity of managing:

When a flatetman wants a day's defence, Or envy holds a whole week's war with fenfe, Or simple pride for flatt'ry makes demands, May duns by duns be whittled off my hands. *Pope.*

Discharge of duty.—Let it therefore be required, on both parts, at the hands of the clergy, to be in meanest of estate like the apostles; at the hands of the laity, to be as they who lived under the apostles. *Hooker.*—Reach; nearness: as, at hand, within reach, near, approaching.—Any light thing that moveth, when we find no wind, throweth a wind at hand. *Bacon.*

Cousins, I hope the days are near at hand; That chambers will be safe. *Shakespeare.*

Mutual management:

Nor swords at hand, nor hilling darts afar, Are doon'd to t'ave the tedious bloody war. *Dryden.*

State of being in preparation:

Where is our usual manager of mirth? Is there no play, to amuse us, and make even at the year's end. *Shakespeare.*

In single opposition hand to hand, He did confound the best part of an hour. *Shakespeare.*

Hand in Hand. In union; conjointly.—Had the sea been Marlborough's element, the war had been bestowed there, to the advantage of the country, which would then have gone hand in hand with his own. *Swift.*—Fit; pat.—As fair and as good, a kind of hand in hand comparison, had been something too fair and too good for any lady in Britain. *Shakespeare.*

Hand to Mouth. AS want requires.—I can get bread from hand to mouth, and make even at the year's end. *L'Estrange.*

Hand in hand. To keep in expectation; to cluse. —A rafely yeed-tooth knave, to bear in hand, and then stand upon security. *Shakespeare.*

To be Hand and Glove. To be intimate and familiar; to fuit one another.

To HAND, p. a. To give or tranfmit with the hand. —I have been fown a written prophecy that is handed among them with great secrecy. *Addison.*—To guide or lead by the hand.—By safe and inoffensive degrees he will pass from a boy to a man, which is the most hazardous
ardous life: this therefore should be carefully watched, and a young man with great diligence hand over it. Locke.—To seize; to lay hands on:
Let him, that makes but trifles of his eyes,
First hand me.
Shakespeare.

To manage; to move with the hand:
'Tis then that with delight Irove,
Upon the boundles depth of love;
I blest my chains, I hand my oar,
Nor think on all I left on shore.
Prior.

To tranmit in succussion, with down; to deliver from one to another.—Arts and sciences confiilt of scattered theores, which are handed about among the masters, and only revealed to the filius artis, till once great genius appears, who collects these disjointed pro-
positions, and reduces them into a regular sytem. Ar-
buthnot. —One would think a story fo fit for age to talk of, and infancy to hear, were incapable of being handed down to us. Pope.

HAND is much used in composition for that which is manageable by the hand, as a hand-faw; or borne in the hand, as a hand-barrow.

HAND-BALL. See the article Tennis.

HAND-BARROW, f. A frame on which any thing is carried by hands of two men, without wheeling on the ground.—Set the board whereon the horse runs, with a hand-barrow, and carry them to the place you intend. Mortimer.

HAND-BASKET, f. A portable basket.—You must have woolen yarn to tie grafts with, and a small hand-basket to carry them in. Mortimer.

HAND-BELL, f. A bell rung by the hand.—The strength of the percussion is the principal cause of the loudnefs or softnefs of sounds, as in ringing of a hand-bell; harder or softer. Bacon.

Hand-bells, which first appeared in religious procefsions, were afterwards used by bell-ringers for the fake of patience. Ten or twelve bells are frequently rung in rounds, or changes, by a company of ringers, sometimes one to each bell, but more usually every ringer has two. A blind man, who fits in the ftreets of London, rings twelve bells at one time: two of them are placed upon his head; two in each hand; one affixed to each of his knees; and two upon each foot; all of which he manages with great adroitness, and performs a variety of tunes.

Eley.

The edifice with which woodmen perform their work, in cutting underwood, &c.

HAND-BREADTH, f. A space equal to the breadth of the hand; a palm.—The caufer people determined their hand-breadths by the breadth of barley-corns, fix making a digit, and twenty-four a hand-breath. Arbuthnot.

HAND-CUFF, f. An iron instrument to confine the hand.

To HAND-CUFF, v. t. To confine the hands by an iron instrument.

HAND-GALLOP, f. A flow and easy gallop, in which the horse paces the biddle and more increafed speed.—Ovid, with all his sweetnefs, has as little variety which the hand prefles the bridle to hinder increafe of iron in illruuent.

HAND-GRIP, f. A hand-grip.

HAND-GUN, f. A short gun.—Guns have names given them, none from ferpents or ravenous birds, as culverines or culbrius; others in other refeptes, as cannons, demicannons, hand-guns, and mutkets. Condor.

HAND-HABEND, f. A thief caught in the very fa&,
That you beat me at the mart, I have your hand to show.
Writings. Cockburn.

If the skin were parchment, and the blows you gave me hand, your own hand-writing would tell you what I think. Shaks. 

HANDED, adj. Having the use of the hand, left or right.—Many are right handed, whose livers are weakly constituted: and many use the left, in whom that part is strongest. Brown.—With hands joined:
Into their immot bow'r Handed they went.

HANDEL (George-Frederic), a moft admirable composer and master of music, born at Halle, in Upper Saxony, in 1684. His father was a phyfician in that city, and had this fon by a second wife. From his earliest childhood he discovered such an irresistible pro-
nenity to music, that his father, who intended him for the civil law, was much vexed at it, and removed all musical instruments out of his way; yet so great was the child's ruling passion for the charms of melody, that, before he had reached the age of seven, he contrived to get a small clavichord conveyed to the top of the house, which he constantly amused himself when the family were retired to reft. It happened about this time that he accompanied his father on a visit to a fon by the firft marriage, who was valet to the duke of Saxe-Weif-
felns. On this occasion, young Handel could not forbear touching every harpichord he met with: and one morning, fealing into the organ-loft of the chapel, he began to play on it while the duke was within hearing. Struck with an unusual faund, he asked his valet what stranger was playing; and, on being told it was his brother, he commanded the boy to be brought before him, and the father also to be ferr for. The reafon of the duke's enquiries was a recommendation that such a native genius should by no mean be buried; for he could fafely hand over him every means of encourage-
mant. Upon his return to Halle, Handel was placed with Zachau, organift of the cathedral, by whom he was taught the principles of music, and introduced to the works of the great composers. He improved fo rapidly, that at the age of nine he composed motets for the favice of the church. When he was thirteen, he found that Halle offered him no farther opportunity of improvement, and therefore visited Berlin, where the opera was then flourifhing under Buononcini and Attilio. He there attrafled the notice of the king, who expressed an intention of sending him to Italy, where he might be formed under the bent masters; but his friends had reafon of declining the offer. He next visited Hamburg; and, losing his father about this time, he took a place
hand and arm, and had fits of alternate desolation and irritation which amounted almost to a degree of phrenzy. The use of the baths of Aix-la-Chapelle, however, entirely
and, as an encouragement, settled upon him for life a pension of 200l. per annum. All this made Handel forget his obligations at Hanover; so that when his majesty George I. came over, on the death of queen Anne, in 1714, conscious how ill he had deferved at his hands, he durst not appear at court. It happened, however, that his noble friend baron Kilmansegge was here; and he, with others of the nobility, convinced the following scheme for reinstating him in his majesty's favour. The king was persuaded to form a party on the water; and Handel was directed to prepare some music for the occasion. This gave birth to his beloved admirers*. "Water-piece." It was performed and conducted by himself, unknown to his majesty, whose pleasure, on hearing it, was equal to his surprize. Upon enquiring who it was, the baron produced the delinquent, and presented him to the king, as one that was too conscious of his fault to attempt an excuse for it. Thus Handel was restored to favour, and his music honoured with the highest approbation; and, as a token of it, the king was pleased to add a pension for life of 200l. a-year to that which queen Anne had before given him.

Handel was now settled in England upon a permanent establishment; and his reputation doubly unvaried. During the three first years of his time he was principally engaged at the court of the earl of Burlington, in Piccadilly, where he frequently met Pope. The poet one day asked his friend Arbuthnot, of whose knowledge in music he was so much possessed, whether he could pronounce that his real opinion of Handel as a musician? who replied, "Conceive the highest you can of his abilities, and they are much beyond anything that you can conceive." Pope nevertheless declared, that Handel's finest performances gave him more pleasure than the airs of a common ballad: so ill-adapted was the ear of our sublime poet to the melody of Handel! The two next years he spent in the magnificent James, first duke of Chandos, at his noble seat at Cannons, for the purpose of directing the chapel service; for particulars of which see vol. vi. p. 245.—While he was thus employed at Cannons, a project was formed by the nobility for erecting an academy in the Haymarket; the intention of which was to secure a constant supply of operas, to be composed by Handel, and to be performed under his direction. For this purpose a fund of 50,000l. was subscribed; and Handel went to Dresden in quest of singers, whence he brought Senecino, and Durante. At this time Buononcini and Attilio composed for the opera, and had a strong party in their favour. A violent quarrel took place between them, and at last the parties were all united, and each undertook his particular part. The application of Handel was thus firmly established, and Handel appointed director of it, all things went on prosperously for a couple of near ten years. At length a quarrel took place between Handel and Senecino, which the mediation of the nobility was unable to reconcile. This was followed by a fierce dispute between the two female singers, Faustina and Cuzzoni, which the whole body of musical amateurs into parties, and exposed them to ridicule. These dissensions broke up the academy; and while Handel, continuing at the Haymarket, endeavoured to support himself by new compositions and performers, the offended nobility set up a rival opera-house in Lincoln's-in-fields, which had the aid of Porpora's compositions, and of Farinelli's inimitable vocal powers. Handel was now fairly beat out of the Haymarket, and made an engagement with Rich at Covent-garden. There he continued an unequal contest with an obbligato that greatly injured his fortune, and gave so much exercise to his patience. The loss of his fortune, however, became impaired. He was affected with a palsy of the right hand and arm, and had fits of alternate dejection and irritation which amounted almost to a degree of phrenzy. The use of the baths of Aix-la-Chapelle, however, entirely

The use of the baths of Aix-la-Chapelle, however, entirely
Handel.

He was honourably received in Dublin, where he judiciously commenced with performing his Messiah for the benefit of the city-prison; a charity greatly praised, but much more sensibly felt. After an absence of nine months, he returned to London, and entertained the town with an oratorio from Samson Agonistes. He continued, not withstanding some opposition, to gain in the public esteem, and had the satisfaction of seeing his Messiah established as the sublimest effort of musical conceptions of his genius, and of the extent and fertility of his resources. As a specimen of the high character of the fyle of his opera songs, we shall give the description in the words of his able and judicious biographer Dr. Burney,—"The first movement of Handel's overture of Rinaldo, is grand and majestic. The introductory air Sorge nelfpetto, sung by signora Bofchi, abounds with many graceful and pleasing passages. The next air, sung by Isabella Girardeau, is spirited, ingeniously accompanied, and new. The first air which Bofchi sings is a rough daffance, fit for a pagan and a base voice. The next air, sung by his wife, is spirited and pleasing. Then follows Vieno o cara, which is very characteristic, and, though a jig, and for a base voice, not vulgar. Furti terribile, an air for Armida, is full of genius and fire, and truly dramatic. Angelotti che cantate, is charming; there is a soothing passage in it which he afterwards used in "Return O God of hosts." The duet, Scherzana fai tuo velto, has in it many pretty passages, though the plan is not dramatic, nor is it formed on the old plan, as many duets he afterwards composed. Cara ffoja is one of the best airs in that style that was ever composed by himself or any other master; and by many degrees the most pathetic song, and with the richest accompaniment, which had been then heard in England. The last air in the first act, Vesti turbata, is a capital bravura, calculated to display Nicolini's powers of execution and acting. The first air in the second act, Siam profami, is pleasing, in the favourite fyle of Carissimi, about the middle of the last century. The Siren's song is an agreeable Siciliana in Handel's own favourite fyle. Il tricicbro humilis, a passionate air for Nicolini, in which all the parts play in union and octave to the right, on which Nicolini, with all his boldness and facility, had sung English Bachi- channelian words set to it, "Let the waiter bring clean glaftes," to which it was long sung at merry and convivial meetings all over the kingdom. Scorta rea, is an agreeable air in two parts, fugato. Mio cor, another spirited air, with no other accompaniment than a base, but it is an admirable song. Belto elet tu cieha, is an excellent base fong of an original cast and accompaniment. Fermata, a duet of infinite genius, spirit, and originality; in which much that modern duets are all cast in the same mould. Ah crudel! the whole opening and conduct of this admirable adagio may be found in the author's hautbois concertos. Vò far guerra, with an accompaniment for the harpsichord which terminates the second act, and which Handel played himself during the run of the opera, must have captivated the audience by the lightness and elasticity of his finger; as it contains no one learned or solid passage. However, he afterwards drew from the brilliant parts passages for his harpsichord lessons and other concertos. The second air in the third act, Sorge nel petto, is a soothing and pathetic morcel. The next, E un inciudio, is spirited and pleasing. The violin part reminds us of the accompaniment to a movement in the coruscation anthem. Al triefo, a duo, which is good music; but the passages all occur in subfrequent compositions by our author.
author, particularly in the accomplishment, where we hear the gavot of Otho. *Bel canto,* is a light natural air, wholly unaccompanied even by a bafe. If the singer, Isabella Girardeau, had a remarkable fine, melodic, and steady, voice, it was giving it a fair hearing in all its purity; which would please natural ears more than those that are depraved, in the language of Raffi. *Requiem.* Nor la tromba, is an excellent air of spirit for Niedrini, with a trumpet accompaniment, and bold and new effects. The last chorus is an agreeable gavot, like that in the overture to *Paffor fido,* and like many other movements in Handel's subsequent works. But no one of them requires us to mount up to the time in which it was composed so much as "Rinaldo," in the presence of their majesties, and the mod august personages of the court, a strong spirit of independence, which Handel inherited from his childhood, of the genius which has been not only palliah glaring by others, but by himself. It is, however, for too few in comparison to any of that period which had ever been performed in England, that its great success does honour to our nation. —Such is rated to be the merit of his first opera; and such has been the captivating effect of most of his subsequent ones, Radaunilo, Allemandro, Adriano, Deidamia, as prove them to be compositions of no ordinary cast.

Thee who think order and regularity incompatible with genius, will be surprized at the minute exactness with which this great man conducted all his affairs. That love of regularity and order, which enabled him to give to the world so many astonishing proofs of genius and invention, has never quitted him, in hurry, in perturbation. The last opera which he composed was *Deidamia,* in 1740; but though fast, not leaf. And when it is recollected that, exclusive of the operas which he had set in Germany and Italy, before his arrival in London, this was the thirty-ninth Italian drama which he had composed for the English stage, the fertility and vigour of his invention must appear astonishing! The airs in this last opera of Deidamia are as much contrived in style, design, and passages, as those he composed thirty years before; and in this particular, Handel's resources seem superior to those of any voluminous opera-composer whatsoever. After this period, having no concern in the composition or management of Italian operas, he never set any other words than English, and those were wholly confined to sacred subjects. He inherited, from his childhood, a strong spirit of independence, which was never known to forfake him in the most diftrefles feasons of his life: and it is remarkable, that he refrained the greatest offers from persons of the first distinction, nay, and even the highest favours from the fairest of the fair; that acquaintance he would not be cramped or confined by particular attachments. A very honourable national testimony of applause to the genius of Handel was given in 1784, by a commemoration at Westminster-abbey, consisting of the performance of pieces, selected from his works, by a band of more than five hundred voices and instruments, in the presence of their majesties, and the noblest personages in the kingdom. These were continued for several successive years, and applied to charitable purposes. His oratorios are still annually performed in Lent at the theatres, and make a part of all the great musical celebrations in different parts of the kingdom.

**HANDELING, f.** Dexterity: The heavens and your faire handeling Have made you master of the field this day. *Spenser.*

**HANDER, f.** Traufmitter; conveyer in succession: They would affume, with wondrous art, Themselves to be the whole who are but part, Of that vast frame the church: yet grant they were The handers down, can they from thence infer A right to interpret: or would they alone, Who brought the present, claim it for their own? *Dryden.*

**HANDEFAST, v. a.** To join two persons by joining their hands. —Aunspices were those that handeled the married couple, *Whalley's Note to B. Jonfon's Molke.*

**HANDFUL, f.** As much as the hand can grasp or contain: —I saw a country gentleman at the side of Rofemond's pond, pulling a handful of oats out of his pocket, and gathering the ducks about him. *Addison.* A palm; a hand's breadth; four inches. —Take one veoffel of silver and another of wood, each full of water, and knap the tongs together about an handful from the bottom, and the sound will be more retounding from the veoffel of silver than that of wood. *Bacon.*

The peaceful scabbard where it dwelt, The rancour of its edge had felt; For of the lower end two handful It had devoured, it was so manfull. *Hudibras.*

A small number or quantity. —He could not, with such a handful of men, and without cannon, propose reasonably to fight a battle. *Clarendon.* —As much as can be done. —Being in possession of the town, they had their handful to defend themselves from firing. *Raleigh.*

**HANDGRITH, f.** [Hom. Saxon, and grith, pos.] Peace or protection given by the king with his own hand. *Leg. Hen. I.*

**HANDICRAFT, f.** Manual occupation; work performed by the hand. —Particular members of convents have excellent mechanical genius, and divert themselves with painting, sculpture, architecture, gardening, and several kinds of handicrafts. *Addison.* A man who lives by manual labour: The cov'nants thou shalt teach by candle-light, When puffing smiths, and ev'ry painful trade Of handicrafts, in peaceful beds are laid. *Dryden.*

**HANDICRAFT, adj.** Belonging to a trade that requires art and manual labour. *Handicraftsman, f.* A manufacturer; one employed in manual labor. —The principal bulk of the natives are tillers of the ground, free servants, and handicraftsman; as smiths, masons, and carpenters. *Bacon.* —It is the landed man that maintains the merchant and shopkeeper, and handicraftsman. *South.*

**HANDILY, adv.** With skill; with dexterity. *Handiness, f.** Readiness; dexterity. *Handing, f.* The act of leading by the hand; of conveying by the hand. *Handiwork, f.* Work of the hand; product of labour; manufacture. —The heavens declare the glory of God, and the firmament sheweth his handicraft. *Psalm.*

**HANDKERCHER, f.** A corruption of handkerchief: Handles no point so evident and clear, (Besides his white gloves) as his handkercher. *Butler.*

**HANDKERCHER, f.** A piece of silk or linen us'd to wipe the face or cover the neck. —A nun who dresses herself with painting, sculpture, architecture, gardening, —It is the landed man that maintains the merchant and shopkeeper, and handicraftsman. *Handliwork.* *Psalm.*

**HANDLE, v. a.** [Handelen, Dut. from hand.] To touch; to feel with the hand. —The bodies which we daily handle, make us perceive, that whilst they remain between them, they hinder the approach of the part of our hands that press them. *Ulysses.* —To manage; to wield. —That fellow handles his bow like a crowkeeper. *Shakespeare.* —To make familiar to the hand by frequent touch. —An incurable blindness is the general vice of the Irish and English, and the handkerchief, and shopkeeper, and handicraftsman. *South.*
To praise upon; to transact with.—Pray you, my lord, give me leave to question; you shall see how I'll handle her. Shakespeare.

HANDLE, [f. [handle, Sax.] That part of anything by which it is held in the hand; a haft.—Fortune turns the handle of the bottle, which is easy to be taken hold of; and after the belly, which is hard to grasp. Bacon.—There is nothing but hath a double handle, or at least we have two hands to apprehend it. Taylor.

Of bone the handles of my knives are made, Yet no ill taste from thence affects the blade. Dryden.

That of which use is made.—They overturned him in all his interests by the false but fatal handle of his own good nature. Smollett.

HANDLESS, adj. Without a hand:
Speak, my Lavinia, what accursed hand Hath made thee handlest? Shakespeare.

HANDLING, f. The act of feeling or touching with the hand; the manner in which any subject is treated.

HANDMAID, f. A maid that waits at hand.—Since he had placed his heart upon wisdom; health, wealth, victory, and honour, should always wait on her as her handmaids. Addison.

By viewing nature, nature's handmaid, Art,
Makes mighty things from small beginnings grow; Thus filhes first to shipping did impart,
Their tail the rudder, and their head the prow. Dryden.

Then criticifm the muse's handmaid prov'd,
To drefs her charms and make her more belov'd. Pope.

HANDMAIDEN, f. Handmaid.—For he hath regarded the low estate of his handmaidens. Luke i. 48.

HANDS, f. [because both hands hold the bat.] An inning at cricket. Mason's Sapph. to Johnson.

HANDS OFF'. A vulgar phrase for keep off; forbear. They cut a flag into parts; but as they were entering upon the dividend, hands off, says the lion. Dryden.

HANDSE, [f. [handel, D ut. a first gift.] The first act of using any thing; the first act of sale. It is not used, except in the dialect of trade.—The apostles term it the pledge of our inheritance, and the handel or earnest of that which is to come. Hooker.

Thou art joy's handel; heav'n lies flat on thee,
Subject to every mounter's bended knee. Herbert.

To HANDSE, v. o. To use or do any thing the first time:
In timorous deer he handels his young paws,
And leaves the rugged bear for firmer claws. Cowley.

HANDSOME, adj. [handfarm, Dut. ready, dexterous.] Ready; gainly; convenient.—For a thief it is to handle, as it may feem it was first invented for him. Spenser.

—Beautiful, with dignity: graceful.—A man entered by force into a peafant's houfe, and, finding his wife very handsome, turned the good man out of his dwelling, gracefull; graceful.—That earnefs and handsomenefl, addrefs in writing, is hardest to be attained by persons bred in a manner way. Felton.—A mple; liberal; as, a handsome fortune. Generous; noble; as, a handsome action.

Handsome, v. a. To render elegant or neat:
Handsome, v. a. To render elegant or neat:

Him all repute For his device in handling a suit; To judge of lace he had the bell conceit. Donne.

HANDSOMELY, adv. Convenienly; dexterously; When the kind nymph, changing her faultless shape,
Becomes unhandfome, handsomenelv to escape. Waller.

Beautifully; gracefully; elegantly; neatly.—A carpenter, after he hath fawn down a tree, hath wrought it handsomely and made a valuable cerc. Wiffon.—Liberally;

N Honor.—I am finding out a convenient place for an almihoufe, which I intend to endow very handsomely for a dozen supernumerary husbandmen. Addison.

HANDSOMENESS, f. Beauty; grace; elegance.—Accompanying her mourning garments with a doleful countenance, yet neither forgetting handsomeneff in mourning garments, nor sweetnefs in her doleful countenance. Smollett.

HANDSPIKE, or HANDSPE, f. A lever, usuall'y of wood, for raising great weights by the hand. It is five or fix feet long, cut thin at the lower end, that it may get the eafier between things that are to be separated, or under any weight that is to be raised. It is much superior to a crow of iron, because its length allows a better poife. Dryden.

HANDY, adj. Executed or performed by the hand:
Both parties now were drawn to close,
Almof to come to handly blows. Dryden.

Ready dexterous, skillful:
She shripst the flanks of all their leaves; the best She cul'd, and them with handy care the dret. Dryden.

Handy; ready to the hand.—The strike-block is a plane shorter than the jointer, and is more handy than the long jointer, Mosqueros.

HANDY-DANDY, f. A play in which children change hands and places.—See how yond justice riles upon yond simple thief! Hark in thine ear: change places; and handy-dandy, which is the justice, which is the thief? Shakespeare.

HANDYWARE, f. In commerce, a kind of cloth. Plllips.

HANDYWORK, f. See HANDIWORK.

HANEOY'E, a small lake of United America, in the state of New York: twenty-six miles south of Lake Ontario.

HANGEA, f. A corn-meafure in Bilboa in Spain, three-fifths of an English bushel.

HANES, the name of a city of Egypt. Yisaah xxx. 4.
HANG, f. [a phrase with landscape gardeners.] A sharp declivity.

To HANG, v. a. Preter, and part, paffed, hanged or hung, anciently hung: [hang'd, Sax.] To suspend; to let fall below the proper situation; to de¬

Hang the thief in thine ear: change places; and handy-dandy, which is the justice, which is the thief? Shakespeare.

Strangely visited people he cures;
Handing a golden lamp about their necks,
Put on with holy prayers. Shakespeare.

To place without any solid support:
Thou all things half of nothing made,
That hang'd the solid earth in fleeting air,
Vein'd with clear springs, which ambient seas repair. Sandy.

To choak and kill by suspending by the neck, fo as that the ligature intercepts the breath and circulation:
Handing luppofes human soul and reafon;
This animal's below committing treafon;
Shall he be hang'd, who never could rebel?
That's a preference for Architetel. Dryden.

To display; to show aloft.—This unlucky mole mill'd several coxcombs; like the hanging out of falle colours. Addison.—To let fall below the proper fituation; to de¬

Thus fillies firft to (hipping did impart,
To hang, v. a. Preter, and part, past, hanged or hung, anciently hung; [hang'd, Sax.] To suspend; to let fall below the proper situation; to de¬

Hang the thief in thine ear: change places; and handy-dandy, which is the justice, which is the thief? Shakespeare.

Sandy.

To choak and kill by suspending by the neck, so as that the ligature intercepts the breath and circulation:

Handing luppofes human soul and reafon;
This animal's below committing treafon;
Shall he be hang'd, who never could rebel?
That's a preference for Architetel. Dryden.

To display; to show aloft.—This unlucky mole mill'd several coxcombs; like the hanging out of falle colours. Addison.—To let fall below the proper fituation; to de¬

Hang the thief in thine ear: change places; and handy-dandy, which is the justice, which is the thief? Shakespeare.

That's a preference for Architetel. Dryden.

To display; to show aloft.—This unlucky mole mill'd several coxcombs; like the hanging out of falle colours. Addison.—To let fall below the proper fituation; to de¬
charge by any thing suspended.—**HANG** be the heaviest with black, yield day to night! **Shakespeare.**

The pavement ever foul with human gore;
Heads and their mangled members hung, above, not below:
With comely compass and compasfure strong. **Spenser.**

To bend forward.—**HANG**"—To bend forward to strike the enemy.

If gaming does an aged life entice,
To have a deep declivity.**Swift.**

But 210 H A N
could not the heavens be the door.

Skahefpeare.

Sir Roger has hung several parts of his house with the trophies of his labours.

Over it a fair portcullis hung. Bacon.—

The pavement ever foul with human gore;

To bend forward.—**Hang**"—To bend forward to strike the enemy.

Gardens such as are planted on the top;

Addison.

Where civil speech and soft perfuasion hang up, not below:

To bend forward.—**Hang**"—To bend forward to strike the enemy.

Though wand'ring senates and unequal courts, of the house.

Addison.

'And left me bare to weather. **Shakespeare.**

Not in use: Any thing that hangs to another.

Hard words or hang together. If your judge be Page.

Death by a halter:—Surely, sir, a good favour you have; but that you have a hanging look. **Shakespeare.**

What Ethiops lips he has! BAILEY.

How full a snout, and what a hanging, nay my leaves, and let me bare to weather. **Shakespeare.**

Die by a halter:—Surely, sir, a good favour you have; but that you have a hanging look. **Shakespeare.**

A term of reproach, either serious or ludicrous. He hath twice or thrice cut Cupid's bowstring, and the little hanging-mane dare not shoot at him. **Shakespeare.**

One cried God bless us! and Amen! the other:—Your friend, sir, the hangman.**Shakespeare.**

Who makes that noise there? who are you? —Your friend, sir, the hangman.**Shakespeare.**

A term of reproach, either serious or ludicrous. He hath twice or thrice cut Cupid's bowstring, and the little hanging-mane dare not shoot at him. **Shakespeare.**

One cried God bless us! and Amen the other; as they had seen me with these hanging-man's hands: **Shakespeare.**

And the middle of the sides of hanging grounds. **Mortimer.**

To be executed by the halter. —The court forfakes him and sir Balseam hangs. Pope. —To declare; to bend down; his neck obliquely over his shoulders hung,

Presa'd with the weight of sleep that takes the strong. Pope.

**HANG**, a town of Sweden, in the province of East Gothland: six miles north-east of Linkoping.

**HANG-WITE, or HANG-WIT, f. [hangan, Sax. i. e. suspendere, and price, wulida.] A liberty formerly granted to a person, whereby he is quit of a felon or thief hanged without judgment, or escaped out of custody. Regal. And it may signify a liberty, whereby a lord challenges the forfeiture for him who hangs himself within the lord's fee. **Downdy.**

**HANGCLIFF,** a remarkable point of land on the east coast of the largest of the Shetland Islands. It is frequently the first land seen by ships in northern voyages. Lat. 65. 9. N. Ion. 56. 30. W.

**HANGER,** f. That by which anything hangs; as, the pot hanger.

**HANGER,** f. A short broad sword, inquired towards the point. —I clothed myself in my best apparel, girded on my hanger, stuck my pitiold loaded in my belt. Smollet.

**HANGER-ON,** f. A dependant, one who eats and drinks without payment. —He is a perpetual hanger-on, yet nobody knows how to be without him. Swift.

**HANGEST,** a town of France, in the department of the Somme, and chief place of a canton, in the district of Montdidier: two leagues and a half north of Montdidier.

**HANGING,** f. The act of fixing any thing so as not to reft on the ground. The act of putting to death by the halter. That which is hung up for ornament; drapery fastened against the walls of a room for ornament:

Now purple hangings cloath the palace walls, and sumptuous acifs are made in splendid halls. Dryden.

Any thing that hangs to another. 

**HANGING, part. adj.** Foreboding death by the halter,--Surely, sir, a good favour you have; but that you have a hanging look. **Shakespeare.**

What Athiops lips he has!

How full a snout, and what a hanging face! **Dryden.**

Requiring to be punished by the halter; a hanging matter. **HANGING-PEAR,** f. A kind of pear which ripens about the end of September. **Bailey.**

**HANGING-SHAW-FLAW,** a hill of Scotland, in the county of Selkirk: four miles and a half north-west of Selkirk.

**HANGING-SLEEVES,** f. Two stripes of the same stuff with a girl's gown, which, hanging down the back from the shoulders, used to be worn by girls under twelve years old. —These muffafoes are to be left off with your hanging-sleeves. **Marp. of Halifax.**

**HANG-MAN,** f. The public executioner. —The hangman is generally a worse malefactor than the criminal that suffers by his hand. **Addison.**

Who makes that noise there? who are you? —Your friend, sir, the hangman. **Shakespeare.**

A term of reproach, either serious or ludicrous. He hath twice or thrice cut Cupid's bowstring, and the little hanging-mane dare not shoot at him. **Shakespeare.**

One cried God bless us! and Amen the other; as they had seen me with these hanging-man's hands: **Shakespeare.**

Lif'ning
The text appears to be a historical or biographical account, mentioning various individuals and places. It includes details about various individuals such as HANNEKEN (Philip-Louis), a son of the preceding, born at Marburg in 1637. It also mentions different works and events such as the publication of *De Byzantinarum rerum Scriptoribus*, 4to. 1669, 1675. The text seems to be a continuation of a series of biographies or historical sketches, possibly from a larger work on history or biographies.
rant, the sun appears without an harbinger, and they all disappear together. At fun-rising, the thermometer is from 48° to 60°. At three o'clock in the afternoon, it is from 99° to 115°. Hence an universal relaxation, a kind of irresistible languor, and aversion to all action, takes possession of both man and beast; the appetite fails, and sleep and quiet are the only things the mind is capable of defining, or the body of enduring. Cattle, birds, and beasts, all flock to the shade, or to the neighbourhood of running streams, or deep stagnant pools. From the same motive, the wild beast flirs not from his cave; and for this too he has an additional reason: because the cattle he depends upon for his prey do not stir abroad to feed; they are asleep and in safety, for with them are their dogs and their shepherds. But no sooner does the sun set, than a cold night instantly succeeds a burning day; the appetite immediately returns, the cattle spread themselves abroad to feed, and pass quietly out of the shepherds' sight, into the reach of a multitude of beasts seeking for their prey. Fires, the only remedy, are every where lighted by the shepherds to keep the climate at a respectful distance; and dancing, singing, and music, gradually stir the multitude, alarming the beasts of prey, to keep their flocks in safety, and prevent the bad effects of severe cold. This was the cause of the observation Hanno made, failing along the coast; and it was true when he made it. Just the same may be observed still, and will be, so long as the climate and inhabitants are the same; and thus it has been lately described by Mr. Bruce.

"They then passed by a country burning with fire, which was accompanied with perfumes; and freams of fire, supplied thence, fell into the sea." This fact likewise is excellently illustrated by Mr. Bruce. "After the fire," says he, "(which was lighted for the purpose of destroying the cover for the animals which they hunt,) he (Hanno) observed that the day was gray, and grayish it, done the fame up to the top of the highest mountains, the large ravines or gullies, made by the torrents falling from the higher ground, being shaded by their depth, and their being in possession of the last water that runs, are the last to take fire, though full of every fort of herbage. The large bamboos, hollow canes, and fuch like plants, growing as thick as they can stand, retain their greenness, and are not dried enough for burning, till the fire has cleared the grases from all the rest of the country; at laft, when no other fuel remains, the herdmen on the tops of the mountains set fire to thefe, and the fire runs down in the very path in which, some months before, the water ran, filling the whole gulley. While this was going on, the smoke, which does not stop for a moment, is carried by the ocean below, where the torrent of water entered, and where the fire of course ceases. This I have often seen myself, and been often nearly enclosed in it; and can bear witness, that, at a distance, and by a stranger ignorant of the cause, it would hardly be distinguished from a river of fire.—Thus does the voyage of Hanno, which has long been confidered as a fable, appear genuine and rational in all its parts.

HANNOVILLE SOUS LES COTES, a town of France, in the department of the Meuse, and chief place of a canton, in the diocfe of St. Mihiel; three leagues north-north-east of St. Mihiel, and four south-east of Verdun.

HANNOYS, a small ifland in the English Channel, about half a mile from the west coast of the ifland of Guernsey.

HANNUYE, a town of Brabant, twenty miles west of Liege.

HAN'OCH, [Heb. dedicated.] A man's name.

HAN'ONCITE, a defendant of Hanoch.

HAN'OCK, a corn-meafure at Malaga in Spain, containing unheaped 129 pounds, or heaped 144 pounds, avoirdupois.

HANOSFALVA, a town of Hungary: twelve miles north-east of Szében.
have an excellent education, are instructed in every science that relates to their profession, and are taught the duties of christians, and of citizens, before they are permitted to assume a command over their fellow men. In general, this author bestows great praise on the police, for the attention which it pays to the instruction of the people. The principal freets have large subterranean canals, through which the dirt of the city is conveyed by running water to the river. In the winter evenings, the town is well lighted, and the comforts of society admirably conducted. A regulation, on which the citizens have agreed, in cafes of fire, deferves imitation. Each person is provided with a large fack, and, when a fire happens, all the neighbours repair to the house with their facks; and each has his several task assigned to him, the furniture and goods are soon removed, with as little confusion as possible, and the sufferer is certain of their being lodged in safe hands. Hanover is very populous, considering its size, particularly the old town; the number of equipages seen in the streets shews that it contains many wealthy citizens; and the mode of living becomes daily more luxurious; though not so much so as among the merchants in Hamburg. Hanover is now (Feb. 1808) in the hands of the French. Fifty-eight miles south-east of Bremen, and a hundred and forty west of Berlin. Lat. 52. 27. N. lon. 17. 15. E. Ferro.

**HANOVER (Electorate of),** comprehends the dukies of Zell, Saxe-Lauenburg, Bremen, Luneburg, the principalities of Calenburg, Verden-Grubenhagen, Diepholz, Hoya, Oberwald, &c. The dignity of elector was conferred on Ernest Augustus, duke of Brunswick Hanover, by the emperor Leopold, in 1693, as a reward for the great services done by the duke in a war with the French king Louis XIV. This new creation met with great opposition, both in the electoral college and the college of princes; but at last, by a conclusion of the three colleges, on the 30th of January, 1708, it was unanimously determined that the electoral dignity should be confirmed to the duke of Hanover and his heirs male; but it was added, that if, while that electoral dignity subsisted, the Palatine electorate should happen to fall to him, the furniture and goods are soon removed, with containing thirty-five rooms for students. Its situation is elevated, healthful, and pleasant, commanding an extensive prospect to the west. There are three other public buildings belonging to the college; and a handsome congregational meeting-house has lately been erected, in which the commencement exercises are exhibited. It is thirty-four miles south-east of Portmouth, 158 north-east-by-north of Boston, and 378 north-east-by-north of Philadelphia.

Hanover, a township of the American States, in Morris county, New Jersey. On a ridge of hills in this town are a number of wells, forty miles from the sea in a straight line, which regularly ebb and flow about six feet twice in every twenty-four hours. It is about sixteen miles north-west of Elizabeth Town, and joins upon Morristown.

Hanover, a county on the north-west part of the island of Jamaica.

Hanover, a bay in the sea of Honduras, situated on the east side of the peninsula of Yucatan, from which it receives the waters of the Rio Hondo. The tract of land between the river Hondo and the Balize was ceded by the Spaniards to the king of Great Britain, at the peace of 1783, for the purpose of cutting and carrying away logwood.

Hanover, a town of the American States, in Luzerne county, Pennsylvania. Also a township in Washington county, Bait and Welf Hanover, are two townships in Dauphine county in the same state.

Hanover, or Mallister's town, a pott-town of the American States, in New York county, Pennsylvania, situated between Cadorus creek, and a branch of Little Conewago, which flows into the Susquehannah. It contains nearly three hundred dwelling houses, and a German and Lutheran church; seven miles north of the Maryland line, eighteen miles south-west of York, and six miles east of the state-house.

Hanover, a township of the American States, in Plymouth county, Massachusetts, twenty-five miles south-east from Boston; incorporated in 1727, and contains 1083 inhabitants.

Hanover, a poll-town of the American States, in New Hampshire, situated on the east side of Connecticut river in Grafton county. Dartmouth College, in this town, is situated on a beautiful plain, about half a mile from the river, in lat. 43. 43. N. lon. 72. 14. W. from Greenwich. It derives its name from William earl of Dartmouth, one of its principal benefactors, and was founded in 1769, by the late Dr. Eleazer Wheelock. The funds of the college consist chiefly of lands, amounting to about 80,000 acres, which are increasing in value in proportion to the growth of the country; 13,000 acres lie contiguous to the college, and are capable of the highest improvement; 13,000 lie in Vermont. A tract of eight miles square was granted by the Assembly of New Hampshire in 1778. This grant was exercised by the college, arising from the lands, in 1793, amounted annually to 1401. By contracts then made, they would amount, in four years after, to 4501. and in twelve years to 6501. The income from tuition is about 6001. per annum. The number of under-graduates is, on an average, from 170 to 180. A grammar-school of about fifty or sixty scholars is annexed to the college. The students are under the immediate government and instruction of a president, who is also professor of history, a professor of mathematics and natural philosophy, a professor of languages, and two tutors. The college is furnished with a handsome library, and a philosophical apparatus tolerably complete. A new college edifice of wood, 150 by 100 feet, and three stories high, has been erected, containing thirty-five rooms for students. Its situation is elevated, healthful, and pleasant, commanding an extensive prospect to the west. There are three other public buildings belonging to the college; and a handsome congregational meeting-house has lately been erected, in which the commencement exercises are exhibited. It is thirty-four miles south-east of Portmouth, 158 north-east-by-north of Boston, and 378 north-east-by-north of Philadelphia.

Hanover, a town of the American States, in Virginia, lying between Pamunky and Chickahominy rivers. Its length is about forty-eight miles, and its breadth twenty-two, and contains 14,754 inhabitants.

Hanover, a town in the county of New, an island in the Pacific Ocean, discovered by captain Carteret, in 1767, about ten leagues in length. The south-west part situated in lat. 24. 29. S. lon. 138. 27. E. Greenwich.

Hanoverian, adj. Belonging to Hanover, born in Hanover, produced in Hanover.

Hanoverian, n. A native of Hanover.

Harrow, a town of Germany, in the duchy of Holstein; fourteen miles east of Meldorf.

Hansbach, a town of Bohemia, in the circle of Litomeritz, with manufactures of cotton, thread, and paper: twelve miles north of Kaminitz.

Hanse, f. [Gothic.] A society of merchants, for the good usafe and safe passage of merchandise from one kingdom to another. The hanse or mercatorum societas, was and in part yet is endowed with many large privileges by princes within their territories, and had fortified royal towns or staples, where the Almain, or German and Dutch merchants, being the founders of this society, had an especial house appointed for their use; one of which was in London, called the Steel-yard.

Hanseatic league, the league or confedency which formed the first systematic plan of commerce
in Europe, and secured the franchises of the Hanse-towns. It is conjectured by professor Mallet, who published his excellent history of the Hanseatic League in 1364: but the first germ of this confederacy was put forth about the year 1255. No monuments, however, have been preserved, which record the origin and the early transactions of this famed confederacy: but the supposition, which refers its date to the latter part of the thirteenth century, cannot be very wide of the truth. The union, it is imagined, at first only embraced the maritime towns, and was probably no more than temporary. It is observed by one of the historians of the league, "that its commencement was feeble, its progress rapid, and its success astonishing; and the confederacy, favoured by circumstances, dexterously availed itself of the advantages which fortune threw in its way." The first members, and their associates, could not possibly foresee that they were laying the basis of a confederacy, which was defined one day to extend its commerce and its empire over the two seas of the North, to give laws to the inhabitants of their shores, and which would at pleasure humble and exalt emperors and kings. It was the maritime cities of Lower Germany that gave rise to the Hanseatic League, and it was particularly in navigation that its first fortune. This source had for a long time previously furnished them with subsistence, but they did not derive power from it till experience, policy, and wisdom, had consolidated and confirmed their union; and in which the rudeness of the times completely concurred. The shores of the Baltic, from Lubeck to Ruffia, were inhabited, and their merchants and factors formed a corporation. This free association of the confederated cities began rapidly to advance. Cologne, Lubeck, Hamburg, Saxt, and Bremen, obtained important franchises. These inhabitants were transplanted into the districts which war had depopulated, and the nuts of the barbarians were replaced by the cities of Rostock, Wismar, and Stralsund. About the same period, Livonia was discovered; and through the intervention of the confederated cities the king of Sweden was induced to barter the liberty of his subjects, which he had engaged in the franchise of its inhabitants, caused many privileges to be granted to them, and led to confederacies which greatly contributed to their subsequent prosperity. From this time, therefore, the navigation of the confederated cities began rapidly to advance. Cologne, Lubeck, Hamburg, Saxt, and Bremen, obtained important franchises. These cities furnished them with subsistence, and they held deliberative meetings in their metropolis. They were long allowed to extend and strengthen their commercial empire in this island; and they are recorded in our histories as the "Merchants of the Steel-yard." This free association of the cities of the Baltic coast, which was almost exclusively the ports of Sweden, Denmark, and Norway; and they had penetrated from Livonia to Novgorod, one of the most celebrated cities of Ruffia. We find them also employing an armed fleet against a king of Norway, who disputed the privileges which they claimed in his ports: they triumphed, and the prince was obliged to re-annulate them in their rights. In the thirteenth century, the Hanseatic league did not consist of more than ten or twelve cities, and those principally situated on the Baltic. In the century which succeeded, the association extended from the Scheldt and the isles of Zealand to Livonia; inland cities, and even large districts, solicited the honour of being admitted members; while smaller cities were allowed to become dependants on it, and were affiled to the general expense in proportion to their capacities. In consequence of their war with Waldemar III, king of Denmark, they were induced to perfect their league; and it is conjectured that the act of general confederacy was first framed on that memorable occasion. The first mention of it refers to this period; and it was settled at an assembly of the deputies of cities, held at Cologne in 1364: but this great charter is no longer in existence. It was at the same time that the league assumed the name of Hanseatic: the word Hanse, in the language of Lower Germany, signifies league.

Accounting for the successful resistance made by the members of the league against the princes of Scandinavia, (the cradle, as it is called, of nations, and the country of the fierce Normans,) M. Mallet observes, that the ardour which was inspired by newly-acquired liberty, the love of gain, and the dread of poverty and slavery, gave to the inhabitants of the associated cities a force which more than equalled that of half-peopled extensive provinces. The cities possessed union, subordination, and pecuniary resources: while in the monarchies the federal associations were at variance, faction and disturbances predominated, revolution succeeded revolution, and feudal anarchy was at its height.

The government of most of the Hanse-towns was formed on the model of that of Lubeck. In this city, a senate composed of ancient families and wealthy merchants possessed that power over the people which respect and confidence confer, and which was sufficient to enable it to promote the welfare of the state, but not to oppose it. The author terms this a happy order of things. Only a limited number of persons, which was most proper for its situation and its circumstances, most suitable to the spirit of the times, and to its foreign and domestic relations. The histories of this period exhibit so various instances of the beneficial effects of such a régime, and of its connection with a state of prosperity in which commerce could claim no other in the annals of maritime population than what the pride of the armies of the northern princes, which consisted of vassals, among whom was no subordination, who felt no attachment to their chiefs, and who served only for a limited time; opposed on the part of the cities by valiant, warlike, and well-armed, burghers, who had not been enraptured by opulence, but who were in that state of mediocrity which might be considered as the fate of independent states. The war operations were combined and directed by the counsels of men of mature understanding and experience, who were devoted to their country, responsible for their measures, enjoyed the public confidence, and who showed that they well understood the public interests, that they could treat with foreign princes, profit by their division of united and render them respectively the instruments of weakening each other.

To the early exertions of the Hanseatic confederacy, Europe is indebted for the extinction of those hordes of northern pirates, which for a long time ravaged the countries of the South, which for a long time held society unsettled, and which threatened universal barbarism. We may judge of the terror which they inspired in the years 1282 and 1283, in which they devastated all Norway, and all its strong places, were made over to the conquerors; a monopoly of the trade was confirmed to them; and all its fishery on the southern coast of Sweden. At the peace, nearly the whole of Scania, two-thirds of its revenue, and all its strong places, were made over to the conquerors; a monopoly of the trade was confirmed to them; and in 1370, the league compelled Haquin king of Norway to renounce his crown. To the exclusive possession of the trade of the three kingdoms of the North by the league, we must add the sway which it bore in Flanders, Brabant, Holland, and Zealand; the chief cities of which provinces were at this time included among its members; and at the same period, the league consisted of seventy-seven cities. To the South, the commerce of the Hanse-towns was principally confined to Flanders and England; for it had not as yet any establishments in France. Indeed it was not in those days very easy to navigate on the French coasts, because the barbarous
right of shipwreck was admitted and sanctioned by its kings, while the admiral flourished in the infamous plunder. The league carried on no direct commerce with Spain, Portugal, Italy, and the Levant, but purchased the productions of those regions in the markets of Flanders.

In the Hanse-towns, manual industry had made no extraordinary progress; and they manufactured only a very coarse kind of cloth. Their commerce fell under the description of what in modern times is styled the carrying-trade; since they purchased cloths in England and Flanders, which they sold in the countries of the north and the east. In the same way they dealt in the wines of the Rhine, the beer for which Germany was then noted, in grain and malt, in the linen cloths of Saxony and Westphalia, and in certain minerals and metals. This commerce would have been much more extensive, had it not been checked by the restrictions imposed on every species of industry in the German towns: it was therefore of little consequence when compared with the exclusive trade which the members of the league maintained with the northern kingdoms, and the immense regions of the north-east of Europe.

Though history does not inform us what the league ever did to establish its independence and liberty which it had acquired, to obtain additional privileges when circumstances favoured, and to extend its commercial relations. The renewal of the act of confederacy, in 1438, informs us what were the principal views of the league at that period, and what it regarded as the principal ends of its confederacy. This act was decreed in a congress of deputies from the member cities of the league that was called to regulate all the circles to which the association extended. The cities mentioned in this act mutually bind themselves to seek the glory of God, and to maintain peace and order in the cities and territories of the league against all the world, the emperor alone excepted; referring also what each confederate party owes to its lawful lord in honour and justice. They engage to assist and defend each other, and, in case any member is attacked, the members of the confederacy, tumults and disorders to guide, to restrain, and to reduce to peace; and as far as may be possible, to remove those points of difference which arose, whether between the members of the league themselves, or between any of them and strangers; and to the same body it belonged to see its sentences carried into execution.

The defeat of the congress was not fixed, but it was generally held at Lubeck, where its archives were kept. This city, well situated for commerce, and enriched by it, had a great ascendancy in the league, and was regarded as its head. Numerous instances occur, however, of their meeting elsewhere, as in Hamburg, Bremen, the cities of Lower Saxony and Westphalia, and even much lay without the limits of Germany. The time of holding the congress was not more fixed than was the place of its sitting, but was determined by circumstances and events. A decree which passed in 1430, ordained that it should be assembled once in three years at Lubeck, if its necessities should not render more frequent meetings necessary: but we are informed that, in fact, scarcely a year passed in which it did not assemble. It was most commonly by the regency of Lubeck that the congress was summoned to meet, but the councils of Wismar, Rostock, and Stralsund, sometimes performed the same office. In this confederacy, the power refted chiefly on a senate of common interest, which was kept up by the constant presence of the emperor, and the number of deputies requisite to constitute a legal assembly was never fixed, but the assembly itself at its meeting determined whether it was numerous enough to bind the confederacy by its acts. The attendance of thirty or forty deputies was generally deemed sufficient for this purpose.

As the external danger diminished, disunion began to prevail among the members of the league; and powerful cities refused obedience to the enactments of the supreme authority, while neither perusals nor threats were able to remove their contumacy. The foreign factories, those of London, Bruges, Bergen, and Novo-gord, had a right to send deputies to the congress of the confederacy, to make their representations, but not to take any share in its deliberations. The inhabitants of foreign powers, those of the emperor, of the kings of France, England, Scotland, Denmark, and Sweden, were admitted to audiences on the same occasions. At Lubeck, was a hall in which the assemblies of the league were held, the vast extent of which serves to give an idea of its ancient grandeur. One of the burgomasters of Lubeck presided on these occasions; on his right sat the deputy of Cologne, and on his left that of Hamburg; the others usually had places according to the date of their accession to the confederacy.

During the prosperous days of the Hanseatic league, the objects of diffusion in its assemblies were numerous and important. Commerce, an unframed navigation, franchises, privileges of all kinds to prefer, to extend, and to explain, foreign factories to superintend and protect, negotiations to carry on with the several states of Europe, measures to guide, to restrain, and to reduce to their duty, the members of the confederacy, tumults and revolts to repress, instructions to demand, subsidies to grant, all were definite reports to the congress, and engaged its attention during a long series of sittings. Whether measures were carried by the majority of voices, or whether in some if not in all cases
cases unanimity was necessary, we have no documents to ascertain. At the close of the session, the enactments were drawn up in one general statute, a transcript of which was communicated to each deputy, sealed with the seal of the city of Lubeck. It was forbidden to show these statutes to strangers. During the interval of the sessions of congresses, the direction of the general affairs of the league, internal and foreign correspondence, and other urgent matters, were entrusted to a permanent committee of the deputies of Lubeck, united with the deputies of five of the neighbouring cities. In course of time, this committee attained to a very predominant influence in the deliberations of the general assemblies; and the city, in which it sat, was considered as the capital of the league.

This important confederation was divided into three circles; the first embraced the cities situated on the southern and eastern shores of the Baltic, the second those of Weftphalia, and the third those of Saxony. In each circle, one city exercised the fame fort of supremacy with that which Lubeck claimed over the whole league, and to the subordination that was due to him: and to the federation. At the end of the session, the enactments that were drawn up in one general statute, a transcript of which was communicated to each deputy, were sealed with the seal of the city of Lubeck, united with the deputies of five of the neighbouring cities. In course of time, this committee attained to a very predominant influence in the deliberations of the general assemblies; and the city, in which it sat, was considered as the capital of the league.

This (late of things applies very generally to the cities during part of the fifteenth and sixteenth centuries. The ascendency which the league obtained, in consequence of the triumph of its arms over Waldemar III. as noticed above, rendered it sufficiently bold to engage in warfare with the celebrated Semiramis of the North, the renowned Margaret queen of Denmark, Norway, and Sweden; and they employed against her the pirates known under the name of Vitalians; but a few of common intercell induced both the parties to make peace, and the league, confirmed, by the league, confirmed the league in their ancient rights. The league dreaded the effects of the celebrated union of Calmar: but the moderation of the heroine, and the weakness of her succcessors, prevented their apprehensions from being realized in their utmost extent. See the article Denmark, vol. v. p. 721. With Eric, the successor of Margaret, the league, confirmed the league in their ancient rights. The league dreaded the effects of the celebrated union of Calmar: but the moderation of the heroine, and the weakness of her successors, prevented their apprehensions from being realized in their utmost extent. See the article Denmark, vol. v. p. 721.

With the emperor of Germany, the league is said to have uniformly coquetted; while it never respected his authority when it interfered with its views and interests, nor ever consulted him in regard to any of its measures. On the other hand, the emperor, unable to control, was constrained to wink at, its proceedings. It is true that the famous golden bull protected all the league and confederacies, as contrary to the rights of the supreme head, and to the subordination that was due to him: but this was an empty fulmination; and Charles IV., the author of this famous edict, deemed it more politic to attempt by intrigue and address to get himself appointed head of the league, than to endeavour to carry his vain attempts into effect. See the article Germany, vol. viii. p. 485. The leaders of the confederacy, however, had the address to penetrate his designs, and effectually eluded them.

The prosperity of the league after the zenith of its glory, came to be disturbed by the tranactions which prevailed in particular cities that were members of it. In a vain attempt to carry his vain attempts into effect. See the article Germany, vol. viii. p. 485. The leaders of the confederacy, however, had the address to penetrate his designs, and effectually eluded them. The prosperity of the league after the zenith of its glory, came to be disturbed by the tranactions which prevailed in particular cities that were members of it. the most essential affiance from the naval superiority of the league. By favouring the escape of the young Gustavus Vasa, the cities accomplished what had been to long the object of all their efforts, the dissolution of the union of Calmar; a measure which, as professor Mallet observes, had been more the occasion of disquietude, than the cause of any mischief to the confederacy. Soon afterward, the league had the good fortune to see Gustavus reduce the whole of Sweden to his obedience, its enemy Christian II. deposed, and his crown seized. Mallet observes, had been more the occasion of that wish which the three northern kingdoms regarded tune to see Gustavus reduce the whole of Sweden to his the occasion of the league having afforded material af¬

disquietude, than the cause of any mischief to the confe¬

solution of the union of Calmar; a measure which, as pro-

fessor Mallet observes, had been more the occasion of that wish which the three northern kingdoms regarded tune to see Gustavus reduce the whole of Sweden to his

The Hanseatic cities having joined the opponents of Christian, was a sufficient reason for inducing the Dutch cities to aid him in recovering his dominions; but every exertion in this attempt failed. On the occasion of the league having afforded material affiance, the Dutch, on their part, were induced to return that the Sound should be free against the Dutch; but this people disregarded the claims of the confederacy, and on every occasion favoured their rivals. There is perhaps no instance of a jealousy more strong and permanent, than that which the three northern kingdoms regarded the Hanseatic league.

The following are the tragical particulars of the dreadful war waged by Lubeck, under the influence of the demagogue Wullenwer, affiliated by the blacksmith Meyer of Hamburg, against Denmark; which was indebted for its deliverance to its newly-chosen monarch Christian III. who was as beneficent as he was brave. Wullenwer, who had changed the government of Lubeck, who ruled in it with absolute sway, and who, aided by his associate, the low-born hero Meyer, few Denmark nearly subjudget, was destined at last to ex¬

ter a reverse of fortune; his star yielded to that of the lawful monarch; and when success forsook his standard, the abject multitude, which had before adored him, sacrificed both him and his colleague to its disappointment.

The rivers St. Croix, Jenetcoot; and Coc¬

miguen, empty into the Avon, and are all navigable except the last. The Cassague and Cobeguit are navigable forty miles for vessels of fifty tons.

HAN'S, a county of Nova Scotia, in British America, beginning about thirty miles from Halifax, contains the townships of Windfor, Falfrom, and Newport; several valuable tracts yet remain unsettled. The road from Halifax runs part of the way between Windfor and Newport, and has settlements on it at small distances. The county is about twenty miles square.

HAN'TS, the common appellation for the county of Hampshire in England.

of society. He was the principal instigator of the Marine Society, for the purpose of training friendless and deserted boys to the service of the navy; and he attended, in other respects, to the great national object of manning the British fleet. The Magdalen charity, for the reformation of unfortunate females, first planned by Mr. Hanway, was much indebted to his activity for its establishment and success. Scarcely anything occurred of a nature to excite the humane feelings, which did not call forth his benevolent efforts. His fellow-citizens entertained such a fancy of his merits, that, in lord Bute’s administration, a deputation of the principal merchants of London waited upon him, with a requisition that some public favour might be conferred on a man who had done so much service to the community at the expense of his private fortune. Mr. Hanway was in consequence made a commissioner of the navy, which, poll he held of his private fortune. Mr. Hanway was in consequence, public favour might be conferred on a man who had entertained such a sense of his merits, that, in lord Bute’s

HAP, HAP, HAP,

She had her head in her lap, and nourishing fresh leaves and blossoms did enwrap. In her rude hairs sweet flowers themselves did lap, and curst be they that build a coverlet for a bed.

**Hapless**

That which happens by chance or fortune.—A fox had the hap to fall into the hands of a lion. L’Éjfrange.

Curst be good hap, and curst be they that build Their hopes on hap, and do not make despair For all these certain blows the surest shield.

**Haply**

**Hap hazard**

That which happens by chance or fortune.—A fox had the hap to fall into the hands of a lion. L’Éjfrange.

Curst be good hap, and curst be they that build Their hopes on hap, and do not make despair For all these certain blows the surest shield.

**Hap hazard, Hap hazard**

That which happens by chance or fortune.—A fox had the hap to fall into the hands of a lion. L’Éjfrange.

Curst be good hap, and curst be they that build Their hopes on hap, and do not make despair For all these certain blows the surest shield.

**Hap hazard**

That which happens by chance or fortune.—A fox had the hap to fall into the hands of a lion. L’Éjfrange.

Curst be good hap, and curst be they that build Their hopes on hap, and do not make despair For all these certain blows the surest shield.

Truth and peace, and love, shall ever shine
About the supreme throne.

Of him, 'tis whole happy state alone,
Our heavily guided soul shall climb.

Lucky; successful; fortunate:
Yet in this agony his fancy wrought,
And fear supply'd him with this happy thought.

Addressful; ready.—One gentleman is happy,
And which they draw up after them, to prevent surprize.

And fear supply'd him with this happy thought.

A coat of mail.

Spenfcr.

HA'QUETON, f. pronunciator, orator, haranguer, haranguer.

HA'RA, a city of Affryia, situated near the river Gozan, to which part of the Reubenites, Gadites, and half tribe of Manafich, were led captive by Tylath-pilefer.

HA'RA, a lake of Asia, in Tibet.

HA'RA-OSO, a town of Asia, in Tibet: forty-eight miles west-north-west of Chatcheou.

HA'RA-PALGA'SON, a town of Asia, in Tibet: twenty-five miles south-east of Oramtchi-Hotun.

HA'RA-TOU'BE, a town of Asia, in Tibet: thirty-seven miles west of Hami.

HA'RACH'ROTUN, a town of Asia, in Tibet: 160 miles west of Tourfan.

HA'RADAH, the twentieth encampment of the Israelites in their journey from Egypt to Canaan. Num. xxxiii. 24, 25.

HA'RAFO'RAS, a wandering tribe of Indians, supposed to have been the primitive inhabitants of some of the Manilla islands, and driven from their native home by the Spaniards, soon after their conquest of the Philippines. They employ themselves chiefly in cultivating succulent vegetables; and live in trees, which they ascend by means of a pole cut with notches on its sides, and which they draw up after them, to prevent surprize.

HA'Raker, a river of China.

HA'RANE, or CH'IAR'AN, of NA'Hor, a city of Mopotamia, or Padan-aram, where Terah the father of Abraham settled, after his departure from the Chaldees; and where he also died. As he was probably the founder of this place, he might name it after his son Haran who died in Ur; and its being fitted the city of Nahor, might arise from the permanent establishment of that house here, after the departure of Abraham from hence. It was the birth-place of Rebecca, wife of the patriarch Isaac, also of Leah and Rachel, the wives of the patriarch Jacob, who fled hither to avoid the fury of his brother Esau; and where he served his uncle Laban (who was also a native of this place) twenty-one years. It is mentioned as a place of confecution in the days of Hezekiah, being at that time, it should seem, but recently subdued by Assyria; and the sea of Ezekiel, as having been a place of great trade. In history it is also memorable for the defeat and death of Carthius, and for the murder of Caracalla. Gen. xi. 28. 32. xii. 4. xxiv. 10, &c. xxvii. 43. xxix. 2 Kings xix. 12. Ezek. xxvii. 23.

HA'RINGUE, f. [arangues, Fr.] The original of the French word is much questioned; Menage thinks it is a corruption of hearing, English; jantius imagines it to be different from ear, to a circle, one in which the Italian arringo seems to favour; perhaps it may be from orarion, orationem, orationer, orator, orarior, orarion, arangue, harangue.] A speech; a popular oration.—Nothing can better improve political school-boys than the art of making plausible or plausible harangues, against the very opinion for which they resolve to determine. Swift.

Gray-headed men, and grave, with warriors mix'd
Allarme, and harangues are heard, but soon
In factious opposition. Milton.

HA'RASSING,/. The act of wearisome with labour.

HA'RASS, v. a. [harajser, Fr. from haraj, a heavy buckler, according to Du Cange.] To weary; to fatigue; to tire with labour and uneasines sometimes with out, which increaseth the force of the verb.—These troops came to the army but the day before, harraffed with a long and weary march. Bacon.

Nature oppress'd, and harafl'd out with care,
Sinks down to reft. Adelphon.

HA'RA, a river of China.

HA'RANT, f. [harmant, Fr.] To make a speech; to pronounce an oration.

HA'RAN, or NA'Hor, a wandering tribe of Indians, supposed to have been the primitive inhabitants of some of the Manilla islands.

HA'RARITE, an inhabitant of Haran. See HARRARITE.

HA'RASS, f. An orator; a public speaker: generally with some mixture of contempt.

HA'RAFO'RAS, a wandering tribe of Indians, supposed to have been the primitive inhabitants of some of the Manilla islands, and driven from their native home by the Spaniards, soon after their conquest of the Philippines. They employ themselves chiefly in cultivating succulent vegetables; and live in trees, which they ascend by means of a pole cut with notches on its sides, and which they draw up after them, to prevent surprize. A forerunner; a precursor. — Love's harbingers appeared. Milton.

Make all our trumpets speak, give them all breath,
Those clamorous harbingers of blood and death. Shaksp.

HA'RO, a town of Sweden, in the province of Dalmarand: twenty miles north-north-west of Upfal.

HA'RO'NAHs, a town of France, in the department of the Somme: five leagues east of Amiens, and four north of Montdidier.

HA'RO, a town of Sweden, in the province of Westmanland: twelve miles north of Vefleros.

HA'RO'SALUM, f. In old records, a breed or stud of horses.

HA'RO-PAI'HOTUN, a town of Asia, in Tibet: 370 miles west of Tourfan.

HA'RO, or CH'IAR'AN, or NA'Hor, a city of Mopotamia, or Padanaram, where Terah the father of Abraham settled, after his departure from the Chaldees; and where he also died. As he was probably the founder of this place, he might name it after his son Haran who died in Ur; and its being fitted the city of Nahor, might arise from the permanent establishment of that house here, after the departure of Abraham from hence. It was the birth-place of Rebecca, wife of the patriarch Isaac, also of Leah and Rachel, the wives of the patriarch Jacob, who fled hither to avoid the fury of his brother Esau; and where he served his uncle Laban (who was also a native of this place) twenty-one years. It is mentioned as a place of confluence in the days of Hezekiah, being at that time, it should seem, but recently subdued by Assyria; and the sea of Ezekiel, as having been a place of great trade. In history it is also memorable for the defeat and death of Carthius, and for the murder of Caracalla. Gen. xi. 28. 32. xii. 4, xxiv. 10, &c. xxvii. 43, xxix. 2 Kings xix. 12, Ezek. xxvii. 23.

HA'RAN'GUE, v. a. [harranger, Fr.] To make a speech; to pronounce an oration.

HA'RAN'GUER, an orator; a public speaker: generally with some mixture of contempt.

HA'RAFO'RAS, a wandering tribe of Indians, supposed to have been the primitive inhabitants of some of the Manilla islands, and driven from their native home by the Spaniards, soon after their conquest of the Philippines. They employ themselves chiefly in cultivating succulent vegetables; and live in trees, which they ascend by means of a pole cut with notches on its sides, and which they draw up after them, to prevent surprize.

HA'RABLE, or CH'IAR'AN, of NA'Hor, a city of Mopotamia, or Padanaram, where Terah the father of Abraham settled, after his departure from the Chaldees; and where he also died. As he was probably the founder of this place, he might name it after his son Haran who died in Ur; and its being fitted the city of Nahor, might arise from the permanent establishment of that house here, after the departure of Abraham from hence. It is mentioned as a place of confluence in the days of Hezekiah, being at that time, it should seem, but recently subdued by Assyria; and the sea of Ezekiel, as having been a place of great trade. In history it is also memorable for the defeat and death of Carthius, and for the murder of Caracalla. Gen. xi. 28. 32. xii. 4, xxiv. 10, &c. xxvii. 43, xxix. 2 Kings xix. 12, Ezek. xxvii. 23.

HA'RAN'GUE, f. [harranger, Fr.] The original of the French word is much questioned; Menage thinks it is a corruption of hearing, English; jantius imagines it to be different from ear, to a circle, one in which the Italian arringo seems to favour; perhaps it may be from orarion, orationem, orationer, orator, orarior, orarion, arangue, harangue.] A speech; a popular oration.—Nothing can better improve political school-boys than the art of making plausible or plausible harangues, against the very opinion for which they resolve to determine. Swift.

Gray-headed men, and grave, with warriors mix'd
Allarme, and harangues are heard, but soon
In factious opposition. Milton.

HA'RASS, f. The act of wearisome with labour.

HA'RAFO'RAS, a wandering tribe of Indians, supposed to have been the primitive inhabitants of some of the Manilla islands, and driven from their native home by the Spaniards, soon after their conquest of the Philippines. They employ themselves chiefly in cultivating succulent vegetables; and live in trees, which they ascend by means of a pole cut with notches on its sides, and which they draw up after them, to prevent surprize. A forerunner; a precursor. — Love's harbingers appeared. Milton.

Make all our trumpets speak, give them all breath,
Those clam'rous harbingers of blood and death. Shaksp.

HA'RO, a town of Sweden, in the province of Westmanland: twelve miles north of Vefleros.

HA'BOROUGH. See Market-Harborough.

HA'BOB, fr. Sax. of hecne, an army, and hot, a house, to called, because it was a place where soldiers kept their quarters. — A town in Northumberland.

HA'B'OR, f. [harrberg, Fr. herberg, Dut. alberga, Ital.] A lodging; a place of entertainment.

Harbour for a thousand doors they knock'd; Not one of all the thousand but was lock'd. Dryden.

An asylum; a shelter; a place of shelter and security:
They leave the mouths of Po,
That all the borders of the town o'erflow;
And spreading round in one continu'd lake,
A spacious hospitable harbour make. Addison.

By the constitutional law of England, the king has the prerogative of appointing ports and harbours for persons and merchandise to pass into and out of the realm, as he in his wisdom shall seem proper. By the feudal law, all navigable rivers and harbours were computed among the regalia, and were subject to the sovereign of the state. And in England it hath always been held, that the king is lord of the whole shore, and guardian of the ports and harbours, which are the inlets and gates of the realm. Dav. 9. 56. Therefore as early as the reign of king John, we find ships feized by the king's officers for putting in at a place that was not a legal port.
port. Madox. Hist. Exh. 420. These legal ports were undoubtedly at first affigned by the crown; since to each of them a court of portmote is incident, the jurisdiction of which must flow from the royal authority. 4 hist. 428. The great ports of the sea are also referred to, as e.g. Plymouth, by the 4 Hen. IV. c. 20, which prohibits landing elsewhere under pain of confiscation and the flat. 1 Eliz. c. 11, recites that the franchife of lading and discharging had been frequently granted by the crown.

But though the king had a power of granting the franchise of harbours and ports, yet he had not the power of revocation, or of surrendering and confining their limits when once established; but any person had a right to lade or discharge his merchandise in any part of the haven: whereby the revenue of the customs was much impaired and diminished, by fraudulent landings in obscure and private quarters. This produced the flats. 1 Eliz. c. 11 and 14 Car. II. c. 11; which enabled the crown by comination to aftenart the limits of all ports, and to affign proper wharfs and quays in each port, for the exclusive landing and lading of merchandise. 1 Comm. 246. c. 7. And by the flat. 19 Geo. II. c. 22, if any matter be a ship shall call out of any ship, riding in any harbour, &c. any ballast, &c. but only by a lane, where the tide never flows or runs, he may be fined by the justices, not more than five pounds nor less than fifty shillings. As soon as any ship shall be sunk, frammed, or run on shore, in any harbour, &c. or be brought or drove in, or be there in a ruinous condition, and there be suffered to remain, and the owner shall begin to carry away the rigging; on summons of the owner, or commander, a justice may seize the ship, &c. and by sale thereof, the money to clear the debt or damage.

Many other acts of parliament have been made for repairing and improving particular harbours in this kingdom; viz. flats. 23 Hen. VII. c. 7, 27 Hen. VIII. c. 23; relating to the ports of Plymouth, Portsmouth, Falmouth, &c. in Devonshire and Cornwall; whereby it is enacted none shall labour in the tin works near the rivers of those harbours, but shall prevent the fall of dunes and gravel therein. Stat. 27 Eliz. c. 1, was for repairing Orford haven in Suffolk; and flats. 13 and 14 Car. II. 4 Geo. I. c. 13; &c. for the repair of Dover harbour. Stat. 20 Geo. II. c. 14, was made for opening Southwold haven in Suffolk. Stat. 20 Geo. II. c. 15, was made for improving Sunderland harbour in Durham. Stat. 27 Geo. II. c. 8, for repairing and enlarging the harbour of Leith. For the construction of Harbours, &c. see the article ARCHITECTURE, vol. ii. p. 127.

To HARBOUR, v. n. To receive entertainment; to sojourn; to take shelter.—This night let's harbour here in York. Shakespeare.

Let me be grateful; but let far from me Be fawning cringe, and false difembling look, And revile Battery, that harbours oft Philips.

In courts and gilded roofs.

To HARBOUR, v. a. To entertain; to permit to reside.—My lady bids me tell you, that though the harbours you as her uncle, she's nothing allied to your disorders. Shakespeare.

Let not your gentle breath harbour one thought Of outrage from the king.

To shelter; to secure.—Harbour yourself this night in this castle: this country is very dangerous for murthering thieves to truft a sleeping life among them. Sidney.

HARBOURAGE, f. [herbergage, Fr. from harbour.] Shelter. Entertainment. Let in us, your king, whose labour'd spirits, For fear of this action of swift fpace, Crave harbourage within your city wall. Shakespeare.

HARBOURER, f. One that entertains another.

HARBOURING, f. The act of entertaining or sheltering.

HARBOURLESS, adj. Wanting harbour; being without lodging; without shelter.

HARBURG. See HAARBURG.

HARBURG, a town and castle of Germany, in the territory of Eichsfeld; now forming part of the department of the Harz, in the new kingdom of Westphalia: nine miles south-west of St. Pillar, and about three leagues north-east of Bernburg.

HARCOURT, a town, in the department of the Eure, and chief place of a canton, in the district of Bernay: three leagues north-west of Bernay, and five north-west of Evreux.

HARCOURT LE BOIS HALBONT, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Falaise: three leagues and three quarters north-west of Falaise and four south of Caen.

HARD, adj. [hear, Sax. hard, Duth.] Firm; resist penetration or separation; not soft; not easy to be pierced or broken.

Repel you there, while I to the hard house,

More hard than is the stone whereof 'tis made.'—Which even but now, demanding after you, Denied me to come in. Shakespeare.

Difficult; not easy to the intellect,—The hard causes they brought unto Moses; but very small matters they judged themselves. Exodus.

'Tis hard to say if Clymene were mov'd.

More by his pray'r, whom the fo dearly lov'd,

Or more with fury hurl'd.'—Dryden.

Difficult of accomplishment, full of difficulties.—Is anything too hard for the Lord? Genesis.

The love and pious duty which you pay

Have past'd the perils of so hard a way.'—Dryden.

Painful; diftressful; laborious action or suffering.—Ralph travelled, and the had hard labour. Genesis.

When Sebastian weeps, his tears Come harder than his blood. Dryden.

Cruel; oppressive; rigorous; as, a hard heart.—A lots of one third of their citizes by taxes will be a very hard cafe upon a great number of people. Locke.

Whom fearc my ſleep, and crarce my painful plough, The needful aids of human life allow;—So wretched is thy fon, fo hard a mother thou. Dryden.

Sour; rough; fervere.—Rough unovernable paffions hurry men on to fay or do very hard or offensive things. Atterbury.

Infensible; inflexible:—Powerful; forcible.—A difputant, capable of. Burnet.

As thou lovet me, do him not that wrong,

As thou lov'lst me, do him not that wrong,—To bear a hard opinion of his truth. Shakespeare.

If by chance succed

In what I write, and that's a chance indeed,

Know I am not fo flupid or fo hard,

Not to feel praife, or fame's deferv'd reward. Dryden.

If by chance succed

In what I write, and that's a chance indeed,

Know I am not so flupid or so hard,

Not to feel praise, or fame's deserved reward. Dryden.
harder than even the marble itself. Dryden.—Not plentiful; not prosperous.—There are bonfires decreed; and, if the times had not been hard, my billet should have burnt too. Dryden.—Avaricious; faultily sparing.

HARD, a. [hards, old Germ.] Close; near; often with by.—Abimelech went hard unto the door of the tower, to burn it with fire. Judges.

Hard, a. [hard], adj. Disobedient to the rein; not sensible of the bit; apt to run riot, and transgress the goal. Dryden.

HARD MEAT, f. See CARPINUS.

HARD-BEAM TREE. See CARPINUS.

HARD-BOUND, adj. Colive.

He writes to make his barrenness appear, and it rains from hard-bound brains eight lines a-year. Pope.

HARD-FAVoured, f. Coarse of feature; harsh of countenance.—When Vulcan came into the world, his heart did hide. Dryden.

When the blast of war blows in your ears, Stiffen the sinews, summon up the blood, Dryden.

HARD-GRASS, f. See DACTYLIS.

HARD-HANDED, adj. Coarse; mechanic; one that has hands hard with labor:—Hard-handed men that work in Athens here, which never labour’d in their minds till now. Addison.

HARD-HEAD, f. Clash of heads; manner of fighting in which the combatants dash their heads together. —I have been at hard-head with your butting citizens; I have roared your head, I have dispersed them. Dryden.

HARD-HEARTEDNESS, f. Cruelty; want of tenderness; want of compatiion. —How black and base a vice ingratitude is, may be seen in those vices which it is always in combination with, pride and hard-heartedness, or want of compatiion. South.

HARD-LABOURED, a. Elaborate; studied; diligently wrought:—How cheerfully the hawkers cry a fatire, and the gentry buy! While my hard-laboured poems pines, unfold upon the printer’s lines. Spoff.

HARD-MOUTHED, adj. Disobedient to the rein; not sensible of the bit:—’Tis time my hard-mouth’d couriers to controul, apt to run riot, and transgress the goal. Dryden.

HARD MEAT, f. For hores, hay and oats. Vol. IX. No. 579.

HARDENS, a. A fee term, in a situation close to the side of the ship.

HARDAN, a river of Germany, in Lower Saxony, which runs into the Ilmenau, near Uitza, in the principalitv of Luneburg-Zell.

HARDANGER, mountains in Norway, in the province of Bergen; sixty miles east of Bergen.

HARDANGER, (Gulf of), a bay of the North Sea, on the coast of Norway. Lat. 59. 50. N. Lon. 6. E. Greenwich.

HARDAWATHER, a. Close to the weather side of the town.

HARDBERG, a town of Germany, in the district of Stidia; ten miles south-south-west of Fridberg, and fifty-two south of Vienna. Lat. 47. 32. N. Lon. 33. 51. E. Ferro.

HARDEGSEN, a town of Germany, with a considerable manufacture of leather; ten miles north-west of Gottingen.

HARDEHAUSEN, a town of Germany, in the circle of Westphalia, and bishopric of Paderborn; five miles north-west of Warburg.

To HARDEN, v. a. To grow hard.—The powder of leadstone and flint, by the addition of whites of eggs and gum-tragacant, made into oalle, will in a few days harden to the hardness of a bone. Bacon.

To HARDEN, v. a. To make hard; to indurate:—Sure he, who first the passage try’d, in harden’d oak his heart did hide, and ribs of iron arm’d his side. Dryden.

To confirm in effrontery; to make impudent.—To confirm in wickedness; to make obdurate.—To make firm; to endue with constancy.—Then shall I have comfort; yea, I would harden myself in sorrow. Job.—One raises the soul and hardens it to virtue; the other softens it again, and unbends it to vice. Dryden.

HARDENBERG, or HARDENBURG, a town of Overijssel, situated on the Vecht, first surrounded with walls in the year 1355, by John d’Arkel, bishop of Utrecht; ten miles south-west of Covorden.

HARDENBERG, or HARDENBERG, or HARDENBERG, a town of United America, in the state of Kentucky; eighty two miles south-south-west of Frankfort. 

HARDFARCK, a seaport town of Guelderland; situated on the Zuyder See. It was only a village before 1503, when Other, burned the Cripples, surrounded it with walls. It was formerly considered as one of the Haar-towns. In 1503, the whole was burnt down, except five or six houes; but was soon afterwards rebuilt, and is now a populous town, with an university, founded in 1618. It had five gates, three towards the land, and two towards the two Sea. In 1528, Charles d’ Egmont, the late duke of Guelders, laid siege to it, but was at that time obliged to retire. Three years after, he took it by surprize. In 1532, it was retaken by comte
de Buren, for the Charles V. and in 1572, the comte de Bergh took possession of it for the confederates. In 1672, the French made themselves masters of it, and abandoned it two years after; but not before they had destroyed the fortifications. The church of St. Martin is much admired for its tower and architecture; the Zuyder See has made considerable encroachments at different times, which obliges them to keep the town defended with dykes: twenty-five miles north-east of Utrecht, and nineteen west of Deventer. Lat. 52° 22'. N. Lon. 23° 5'. E. Ferro.

HARDI (Alexander), a French poet, born at Paris in the reign of Henry IV., and died about 1630. He was the most copious dramatic writer France ever produced; the number of his pieces being estimated at six hundred. Fertility of invention, rather than literary acumen, was his great quality; and he is praised for having adopted the true style of dramatic poetry, and written in heroic verse, though rude and unpolished. Before the time of Cornelle, he was acquainted with the principal French tragedian. His select works are published in 5 vols. 8vo.

HARDIRED, adj. Emboldened; encouraged. Obsolate.

HARDIHEAD, or HARDIMENT, [French.] In music books, with a treatise on French Poetry and Rhetoric, 3 vols. 12mo. and an Universal History, 18 vols. 12mo. to which M. Linguet added two more. He had the office of keeper of the Royal Library, and died in 1766. He wrote several papers in the Memoirs of the Academy of Inscriptions.

HARDISLEBEN, a town of Germany, in the circle of Upper Saxony, and principality of Weimar: two miles north of Buttfadt.

HARDLY, adv. With difficulty; not easily. God had delivered a law as sharp as the two-edged sword, piercing the very closest and most inaccessible corners of the heart, which the law of nature can hardly, human laws by no means, possibly reach unto. Hooker. Recov'ring hardly what he lost before, His right endears it much, his purchase more. Dryden.

Scarcely; scant; not lightly; with no likelihood. The fish that once was caught, new bait will hardly bite. Spens.

They are worn, lord consul, so That we shall hardly in our ages see Their banners wave again. Shakespeare.

Almost not; barely:

The wand'ring breath was on the wing to part, Weak was the pulse, and hardly heav'd the heart. Dryden.

Grudgingly; as an injury:

If I unwittingly Have aught committed that is hardly borne By any in this preference, I desire To reconcile me. Shakespeare.

Severely; unfavourably. If there are some reasons inducing you to think hardly of our laws, are those reasons demonstrative, are they necessary, or mere possibilities only? Hooker.—Rigorously; oppressively. Many men believed that he was hardly dealt with. Clarendon. Unwelcomingly; harshly. Such information comes very hardly and harshly to a grown man; and, however softened, goes but ill down. Locke. Not lightly; not tenderly; not delicately:

Heav'n was her canopy; bare earth her bed, So hardly lodg'd. Dryden.

HARD'MARK, a town of Norway, in the diocese of Christianfand: eleven miles south-west of Christianfand.

HARDNESS, f. Durity; power of resistance in bodies. —Hardness is a firm cohesion of the parts of matter that make up masses of a sensible bulk, so that the whole does not easily change its figure. Locke. From the various combinations of these corpuses happen all the varieties
learned world with a new edition of the orations of Hardocks, Shakef. With his father was a bookfeller. At Quimper-Corentin, where his father was a bookfeller. He studied the law in the Middle Temple; and, being called to the bar in 1714, soon be¬ came extremely eminent in his profession. In the same year he published Differtations on Ancient Medals. In 1685 he published, for the use of the dauphin, an edition of Pliny the naturalist, of which he gave a second edition in 1723, in several vols. folio. He next published the Systern for which he became so famous, in his Chronologia ex Nummis Antiquis refi- tuta, 410, 1697. Here he attempts to prove, that all the works attributed to the ancients, are the fabrication of some monks in the thirteenth century, with the exception only of the works of Cicero, Pliny's Natural History, Virgil's Georgics, Horace's Epistles and Satires, and a very few more. An hypothesis so adverse to found sense and good taste, was received with great indigna¬ tion by the learned of every denomination; yet, though forced to a retractation by the Jesuits, he remained attached to his system as long as he lived. Such, however, was the opinion of his learning, that the French clergy employed him with an annual pension in the preparation of a new edition of the Councils, which appeared from the Louvre prefs in 12 vols. folio, 1715. He afterwards engaged in a controversy against Courayer, on the validity of the ordinances of the English church. He published a collection of pieces left by him under the title of Opera Varia. A Commentary on the New Testament, published at Amsterdam in 1741, folio, and in 1765 there appeared at London an octavo volume, entitled J. Har¬ dock and Coacotuma veterum scripturum Protestantum, which displays the principles of his paradoxical system relative to the ancients.

HAR'DOCK, f. The refuge or coarer part of flax. HAR'KID, f. Injury; oppression. They are ripe for a peace, to enjoy what we have conquered for them, and to; we, to recover the effects of their hardship upon us. Swift.—Inconvenience; fatigue. They were exposed to hardship and penury. Spratt.

In journeys or at home, in war or peace, hardship many, many fall by cafe. Prior.

HARD'WARE, m. Manufactures of metal. HARD'WAREMAN, m. A maker or seller of metal- line manufactures.

HARD'WICK, a township of the American States, in Caledonia county, Vermont.

HARD'WICK, a township of the American States, in Worceelfer county, Massachusetts, twenty-five miles north-west of Worceiler, and seventy fourth-west of Boston.

HARD'WICK, a townshiip of the American States, in Caledonia county, Vermont.

HARD'WICK, a township of the American States, in Georgia, at the mouth of Ogeechee river, and about sixteen miles south-west of Savannah. It has lately been made a port of entry.

HARD'WICK (Philip Yorke, earl of), the illu¬ trious lord chancellor of England, born at Dover in Kent, December 1, 1690; and educated under Mr. Samuel Morland, of Bethnal-green, in classical and general learning, which he ever cultivated amidst his highest employments. He studied the law in the Middle Temple; and, being called to the bar in 1714, soon became extremely eminent in his profession. In 1718, he sat in parliament as member for Lewes in Suffolk; and, in the two successive parliaments, for Seaford. March 17, 1720, he was promoted to the office of lord chancellor, by the recommendation of the lord chancellor Parker: an obligation which he never forgot, since he testified an indelible sense of it by every mark of personal regard and affection. The trial of Mr. Lay in
the court of King's-bench for high treason, November 1723, gave him an opportunity of disclosing his abilities; his reply, in which he summed up late at night the evidence against the prisoner, and answered all the topics of defence, being justly admired as one of the ablest performances of that kind extant. About the same time, he gained much reputation in parliament, by opening the bill against Kelly, who had been principally concerned in bishop Atterbury's plot, as his secretary. February 1723-4, he was appointed attorney-general; he gained much reputation in parliament, by opening his reply, in which he summed up late at night the evidence of the court of King's-bench for high treason, November 1723, of which the two vacancies of the chancery and king's-bench. The integrity and abilities with which lord Hardwicke presided in the court of chancery, during the space of almost twenty years, appears from this remarkable circunstance, that only three of his decrees were appealed from, and even those were afterwards affirmed by the house of lords. After he had executed that high office about seventeen years, in times and circumstances of accumulated difficulty and danger, and had twice been called to the exercise of the office of lord high steward, on the trials of peers concerned in the rebellion; he was, April 1754, advanced to the rank of an earl of Great Britain, with the titles of viscount Royton, and earl of Hardwicke. This honour was conferred unasked, by his sovereign, who treated him through the whole of his reign with particular regard and confidence, and always spoke of him in a manner which showed that he felt as high a veneration for the house as on the minister. His resignation of the great seal, in November 1756, gave an universal concern to the nation, however divided at that time in politics. But he still continued to serve the public in a more private station; at council, at the house of lords, and upon every occasion where the course of public business required it, with the same affiduity as when he filled one of the highest offices in the state. He always feared and defended the true principles on which the laws and constitution of his country; this rendered him as tender of the just prerogatives invested in the crown, for the benefit of the whole, as watchful to prevent the least inroad upon the liberty of the subject. The part which he acted in planning, introducing, and supporting, the '4 Bill for aboliishing the heretical Jurisdictions in Scotland,' and the share which he took, beyond what his department required of him, in framing and promoting the other bills relating to that country, arose from his zeal to the protestant succession, his concern for the general happiness and improvement of the kingdom, and for the tranquility of his majesty's limited monarchy; which were the governing principles of his political conduct through life. And thefe, and other bills which might be mentioned, were strong proofs of his talents as a legislator. In judicature, his firmness and dignity were evidently derived from his consummate knowledge and talents; and the mildness and humanity which he charmed by his eloquence, from the bed of his heart. He was wonderfully happy in his manner of debating causes upon the bench. His extraordinary dispatch of the business of the court of chancery, increased as it was in his time, beyond what had been known in any former, was an advantage to the suitors, inferior only to that arising from the acknowledged equity, perspicuity, and precision, of his decrees. The manner in which he presided in the house of lords, added order and dignity to that assembly, and expedition to the business transacted in it. His talents, as a speaker in the senate as well as on the bench, were universally admired: he spoke with a natural and manly eloquence, without false ornament or personal invective; and, when he acquiesced in his colleagues' decisions, in the same manner. The most apposite cases and examples which the subject would allow, his manner was graceful and affecting; modest, yet commanding; his voice peculiarly clear and harmonious, and even loud and strong. With these talents for public speaking, the integrity of his character gave a lustre to his eloquence, which those who opposed him never doubted; and authority to the laws which he administered. His attachment to the national church was accompanied with a full conviction, that a tender regard to the rights of conscience, and a temper of lenity and moderation, are not only right in themselves, but most conducive in their confequences to the honour and interest of the crown. The strongest recommendation to him of the clergy, to the ecclesiastical prelumptions in his hands, was the interest which the decrees were to the general interest of his profession. And that respectable body owes a particular obligation to his lordship, and his predecessor lord Talbot, for the opposition which they gave in the house of lords to the '4 Act for the more easy recovery of Tithes, Church-rates, and other ecclesiastical Dues, from the People called Quakers,' which might have proved of dangerous consequences to the rights and property of the clergy; though it had passed the other house, and was known to be powerfully supported. Many facts and anecdotes which do him honour may be recollected and set down, when remembrances, partialities, and contests, are forgotten. The animableness of his manners, and his engaging address, rendered him as much beloved by those who had access to him as friends, as he was admired for his great talents by the whole nation. His constitution, in the earlier part of his life, did not seem to promise so much health and vigour as he afterwards enjoyed, for a longer period than usually falls to the share of men of more robust habit of body. But his care to guard against any exertion, and to secure his health and vigour, and the laws and constitution of his country; this rendered him as tender of the just prerogatives invested in the crown, for the benefit of the whole, as watchful to prevent the least inroad upon the liberty of the subject. The part which he acted in planning, introducing,
and digested. Till the latter end of his seventy-third year, he preferred the appearance and vivacity of youth in his countenance, in which the characters of dignity and amiablenesse were remarkably united: and he supported, and niece of lord-chancellor Sommers.

ferred to the two, who dare venture to differ from the received opinions of their country? Locke.

Could thirst of vengeance, and desire of fame, Excite the female breast with martial flame? And shall not love's diviner pow'r infpire More hardy virtue, and more generous fire? Prior.

Strong; hard; firm. —Is a confident of his present flate. —An unwholesome blast may make in pieces his hardy fabric. South. —Confident; impudent; viciously stubborn.

HARDY, a county of the American States, in Virginia, bounded north by Hampshire. It is about forty miles long, and forty in breadth, and contains 7336 inhabitants, including 369 slaves. Chief town, Moorfield.

HARDY, adj. [hardi, Fr.] Bold; brave; stout; daring; resolute. —Who is there hardy enough to contend with the reproach which is prepared for thoes, who dare venture to differ from the received opinions of their country? Locke.

HARE (Francis), an English prelate in the eighteenth century; but the place of whose birth is uncertain. He received his classical education at Eton; whence he was sent to King's-college, Cambridge, of which he was afterwards made a fellow, and took the degree of doctor of divinity. In 1711 he was promoted to the deanery of Worcester; and while he held that preferment, he became an auxiliary to doctors Snape, Sherlock, Potter, &c. in the famous Bangorian controversy. From the deanery of Worcester he was removed to that of St. Paul's; and in 1727 was advanced to the see of St. Albans. In 1731 he was made a fellow, and took the degree of doctor of divinity. the head of the tide-waters of Bush river, between Bingham's and James's runs; the former separating it from Abington. It is rather falling to decay since the courts of justice have been removed to Belle-Air; nine miles south-east of Belle-Air, and twenty-five north-east-by-east of Brixen.

HARG, a sea-port of Sweden, in the province of Upland: thirty miles north-east of Upal.

HARGÉNOW, a town of Germany, in the circle of Lower Saxony, and duchy of Mecklenburg: ten miles south-west of Schwerin.

Hauen in 1645. It is about one hundred miles in length, and from forty to fifty in breadth. It abounds in mines and woods; and consequently agriculture is not much practised here. Its pastures, however, are so excellent, that the inhabitants carry on a very advantageous trade in horned cattle. Its rivers and lakes, like all the rest in the country, abound in fish. The inhabitants subsist by grazing, hunting, and fishing; and sell a great quantity of cheese, which is much esteemed. They maintain no folders in this province; and several places among the mountains are inhabited by Lappers.

HARIER, f. A dog for hunting hares. See the article Hunting.

HARIM, [Hebrew.] A man's name.

HARING, a town of Germany, in the bishopric of Brixen: six miles south-west of Brixen.

HARPH, [Hebrew.] A man's name.

To HARK, v. n. [Contracted from hearken.] To listen: The king, To me inveterate, harks my brother's suit. Shakespeare.

HARK, interj. [It is originally imperative of the verb hark.] Lift! hear! listen!—What harmony is this? My good friends, hark! Shakespeare.

Hark! methinks the roar that late pursued me, Sinks like the murmurs of a falling wind. Rowe. To HARK'KEN, v. a. To hear by listening: Thence forth the path into his dreadfull den, Where nought but darkness entered, there, Nor creature lived, but some little, whisp'ring, and soft groaning found. Spen'ser.

HARL, f. The filaments of flax. Any filamentous substance. The general fort are wicker hives, made of privet, willow, or harl, daubed with cow-dung. Mortimer.

HARLE, a river of Germany, in the province of Lower Saxony, and county of East Friesland, which rises three miles south-south-west of Haren, and from forty to fifty in breadth. It abounds in mines and woods; and consequently agriculture is not much practised here. Its pastures, however, are so excellent, that the inhabitants carry on a very advantageous trade in horned cattle. Its rivers and lakes, like all the rest in the country, abound in fish. The inhabitants subsist by grazing, hunting, and fishing; and sell a great quantity of cheese, which is much esteemed. They maintain no folders in this province; and several places among the mountains are inhabited by Lappers.

HARLEQUIN, f. [This name is said to have been given by Francis I, of France, to a buffoon, in ridicule of his enemy Charles le petit. Menage derives it more probably from a famous comedian that frequented Mr. Harley's house, whom his friends called Harlequin, little Harley. Trevo.] A buffoon who plays tricks to divert the populace. In pantomime, it is the principal character; and is usually distinguished by a party-coloured dress, with a buffoon for an attendant. The joy of a king for a victory, must not be like that of a harlequin upon a letter from his mistress. Dryden.

The man in graver tragic known, Though his best part long since was done, Still on the stage desires to marry; And he who play'd the harlequin, After the jeft still loads the scene, Unwilling to retire, though weary. Prior.

HARLEQUINSHIP, f. The office or employment of a harlequin. Bailey.

HARLESTON, a small town in the county of Norfolk, sixteen miles from Norwich, and 112 from London. It has a bridge over the Waveney. It has a market on Wednesdays, and fairs July 5 and September 9.

HARLEY (Robert), earl of Oxford and Mortimer, eldest son of Sir Edward Harley, born in 1661. At the revolution, Sir Edward and his son raised a troop of horse at their own expense; and after the accession of King William and Queen Mary, he obtained a seat in parliament. In 1703, he was chosen speaker of the house of commons; in 1704, he was sworn of Queen Anne's privy council, and the same year made secretary of state; in 1706, he acted as one of the commissioners for the treaty of Union; and in 1710, was appointed a commissioner of the treasury, and chancellor and under-treasurer of the exchequer. A daring attempt was made on his life, March 8, 1711, by the marquis of Guiscard, a French papist; who, when under an examination before a committee of the privy council, stabbed him with a penknife. Of this wound, however, he soon recovered; and was the same year created earl of Oxford, and lord high-treasurer, which office he resigned just before the queen's death. He was impeached of high treason in 1713, and committed to the Tower, but was cleared by a jury. He died in 1744. His character has been variously represented, but cannot be here discussed. He was not only an encourager of literature, but at immense labour and expense made that most valuable collection of useful and curious manuscripts, called the Harleian Collection; which was conducted upon the plan of the great Sir Robert Cotton. He published his first considerable collection in August 1725, and in less than ten years he got together near 3500 rare and curious manuscripts. Soon after this, the celebrated Dr. George Hicks, Mr. Anfis garter king at arms, bishop Nicholl, and many other eminent antiquaries, not only offered him their assistance in procuring manuscripts, but presented him with several volumes of very valuable. He was encouraged to perseverance by his success, he kept many persons employed in purchasing manuscripts for him abroad, giving them written instructions for their conduct. By these means the manuscript library was, in 1721, increased to near six thousand books, fourteen thousand original charters, and five hundred rolls. On the 27th of May 1724, lord Oxford died; but his son Edward who succeeded to his honours and estate, still further enlarged the collection; so that when he died, June 16th, 1741, it consisted of eight thousand volumes, several of them containing distinct and independent treaties, besides many papers which have been since bound up in volumes; and above forty thousand original rolls, charters, letters patent, grants, and other deeds and instruments,
The principal design of making this collection was the establishment of a manuscript English historical library, and the refusing from destruction such national records as had eluded the diligence of preceding collectors; but Lord Oxford's plan was more extensive; for his collection abounds also with curious manuscripts in every science. This collection is now in the British Museum; and an enumeration of its contents may be seen in the Annual Register, vol. vi. p. 142, &c.

HARLING, or EAST HARLING, a town in the county of Norfolk, which stands on a rivulet, between Thetford and Buckenham, eighty-eight miles from London. Its market, on Thursdays, is chiefly for linen yarn and linen cloth; and the fairs are May 4, and Oct. 21. Middle Harling, and West Harling, are situated at a small distance from the above.

HARLINGEN, a seaport town of Friesland, on the Zuydser See. In 1496, the inhabitants of Groningen built a castle here; and fourteen years afterwards, Albert duke of Saxony built another, stronger than the first. It is not exactly known when it was surrounded with walls; but certain it is, that in the years 1533, and 1579, the city was considerably enlarged by the care of William prince of Orange. This place is now fortified with the same strength as before, and is situated on the adjacent country being very easily laid under water. There have been some strong dykes raised here to stop the fury of the ocean. The city is square, the streets handsome, straight, and clean, with canals in the centre of them. It is adorned with five gates, four towards the land, and one towards the sea. Though the harbour before it, vessels of great burden must lie oft at a little wharf. Others from the name of Horlo, concubine of Robert duke of Normandy, and mother of William the Conqueror. Horlot is used in Chaucer for a low male drudge. 1 A tramet; a woman of ill-fame. They help the by such aids as geese and harlots. Ben Jonson.

The barbarous harlots crowd the public place; Go, fools, and purchase an unclean embrace. Dryden.

Harlots were tolerated amongst the Jews, Greeks, and Romans; and according to Terentius, the use of them was not deemed immoral. Fornication indeed was prohibited under severe penalties; but these the Jews explained as extending only to women of their own nation. The public fows were therefore stocked with foreign courtesans, who seem to have been taken under the protection of the government. Hence appears the reason why the etiastic frangia woman is often found to signify a harlot. They at first wore veils; but by degrees their modesty was entirely put aside, and they went abroad bare-faced. Amongst the Jews, the harlots used to sit by the way-sides, or at the gates or entrance of cities; at Athens they frequented the cemeteries, and in foreign cities they were compelled to distinguish themselves by their dresses, from other women. Corinth was a remarkable nursery of harlots, and gave birth to the celebrated Lais. Their accomplishments were oftentimes great, in all the polite and elegant parts of female education, viz. philosophy, dancing, singing, rhetoric, &c. Alcina, the mistress of Pericles, was admired by Socrates for her learning. The more accomplished women of this description frequently amassed large fortunes; a remarkable instance of which is given in Phryne, who offered to rebuild the walls of Thebes, when destroyed by Alexander, on condition that they would perpetuate her memory by an inscription. Prostitutes at Rome were obliged to fix a bill over their house. The Romans forbade them to change their names, after they had lived thirty years; but they were permitted to assume another, indicating their profession. It was also customary for them to change their names, after they had signified to the priest the intention of leading such a kind of life: this they did, because their trade was incompatible with their birth and condition; but they renounced their family names whenever they quitted their licentious mode of living. Women whose grandfathers, fathers, or husbands, had been a Roman knight, were forbidden by the laws to follow the profession of a harlot.

HARLOTTRY, n. The trade of a harlot; fornication; contamination.

From Rome's tribunal, thy harangues prevail
'Gainst harlotry, while thou art clad so thin. Dryden.

A name of contempt for a woman: A peevish self-will'd harlotry.

That no persuasion can do good upon. Shakespeare.

HARLOW, a small town in the county of Essex, situated on the west side of the Rodings towards Hertfordshire, distant twenty-four miles from London. The church was burnt down in 1711, when the workmen in digging on the foundation of the very thing found an iron pole and a botany, and a silver plate, with dedication, Sanctus S. Catharina. Here are almshouses for poor widows, besides other charities. The market is held
held on Wednesdays: fairs, Nov. 28 and 29; and one near the town, on the 9th of September, called Harlow
held on Wednesdays: fairs, Nov. 28 and 29; and one

We, ignorant of ourselves,

beg often our own harms, which the wise Powers
deny us for our good.

To harm, v. a. To hurt; to injure.—After their
young are hatched, they brood them under their wings,
left the cold, and sometimes the heat, should harm them.

Ray.

What fene had I of her flo'n hours of life?

I saw it, not; thought it not, it harmed not me. Shaksp.

"Harm watch harm catch."—This emphatic pro-

verb is addressed to the consideration of them, who, from

flight and trivial causes, watch for opportunities of in-

jurying their neighbour; and who, as experience shows,
often fall into the pit they dig for others. The Latins
say, Et si parat mahu, qui alteri parat. The Ger-

man, Wer fene anvernag zwingelbe made; He who hunts another,
tires himself.

Harm-doing, f. The act of injuring another:

Shakespeare.

Harmal, f. In botany. See Peganum.

Harm's station, a fort of the American States,
in Kentucky, on the east side of the west branch of
Big Sandy river. On the opposite side of this branch
is the noted Great Salt Spring. Harm's Station is
about twenty miles south of Vancouver's fort.

Harmansford, a town of Germany, in the du-

cny of Stirl: two miles south-east of Graz.

Harmer (Thomas), an English nonconformist di-

vine, born at Norwich in 1715. Having early dis-
covered an inclination for the profession of the Christian
ministry among the protestant dissenters, he was placed
under proper classical instructors, and, after he had made
a considerable proficiency in grammar learning, he de-

voted himself to the task of acquiring a competent know-

ledge of the Latin, Greek, and Hebrew, languages, in
each of which he became a critic. But the favourite ob-
jective of his pursuit was oriental science, which he ap-
plied to the illustration of the sacred Scriptures. Ob-
serving a striking conformity between the present cus-
toms of the eastern nations and those of the ancients, as
alluded to in various passages of Scripture, he conceived
a wish, at a very early period, of making extracts of such
passages in books of travels and voyages appro-
priated to him to furnish a key to many parts of Holy
Writ. In 1764, he therefore presented to the public the
first fruits of these labours, in Observations on divers
Passages of Scripture, placing many of them in a light
altogether new. The favourable reception which this
work met with encouraged the author to publish a new
and enlarged edition of it in 1775. In his additions to this impri-
mon, he was indebted to the manuscript papers of the celebrated sir John Chardin, with
which he had been furnished, through the interest of the learned Dr. Bow, bishop of London. The utility of his design, and the able manner in which it was exec-
uted, procured him also the correspondence of many
other learned men. Animated by the praise paid to his work, and desirous of rendering his work still more perfect, he
continued indefatigable in further researches, till he had
collected materials for two additional volumes, which
were given to the public in 1757. On the 27th of No-

vember in the following year, after having passed the
winter in perfect health, he awoke early in the
morning complaining of pain; and, before new year
approached, he expired. Besides this grand work,
he published, 1. The Outlines of a new Commentary
on Solomon's Song, drawn by the Help of Instructions
from the Holy, 1768, 8vo. 2. An Account of the Jew-
ish Doctrine of the Resurrection of the Dead. 3. Re-
marks on the ancient and present State of the Congre-
sational Churches of Norfolk and Suffolk. 4. An Ad-
dress to those who are religiously disposed, as a per-suasion
to church fellowship; together with several single
sermons.

Harmesias, f. In botany. See Brownea.

Harmful, adj. Hurtful; mischievous; noxious;
detrimental. The earth brought forth dear fruit and
food for man, without any mixture of harmful quality,
Raleigh.

For flax and oats will burn the tender field,
And sleepy poppies harmful harvests yield.

Dryden.

Harmfully, adv. Hurtfully; piously; detrimentally.—A scholar is better occupied in playing or scripture, than spending his time, not only vainly but
harmfully, in such kind of exercise. Aesop.
HARMFULNESS, f. Hurtfulnes5; mischiefousnes5; noxiousnes5.

HARMLESS, a. f. Innocent; innoxious; not hurtful.

She, like harm'fis lighting, throws her eye On him, her brothers, me, her master; hating Each objefl to you, a joy. Shakespear.

Unhurt, undamaged.—The shipwright will be careful to gain by his labour, or at least to love himself harmles', and therefore suit his work slightly, according to a fit price. Raleigh.

HARM'LESSLY, ad. Innocently; without hurt; without crime.—Bullets batter the walls which stand inflexible, but fall harmlessly into wood or feathers. De¬
cay. Pope.

HARM'LESSNESS, f. Innocence; freedom from tendency to injury or hurt: When, through taste'les5 flat humility, Indough-bak'd men some harmles'fes we see, 'Tis but his pligen that's virtuous, and not he. Donne.

HARMO'DIUS, a man's name; a famous Athenian, instrumental in delivering his country from the tyranny of Pisistratus. See the article Greece, vol. viii.

HAR'MONIA, in mythology, the daughter of Mars and Venus, whom Cadmus is said to have married. Bochart imagines that she had her name from mount Hermon: but, says Mr. Bryant, she seems to have been associated with Hermes, and the latter nurfed the child. She is from hence fifted by Nonnus, Ἀμονα. And, when Venus is represented in the allegory as making her a visit, she is said to go so; Ἐφοιομεν Ἀμονας παραμιλήσων. In some of the Orphic verses the she is not only represented as a deity, but as the light of the world:

Ἀμονα, κύριοι φανέροι, καὶ σέβει Δαιμόν.

Harmonia was supposed to have been a perfonage from whom all knowledge was derived. On this account the books of science were called κύρια Ἀμονα, the books of Harmonia, as well as the books of Hermes. These were four in number, of which Nonnus gives a curious account, and says, that they contained matter of wonderful antiquity. The drift of them is said to have been coeval with the world:

Πρὸς κύριοι ὀπτέρως δηληγοι κύριοι, ἐν ταῖς παραδικαίοις, ὡσ τοιχίνωσοι Οΐκον ἱερόν.

From hence we find, that Harmon, or Harmonia, was a deity, to whom the first writing is ascribed. The fame is the case in Greece. The inventors of harpsichords are also ascribed to Harmonia, Taut, or Thoth. Cadmus is said not only to have brought letters into Greece, but to have invented them. From hence we may conclude, that under the characters of Hermon, Hermes, Taut, Thoth, and Cadmus, one perfon is alluded to.

The deity, called by the Greeks Harmonia, was introduced among the Canaanites very early by the people of Egypt; and was worshipped in Sidon, and the adjacent country, by the name of Baal Hermon. Nonnus gives an account of a robe or pharus, which Harmonia is supposed to have worn, when she was visited by the godesses of beauty. Upon it are delineated the earth, the heavens, and the stars; the sea also and the rivers were reprefented: and the whole was at the bottom surrounded by the ocean. Mr. Bryant concludes that all this relates to a painting either at Sidon or Berythus, which was delineated in a tower or temple sacred to Hermon.

HARMONIC, or HARMONICAL, adj. [ἀμονικός, Gr. harmonique, Fr.] Relating to music; susceptible of musical proportion to each other.—After every three words, note the intervals, for all genes must have half-note to be interpolated. Bacon.—Concordant; musical; proportioned to each other; just properly. Harmonic.

Vol. IX. No. 80.

Musical founds, and discordant founds, are both active and passive; but blackness and darkness are, indeed, but privatives. Bacon.

So wells each wind-pipe; as into its, Harmonic twang of leather, horn, and brafs. Pope.

Harmonic or musical proportion, is that in which the first term is to the third as the difference of the first and second is to the difference of the second and third; or when the first, the third, and the said two differences, are in geometrical proportion. Or, four terms are in harmonic proportion, when the first is to the fourth as the difference of the first and second is to the difference of the third and fourth. Thus, 2, 3, 6, are in harmonic proportion, because 2 : 6 :: 1 : 3. And the four terms, 9, 12, 18, 24, are in harmonic proportion, because 9 : 24 :: 3 : 8. If the proportional terms are continued in the former cafe, they will form an harmonic progression, or series.—See the article Music.

HARMO'NICA, from ἀμονικός, Gr. harmony.] The instrument popularly known by the name of Musical Glasses. Mr. Pockrich, of Ireland, seems to have been the first who thought of playing tunes formed of the tones of drinking glasses. He collecte'd a number of glasses of different fizes, fixed them near each other on a table, and tuned them by putting water into them, more or less, as each note required. Mr. Delaval, F.R.S. next made an instrument in imitation of that which was contrived by Mr. Pockrich: and from this instrument Dr. Franklin took the hint of contriving the harmonica, which reflects infinite credit on his musical talents and ingenuity.

The glasses for this instrument are blown as nearly as possible in the form of hemispheres, running from small to large in regular proportion, and having each an open neck orocket in the middle. The thickness of the glafs near the brim is about one-tenth of an inch, increasing towards the neck, which in the largest is about an inch deep, and an inch and half wide within; but these dimensions lessen, as the proportions of the glasses diminish, observing that the neck of the smallest should not be shorter than half an inch. The diameter of the largest glass is nine inches, and that of the smallest three inches: between these there are twenty-three gradations of size, differing from each other a quarter of an inch in diameter, for contriving an instrument so intrincate, the glasses must be at least six glasses blown of each size, and out of these thirty-seven glasses (which are sufficient for three octaves with all the semitones) may be found, that will either yield the note required, or one a little sharper, and fitting so well into each other, as to taper regularly from the largest to the smallest. The glasses being chosen, and the note for each glass marked. They are marked upon it with a diamond, they are to be tuned by diminishing the thickness of those that are too sharp, which is done by grinding them round from the neck towards the brim, comparing, by means of a well-tuned harpsichord, the tone drawn from the glass by your finger with the note you want, as founded by the corresponding string of the harpsichord. The number of the instrument is G, a little below the reach of a common voice, and the highest G, including three complete octaves: and they are distinguished by painting the apparent parts of the glasses within fide, every femi-tone white, and the other notes of the octave with the seven prismatic colours: so that glases of the same colours (the white excepted) are always octaves to each other.

When the glasses are tuned, they are to be fixed on a round spindle of hard iron, an inch in diameter at the thickest end, and tapering to a quarter of an inch at the finall. For this purpose, the neck of each glafs is fitted with a cork, projecting a little without the neck; four holes are also made at each glass, corresponding to the dimension of the spindle in that part of it where they are to be fixed. The glasses are all
all placed within one another; the largest on the greatest end of the spindle, with the neck outwards; the next in size is put into the other, leaving about an inch of its brim above the brim of the first; and the others are put on in the same order. From these exposed parts of each glass, the string is drawn, by laying a finger upon one of them as the spindle and glades turn round. The spindle, thus prepared, is fixed horizontally in the middle of a box, and made to turn on brass gudgeons at each end. A square Shank comes from its thickest end through the box, on which Shank a wheel is fixed by a screw: this will serve, like a fly, to make the motion equable, when the spindle is turned by the fingers, or like a spinning-wheel. The wheel is eighteen inches in diameter, and conceals near its circumference about twenty-five pounds of lead; and may be made of mahogany. An ivory pin is fixed near its circumference about twenty-five pounds of lead, will serve, like a fly, to make the motion equable, when the spindle is turned by the fingers, or like a spinning-wheel. The box is over which is put the loop of the firing, that comes up and may be made of mahogany. An ivory pin is fixed near its circumference about twenty-five pounds of lead, will serve, like a fly, to make the motion equable, when the spindle is turned by the fingers, or like a spinning-wheel. The motion measured by a gear'd chime. Prior.

To HARMONIZE, n. To agree; to make musical.

HARMONIZING, f. The act of adapting to each other; chiefly used of the parts in a piece of music.

HARMONY, n. [æ'ro'ma'ni. Gr. harmonie, Fr.] The just adaptation of one part to another. —Sure infinite Wisdom must accomplish all its works with concomitant harmony, proportion, and regularity. Churny.

The harmony of things, As well as that of sounds, from discord springs. Denham.

Juft proportion of sound; musical concord. —Harmony is a compound idea, made up of different sounds united. Watts.

The sound Symphonions of ten thousand harps, that tun'd Angelic harmonies. Milton.

Concord; correspondent sentiment: I no sooner in my heart divin'd, My heart, which by a secret harmony Still moves with thine, join'd in connexion sweet! Milton.

In the science of music, the words concord and harmony signify the same thing; though custom has made a little difference between them. Concord is the agreeable effect of two sounds in consonance; and harmony the effect of any greater number of agreeable sounds in consonance.

Again, harmony always implies consonance; but concord is also applied to sounds in succession; though never where the terms can agree equally in consonance. The effect of an agreeable succession of several sounds is called melody; as that of an agreeable consonance is called harmony. The ancients seem to have been entirely unacquainted with harmony, the soul of the modern music. In all their explanations of the melopoeia, they say not one word of the concert or harmony of parts. We have instances, indeed, of their joining several voices, or instruments, in consonance; but then these were not so joined, as that each had a distinct and proper melody, so making a succession of various concords; but they were either unisons, or octaves, in every note; and all performed the same individual melody, and constituted one concord. When the parts differ, not in the tenor of the whole, but in the different relations of the successions of the successive notes, it is this that constitutes the modern art of harmony. See the article Music.

HARMONY of the SPHERES, that concert which the heavenly bodies produce upon one another, acting at proper intervals. Kepler wrote a large work on the harmony of the world, and particularly on that of the celestial bodies. He first endeavoured to find out some connection between the dimensions of the five regular solids and the intervals of the planetary spheres; and imagining that a cube, inscribed in the sphere of Saturn, would touch by its six planes the sphere of Jupiter, and that the other four regular solids in like manner fitted the interiors that are between the spheres of the other planet, he became persuaded that this was the true reason why the primary planets were precisely six in number, and that the great Author of the world had determined their distances from the sun, the centre of the system, from a regard to this analogy. But afterwards finding that the disposition of the five regular solids amongst the planetary spheres was not agreeable to the intervals between their orbits, he endeavoured to discover other schemes of harmony. For this purpose he compared the motions of some planet at its greatest and least distances, and of the different planets in their several orbits, as they would appear viewed from the sun; and here he fancied that he found a familiarity to the divisions of the octave in music. Lastly, he supposed that these lines were drawn from the earth to each of the planets, and the planets appended to them, or stretched by weights proportional...
to the planets, these lines would then found all the notes in the octave of a musical chord. See his Harmonies; also Maclaurin's View of Newton's Discev, b. i. c. 2.

HAR'NODY, a town of the American States, in Luzerne county, Pennsylvania, close on the line of New York State, and a quarter of a mile north of Scarsaca creek, a water of the east branch of Susquehannah river. Between this and Stockport on Delaware river, distant eighteen miles east-south-east, there is a portage. It is about 140 miles north-by-west of Philadelphia, and 130 north-west of New York. Lat. 41.58. N.

HAR'NESS, or Harnefher, [Hebrew.] A man's name.

HAR'NESS, [s. fr. harneis, Runic; Welfti and Erie, iron.] Armour; defensive furniture of war:

A goodly knight, all drest'd in harnes meet,
That from his head no place appeared to his feet. Spenser.

The traces of draught horses, particularly of carriages of pleasure or state: of other carriages we say Spenser. That from his head no place appeared to his feet.

From the harnes, graze the flow'rly ground. Dryden.

To HARNESS, v. a. To drest in armour;

Full fifty years, harnes'd in ragged steel,
I have endur'd the biting winter's blast. Rowe.

To fix horses in their traces.—Harnes the horses, and up the horsemen, and stand forth with your hamlets. Spenser.

Before the door her iron chariot stood,
All ready harnes'd for journey new. Spenser.

HARNESSING, f. The act of putting on harness; putting on armour.

HAR'NIT, or Arme, a small ifland in the English Channel, about two miles from the ifland of Guernsey, and one from Sark.

HAR'RO, a town of Spain, in Old Caftile, on the Ebro, surrounded with walls. It is situated in a fertile country, and contains seven hundred families, three parishes, and a convent: thirty-two miles north-east of Burgos, and seven north of Calzada.

HAR'RO, or Har'ron, f. In old customs, a hue and cry after felons.

HAR'RAH, [Hebrew.] A man's name.

HAR'RO, [Heb. appointment.] The name of a place.

HAR'RODITE, an inhabitant, of Harod.

HAR'ROAH, [Hebrew.] A man's name.

HAR'RO, a town of Spain, in Old Caftile, on the Ebro, surrounded with walls. It is situated in a fertile country, and contains seven hundred families, three parishes, and a convent: thirty-two miles north-east of Burgos, and seven north of Calzada.

HAR'PATH, a river of United America, in the Tennessee, government, which runs into the Cumberland river fourteen miles south-east of Clarkville.

HARP, f. [harpe, Sax. harpe, Fr.] It is ufed through both the Tentonic and Roman dialects, and has been long in use. Romamique tyra plaudat tibi, Barbarus harpi. Ven. Fort.] A lyre; an instrument ftrung with wire, and commonly ftruck with the finger; and of which there are feveral kinds. See the article Music.

They touch'd their golden harp, and hymning praise'd God and his works.

Milton.

Nor wanted tuneful harp, nor vocal quire,
The mufes fung, Apollo touch'd the lyre. Dryden.

The name of a constellation:

Next shines the harp, and through the liquid skies
The hell, as lighted, firft begins to rife;
Then when sweet Orpheus ftruck, to lifting rocks
He fennes gave, and ears to with'rd oaks. Greek.

To HAR, v. n. [harper, Fr.] To play on the harp.—I heard the voice of harpers harping with their harps. Rev.

The helmed cherubim,
And fworded forifamph,
Are feen in glitt'ring ranks with wings display'd, Harping in loud and solenim quire, with unexpreflive notes to heaven's new-born heir. Milton.

To touch any passion; as, the harper touches a string. To dwell on a subjeæt,—You harp a little too much upon one string. Collier.

Gracious duke,
Harp not on that, nor do not baniʃt reafon
For inequality; but let your reafon serve
To make the truth appear. Shakespeare.

HARPAC'TION, f. In phyfic and furgery, a kind of gum; a platter of brimflone and turpentine. Phillips.

HARPAGUS, a general of Cyrus. He conquered Armenia after he had revolted from Alyaffes, who had cruelly forced him to eat the flesh of his fon, because he had difobeyed his orders in not putting to death the infant Cyrus. Herodotus.

HARPALICE, a woman's name; daughter of Lycurgus.

HARPALUS, an eminent Greek aftronomer, who flourifhed about 430 years before Chrift. He corrected the cycle of eight years, which Cleoftratus of Tenedos had invented, and propofed a new one of nine years, in which he imagined that the fun and moon returned to the fame point. This cycle of Harpalus was followed till about the year 444 before Chrift, when Meton the fon of Paufanias proved it to be erroneous, and published his invention of the Enneadecaeteris, or cycle of nineteen years, which is still in ufe, and called the Golden Number; though, properly fpaking, the golden number is that particular number which shows the year of the cycle with which any given year correfponds. See the article CHRONOLOGY, vol. v. p. 557.

HARPARKEN, a town of France, in the department of the Lower Pyrenees, and chief place of a canton, in the district of Ufairitzar; three leagues and a quarter south-east of Bayonne, and two and half east of Ufairitzar.

HARPATH, a river of United America, in the Tennessee, government, which runs into the Cumberland river fourteen miles south-east of Clarkville.

HARPAX, f. In natural history, a kind of amber.

HARPE, f. A sword like a fcythe; a wood-knife. An old word.

HARPE (John Francis de la), a celebrated writer, born at Paris in 1739; his father was a Swis, and a captain of artillery in the service of France. He had no fortune in profpet, and owed his education to the kindness of the principal of the college d'Harcourt. Young La Harpe carried away the univerfity prizes, and soon distinguished himself by his productions. At the age of twenty-five he gave to the stage his tragedy of Warwick, which met with great succes; but his future effays in the fame way did not anfwer the public expectations; with the exception of Philocletes, translated from Sophocles. The abfence of the female character is a fingular trait in this tragedy; without love, the performance interefts by its noble simplicify, and by bringing to our recollection the high flate of the tragic art in Greece. Every year, besides his tragedies, this writer produced pieces of poetry, and profi effays, which were crowned with the prizes of the different academies. This honour was conferred on his orations on Fenelon, Racine, and

HARPE, f. A sword like a fcythe; a wood-knife. An old word.
that, and Charles V. He had for a long time the charge of the literary part of the Mercure. Having thrown himself a good poet and a good orator, he appeared with great eclat as a critic; he displayed a profound acquaintance with criticism, and a correct taste; of which he had acquired, found principles of taste, and a remarkable talent for discussion, as well as close and forcible reasoning; could he have commanded his passions when treating of his cotemporaries, and had he adopted a style less imperious and decisive, he might have filled with dignity the chair of Quintilian. His powers were considerable, but it was his misfortune greatly to over-rate them. When the revolution broke out, he cherished notions of reform, without carrying them into extremes: but, when the reign of terror taught him that all was capable of being abused; when he saw the ideas of liberty, equality, and justice, become rallying points for the fanatics; and when he had been confined in one of the castles that the Giron was, at last, he was torn with indignation against tyranny, and inspired with zeal for that holy religion which it was attempted to overturn, by ridiculing its worship and proliferating its ministrants. He had been the disciple and great admirer of Voltaire, who had rewarded with eulogiums his attachment to the party of the modern philosophers; he now declared his hatred on the principles in all his writings, from this period to his death. On the 18th Fructidor (4th September) he was condemned to deportation: but he had the good fortune to conceal himself in a secure asylum, and to escape the proscription. He died in the winter of 1803, at the age of sixty-four. M. de Fontanes, in a short and brilliant eulogy on him, says, "Letters and Satires at the Lyceum, of which he has been the editor, have had great eclat as a critic; he displayed a profound acquaintance with criticism, and a correct taste; of which his readers have lost nothing of their vigour, and when his talents had been strengthened and increased by the extraordinary events of the last twelve years. It is known that he had become a profelyte to those useful and considerable opinions on which the focial revolution repose; the most enriched his ideas and his style with new beauties, but they mitigated the sufferings of the latter days. The works of La Harpe have been collected in 6 vols. 8vo. but this edition is very incomplete, and renders it desirable that another should be given to the public."

**HARPEGGIATO, or HARPEGGIO, s. f.** In music, the method of striking the several sounds of a concord so as to be heard distinctly one after another.

**HARPER, s.** A player on the harp.

**Harp,** the method of striking the several sounds of a concord so as to be heard distinctly one after another.

**HARPERSFIELD, a township of the American States, in Otsego county, New York, bounded south-west by Unadilla township, and thirty-two miles south-east of Cooperstown; 153 of its inhabitants are electors. Through this town runs the great post-road from Hudson to Williamsburgh, sixty-two miles west of Hudson city.**

**HARPIUS (Henry), a celebrated mythical writer, born at Herph, a village in Brabant, whence he derived his surname. He embraced the monastic life, and died at Mechlin in 1473. He is claes among the writers of eminence in mystical divinity, and his works have been much admired and read in catholic countries. The principal of them are entitled, Epithalamium, or the Bridal Song; The Golden Directory for the Contemplative; and Eden, or the Terrestrial Paradise of the Contemplative. He also published some other treatises of a similar kind; and some sermons, which were printed after his death, 1630.**

**HARPIES, s. [from Gr. ἀρπίνιος, Gr. ἀρπίνια, Lat.] In fabulous history, rapacious monsters, represented with wings like bats, ears like bears, bodies like vultures, faces like women, and feet and hands hooked like the talons of the condor. Some make them the daughters of Tellus and Oceanus, the earth and ocean; whence, says Ser- vius, it is, that they inhabit an island, half on land and half in water. Valerius Flaccus makes them the daughters of Typhon. There were said to be three harpies, Aello, Orcypete, and Celeno, which last Homer calls Podarge. Hesiod, in his Theogony, ver. 657, only reckons two, Aello and Orcypete, and makes them the daughters of Thaumas and Electra, affirming that they had wings, and went with the rapidity of the wind. Zephyrus begat of them Balios and Xanthus, Achilles's horses. Pherecydes relates, that the Boreades expelled them from the Aegean and Sicilian seas, and pursued them as far as the islands which he calls Plute, and Homer Calydon; and which have since been called the Simphades.

**Volusius, De Idolol. lib. iii. p. 69, thinks, that what the poet has of the harpies has nothing to correspond to the great terrene bats found in the territories of Darien in South America. These animals kill not only birds, but dogs and cats, and prove very troublesome to men. But the ancients knew nothing of these bats. By the harpies, therefore, he thinks, they could mean nothing else but the winds; and that it was on this account they were made daughters of Electra, the daughter of Oceanus. Such is the opinion of the scholiasts of Apollonius, Heciod, and Euthydus. Their names, Aello, Orcypete, Celeno, are supposed to suggest a further proof of this fact.**

Mr. Bryant supposes that the harpies related to the priests of the Sun. They were, he says, denominated from their seat of residence, which was an oracular temple called Harpy, and Hirpi, analogous to Orphi, and Urphi, in other places. The ancient name of a priest was Caten, rendered mistakenly Kris, and Canis. Hence the harpies, who were priests of Ur, are said by Apollonius the Dogs of Jove:

"O οὐραγος, ο ηυσ δηοικος ξιπατης άνθρωπος, μεγαλος Δίος ΚΥΝΑΣ." This term, in the common acceptation, is certainly not applicable to the harpies, either as birds or as winged animals. But this representation was only the fancy of the ancients. They do not seem to have been a set of rapacious persons, who, for their repeated acts of violence and cruelty, were driven out of the country; and hence the degrading epithet of harpy.

**HARPING, s.** The act of playing on the harp; the sound of harpers.

**HARPING-IRON, s.** [from harp, Lat.] A bearded dart with a line fastened to the handle, with which whales are struck and caught; a harpoon.

The boat which on the first assault did go
Struck with a harping-iron the younger Ioe;
Who, when he felt his side so rudely goar'd,
Loud as the sea that nourish'd him he roar'd. Waller.

**HARPINGS, s.** A sea term; the breadth of a ship at the bow; the ends of the bend which are fastened into the stern.

**HARP'L'E, a township of the American States, in Delaware county, Pennsylvania.**

**HARPOCRATES, s.** In mythology, the son of Isis and Osiris. This is an Egyptian deity, represented with his finger applied to his mouth, denoting him to be the god of
of silence. The statue of this idol was fixed at the entrance of most of the Egyptian temples, and he was commonly exhibited under the figure of a young man crowned with an Egyptian mitre, holding in one hand a cornucopia, and in the other the flower lotus, and sometimes bearing a quiver.

HARPOCRATION, a rhetorician of Alexandria, who is supposed to have flourished in the fourth century. He wrote a Lexicon of ten Greek Orators, in which he treats of the magistrates, courts of justice, forms of pleading, &c., and in public festivities, &c. of Attica, and he himself to be a polite and well-informed writer. Of this work, which has reached our times, Maaffaci published an edition, Greek and Latin, with notes, Paris, 1614, 4to. Another edition was given at Leyden, in 1683, 4to, with observations by Valois.

HARPONEER, [harponeer, Fr. from harpoon.] He that throws the harpoon in whale-fishing.

HARPONELLY, a town of Hindoostan, and capital of a district of the same name, in the Myfro country; sixty-five miles north-north-east of Bedanore, and 152 north-north-west of Seringapatam. Lat. 14° 40'. N. Lon. 75° 28'. E. Greenwich.

HARPOON, [harpon, Fr.] A spear or javelin used to strike the whales in the Greenland fishery. The harpoon, which is sometimes called the harping-trom, is furnished with a long staff, having at one end a broad and flat triangular head, sharpened at both edges, so as to penetrate the whale with facility; to the head of this weapon is fastened a long cord, called the whale-line, which lies carelessly coiled in the boat, in such a manner as to run out without being interrupted or entangled. See Whale-Fishery, vol. vii. p. 412.

The Gun-Harpoon is a javelin of the same kind as that above described; but, instead of being cast by a man, it is discharged from a gun, whereby it strikes the whale with greater force, and consequently with more certainty of execution, provided the smoothness of thejecting it itself into the bay together with the island Se-venous wretch; an extortioner: in allusion to the harpies, afterwards by Georgetown; from which it is separated by bafoedagan, and several other small islands, are incor¬porated west-north-west of Hoya.

Kennebeck, and thus form what is called Small Point.

Weltphalia, and county of Hoya; twenty-two miles: which has of late years given place to the piano-forte. See the article Music.—It was Mr. Western's custom to approach it to the distance of ten, fifteen, or twenty, though a timorous creature, will frequently allow a boat to penetrate the whale with facility: to the head of this weapon is fastened a long cord, called the whale-line, which has of late years given place to the piano-forte. See Whale-Fishery, vol. vii. p. 412.

HARP'SWELL, a township of the American States, in Cumberland county, district of Maine, incorporated in 1759, and contains 1071 inhabitants. It is bounded easterly by Georgetown; from which it is separated by a navigable river. Here is a communication opened by a canal, between the waters of Kennebeck river and the sea will admit of proper aim being taken; for in rough weather it cannot be used. In the Transactions of the London Society for the Encouragement of Arts, &c., we have accounts of a number of whales killed in this manner; from whence it appears that the instrument is extremely useful in calm weather, since the whale, though a turgidous creature, will frequently allow a boat to approach it to the distance of ten, fifteen, or twenty, fathoms, all of which distances are within reach of the gun-harpoon, though not within reach of that thrown by the hand. On this account it is justly entitled to the encouragement given to it by that excellent society. Harp, [harp, Fr. An instrument for playing; a stringed instrument, consisting of a body furnished with a series of strings, which is stretched across a frame or back, and played by striking keys; but which has of late years given place to the piano-forte. See the article Music.—It was Mr. Western's custom every afternoon, as soon as he was drunk, to hear his daughter play on the harpsichord, Fielding's Tom Jones.

HARP'STÉDE, a town of Germany, in the circle of Weilphalia, and county of Hoya; twenty-two miles west-north-west of Hoya.

HARRINGTON (Sir John), a celebrated English poet, born about 1661; and was the son of John Harrington, esq. of Kelinton, near Bath. He was educated at Eton school, whence he removed to Cambridge. It appears, by a letter from Leley to James Harrington, that he married a natural daughter of Henry VIII., who was endowed with the lands of the priory of Bath. In 1791 he published a translation of Ariosto's Orlando Fur¬ioso, by which he obtained much reputation as a poet. He accompanied the earl of Essex to Ireland in 1599, and received from him the honour of knighthood; and in the reign of James I. he was made a knight of the Bath. He frequented the court, and cultivated the friendship of prince Henry, to whom he presented a manuscript discourse, entitled A Brief View of the State of the Church of England, to the Year 1602. This was a kind of continuation of Dr. Godwin's Catalogue of Bilbops; but its chief scope was to difcredit married prelates, especially those who had been twice married. The work contained many free cenfures upon particular bishops, on which account it was published in 1653, by the author's grandson, J. Chetwynd, esq. Sir John died in 1612. He had planned a history of his own times, but did not live to execute it. After his death were published his Epigrams, in four books. Two volumes of miscellaneous pieces, under the title of Nuge Antiques, were printed in 1769, and 1775; by Henry Harrington, of Queen's-college, Oxford.

HARRINGTON (James), a celebrated political writer, born at the family seat at Upton in Northamptonshire, in 1611. A fervious of temper, and great dis¬position to study, distinguished his early years, and accompanied him to Trinity-college, Oxford, of which he was admitted a fellow-commoner in 1629. After his tuition there, under the famous Chillingworth, he travelled abroad. In the Netherlands, he entered as a volunteer in lord Craven's regiment; and being quartered at the Hague, he frequented the courts of the prince of Orange and the queen of Bohemia, and ingratiated himself with those distinguished persons. He afterwards accompanied the elector-palatine in a visit to the king of Denmark, and remained as an attendant upon his person for some years. Refuming his plan of foreign travel, he visited Germany, France, and Italy, before he returned to England. The republican ideas with which he had imbued himself at the commencement of the civil contentions, to side with the parliament; but not being able to procure a seat in the house, he remained undistinguished till 1646. In that year, accompanying
panying the parliamentary commissioners to the king at Newcastle, he was placed by them about his person, as one whom they could trust, yet who had not rendered himself particularly obnoxious to him. On their recommendation, the king nominated him one of the growths of 1617, a post which he filled without disfaine, excited in him manifold signs of disapprobation. The royal confidence and familiarity, however, gained so much upon Harrington's mind, that he was heartily desirous of accommodating the differences between the king and parliament; and his solicitations to this effect were probably the cause that, when the treaty of the Isle of Wight was broken off, he was removed from his office. The king was much concerned at being deprived of his attendance; and is said to have given him a token of affection before his execution. That event gave a great shock to Harrington's feelings, and he never forbore to speak of it with extreme regret, and with commiseration of the unfortunate prince. Yet in his capacity of a writer he has done unfavourable part to Charles I. and imputed his fate to the divine judgment.

During the interregnum he passed his time in retirement, chiefly occupied in composing his famous work, *The Oceana.* The jealousy of Cromwell's government caused this performance to be seized at the press; but by the means of the author's application to Mrs. Claypole, Oliver's daughter, it was restored, and published in 1666. It soon became a subject of controversy, and the author made replies to various attacks upon it; in none of which he excelled suspicion so far, that in December, 1661, by order from Charles II. he was apprehended and committed to the Tower. It was a conflagration that the charge against him was not founded upon his writings, but upon a suppozed plot against the government, of which he knew himself innocent. He was, however, treated with great severity, and it was a long time before he recovered his liberty. He died of a paralytic stroke, in 1677, and was buried in St. Mary's-chapel, Westminster.

HARRINGTON, a thriving town of the American States, in Lincoln county, district of Maine, at the head of the tide-waters on the Kennebec river, three miles north of Hallowell, of which, till its incorporation in 1797, it was a part, and known by the name of Fort Western. Vessels of one hundred tons anchor the river to this town. The judicial courts for the county are held alternately here and at Pownalborough. Here is a courthouse and gaol. A bridge is erected on the Kennebec, opposite old Fort Western. Several merchants are settled here, and carry on a brisk commerce with the back country. The township contains 36,000 acres of land, and about one thousand inhabitants.

HARRIOTT, a town of Hindeoosa, in the country of Orilla; ninety-one miles north-north-east of Cat-tack, and 105 west-south-west of Calcutta.

HARRIOT (Thomas), an eminent English mathematician, born at Oxford, in 1560; in which university he received his education, and was entered at St. Mary's-hall college in 1617, upon the foundation of some

HARRIOT, in 1584, made a sufficient discovery of Virginia, which he first preceptor with the colony under Sir Richard Grenville in the following year. He was well qualified for the settlement of it. Mr. Harriot remained in that country about a year, diligently employed in surveying it, and in observing the nature of its productions, as well as the customs and manners of its inhabitants. On his return to England, he published A Brief Report of the Land of Virginia, of the Commodities there found, &c. 4to. which was written from Hakluyt's *Voyages,* and also translated into Latin, and published at Frankfort in 1590. Soon after this work had made its appearance, Sir Walter introduced Mr. Harriot to the acquaintance of Hugh Percy, earl of Northumberland, who granted him a yearly pension; Wood says of 190l, but from some receipts which Dr. Zach found among his papers, it appears that he had 300l. which at that time was a considerable income. And when, in 1666, that nobleman was committed to the Tower for life, a table was maintained for Mr. Harriot, and some others of his mathematical friends, with whom the earl paid his hours of confinement in literary and scientific speculations. Sir Walter, with his friend Charles I. imputed his fate to the divine judgment, and softened the rigours of his shameful imprisonment, by entering into literary and philosophical discussions with his former preceptor. Mr. Harriot, after the termination of this engagement, resided many years at St. John's-college, where he died of a disease in his lip, in 1621, in the fifty-first year of his age. And it is said that he was in religion a deist, and that eminent divines of those times considered the manner of his death to be a judgment upon him for undervaluing and rejecting the authority of the Scriptures. But this affection is not supported by any concurrent testimony, and is irreconcilable with the author's language in his writings, and the praise bestowed upon him by orthodox and distinguished characters. He was doublets of one of the first mathematicians of the age in which he lived, and will always be remembered as the inventor of the present improved method of algebraic calculation. This was published in 1615, in folio, by Mr. Warner, under the title of *Artis Analecta,* and was afterwards improved by the Adronomical Ephemeris of the Academy of Sciences of Berlin for the year 1788, from some valuable and curious manuscripts of Harriot's, which were discovered in 1784, at Petworth in Sussex, the seat of the earl of Egremont, a descendant from the generous earl of Northumberland who was Harriot's patron. But these manuscripts not only prove most satisfactorily that Harriot was entitled to the praise of invention as an analytical, but show that he was not less eminent as an astronmer and geometrical. Of the more remarkable are 199 observations of the sun's spots, with their drawings, calculations, and determinations of the sun's rotation about its axis. Hence there is the greatest probability that Harriot was the first discoverer of these spots, even before either Galileo or Scheiner; at least there are no earlier observations of the solar spots extant than his; as they run from December 8, 1610, till January 18, 1613. Had Harriot had any notion about Galileo's discoveries, he took the width of a degree of latitude as something about the phases of Venus and Mercury, and especially about the singular shape of Saturn, first discovered by Galileo; but there...
Harris, John Clarke, Esq. of Sandford, near Bridgewater, in the county of Somerset, by whom he had five children; two of these died at an early period: James, now Earl of Malmebury, and two daughters, have survived their father. In 1731, he published his Hermes, or a Philosophical Inquiry concerning Universal Grammar, which was received with great applause by the learned, and was dedicated to the ingenious Mr. Horne Tooke, in his Diversions of Purley, has made some severe criticisms upon it. The learned bishop Lowth, however, gave it a high character, by ascertaining that those who would enter deeply into the subject of universal grammar, will find it fully and accurately handled, with the greatest attention to investigation, perspicuity of explanation, and elegance of method, in a treatise entitled Hermes, by James Harris, Esq. the most beautiful example of analysis that has been exhibited since the days of Aristotle. We are informed by lord Malmbury, in the biographical sketch which that nobleman has given of his father's life, 'that what first led his father to a deep and accurate consideration of the principles of universal grammar, was a book which he held in high estimation, and was frequently quoted in his Hermes, 'the Minerva of Sanctius.' To that writer he confesses himself indebted for abundance of valuable information of which it appears (continues his lordship) that he knew well how to push his researches on the subject of grammar to a much greater length, by the help of his various and extensive erudition.'

Mr. Harris was no less a votary of the fine arts, than a lover of science. The superior taste and skill which he professed in music, and his extreme fondness for hearing it, led him to attend to its cultivation in his native place with uncommon pains and success; insomuch that, under his auspices, not only the annual musical festival in Salisbury flourished beyond most institutions of the kind, but even the ordinary subscription-concerts were carried on, by his affiduity and direction, with a spirit and effect seldom equalled out of the metropolis. Many of the beautiful selections made from the best Italian and German composers for these festivals, adapted by Mr. Harris to words which he himself selected from Scripture, or from Milton's Paradise Lost, and sometimes to compositions of his own, have survived the occasion on which they were first produced, and are still in great estimation. Two volumes of these selections have been lately published by Mr. Corfe, organist of Salisbury cathedral.

Mr. Harris was chosen a representative in parliament for the borough of Chirchhurch in Hampshire, in 1761, which feat he retained to the day of his death. In the following year, he was appointed to be a lord of the treasury: in 1774, he became secretary and comptroller to the queen, and this appointment he held during the remainder of his life. Although affiduous in the discharge of his parliamentary duty, and occasionally taking a share in the debates, he never contracted any violent spirit of party. He abhorred faction of every kind; nor did he ever relinquish, for public business, those still more interesting pursuits which had made the delight and occupation of his earlier years. If they were somewhat intermitted during the sitting of parliament, he renewed them with increased relish and satisfaction on his return into the country. But for this, we might feel surprize that he could have found time to compose and publish, in 1775, another learned work. It contains, under the title of Philosophical Arrangements, a part only of a larger work that he had meditated, but did not live to finish, on the Peripatetic logic. So far as it relates to the arrangement of ideas, it is copious, but it has other peculiarities which are not the less interesting, and give it a high estimation, and was frequently quoted in his Hermes, 'the Minerva of Sanctius.' To that writer he confesses himself indebted for abundance of valuable information of which it appears (continues his lordship) that he knew well how to push his researches on the subject of grammar to a much greater length, by the help of his various and extensive erudition.'

proceeded from the pen of this ingenious writer, was his Philosophical Enquiries; which was received by the learned world with merited praise. While we are reading this work, we see, as it were, listening to the conversation of an elegant scholar, a gentleman, a person of the greatest candour, sincerity, and worth; deficient in impressing his own liberal sentiments on the minds of others.

Of this last production of Mr. Harris's pen, Lord Malmbury observes: "It is a more popular work than any of his former ones, and contains rather a summary of the conclusions to which the philosophy of the ancients had conducted them in their critical inquiries, than a regular and perfect system. The principles which those conclusions depend are therefore omitted, as being of a more abstruse nature than was agreeable to his design; which was to teach by illustration and example, not by fictitious demonstration. Indeed, this publication appears to have been meant not only as a retrospective view of those studies which exercised his mind in the full vigour of his life, but likewise as a monument of his affection towards many of his intimate friends. I cannot therefore but consider it as a pleasing proof of a mind retaining, at an advanced age, a considerable degree of its former energy and activity, together with, the greatest candour, sincerity, and worth; desirous of the same equable and placid temper which had distinguished him throughout his whole life, the same tender and affectionate attention to his surrounding family, the same compassionate superintendence of the miseries which he had so long been made acquainted with, as well as being made to understand, and in his parliamentary capacity, to write critical remarks and conjectures on many of the passages extracted, but he was also in the habit of regularly committing to writing such reflections as arose out of his study, which evince a mind carefully disciplined, and anxiously bent on the attainment of self-knowledge, and self-government. And yet, though habituated to deep thinking and laborious reading, he was generally cheerful, even to playfulm. There was no pedantry in his manners or conversation, nor was he ever seen either to display his learning with ostentation, or to treat with flight or superciliousness those less informed than himself. He rather sought to make them partakers of what he knew, than to mortify them by a parade of his own superiority. Nor had he any of that miserable self-indulgent airs which so often disgraces men of learning, and prevents their being admired or esteemed, at least as much as they choose to appear to, by common performances, and therefore not all that their superiority deserves. "It was with him a maxim, that the most difficult, and infinitely the preferable, sort of criticism, both in literature and in the arts, was that which consists in finding out beauties, rather than defects; and although he certainly wanted not judgment to distinguish and to prefer superior excellence of any kind, he was too reasonable to expect it should very often occur, and too wise to allow himself to be disfigured at common weaknesses or imperfections. He thought, indeed, that the very attempt to please, however it might fall short of its aim, deserved some return of thanks, some degree of approbation; and that to endeavour at being pleasing by such means was due to gentleness of disposition, and a benign affection. Far, at the same time, from that presumptuous conceit, which is so natural to minds that cannot excel in the dispositions of Providence. He detested the gloom of superstition, and the persecuting spirit by which it is so often accompanied: but he abhorred still more that benevolent and destructive spirit [which has been termed] modern philosophy; and from his early solicitude to inspire me with a hatred of it, it would almost seem that he forebore its late alarming approach and fatal progress. There is no obligation which I acknowledge with more thankfulness; none that I shall more anxiously endeavor to confer upon my own children, from a thorough conviction of its value and importance.

My father's affection to every part of his family was exemplary and uniform. As to his public and private life, he was ever kind and indulgent; and it deserves to be mentioned to his honour, that he thought it no interruption of his gravest occupations, himself to instruct his daughters, by exercising them daily both in reading composition, and writing essays for their improvement, during many of their younger years. No man was a better judge of what belonged to female education, and the elegant accomplishments of the sex, or more disposed to set a high value upon them. But he had infinitely more at heart, that his children should be early habituated to the practice of religion and morality, and deeply impressed with their true principles. To promote this desirable end, he was assiduous both by instruction and example; being himself a constant attendant at public worship, and enforcing that great duty upon every part of his family. The deep sense of moral and religious obligations which was habitual to him, and those benevolent feelings which were so great a happiness to his family and friends, had the same powerful influence over his public as his private life. He had an ardent zeal for the prosperity of his country, and the real interests he well understood; and in his parliamentary conduct he proved himself a warm friend to the genuine principles of religious and civil liberty, as well as a firm supporter of every branch of our admirable constitution." Mr. Harris died on the 22d of December 1789, in the seventy-second year of his age. All his works...
works were collected by his only surviving son the earl of Mahonsebury, and published in two volumes quarto, in 1801, with an account of his father's life prefixed, as noticed above; and from which this article is drawn.

HARRISON (William), a protestant dissenting minister of eminent abilities and character, born at Salisbury about the year 1750; and afterwards resided at Honiton in Devonshire. On September 20, 1765, the degree of D.D. was conferred on him by the university of Glastonbury. He published an Historical and Critical Account of the Lives of James I. Charles I. and Oliver Cromwell, in 5 vols. 8vo. after the manner of Bayly. He also wrote the life of Hugh Peters; besides many fugitive pieces in support of liberty and virtue. All his works have been reviewed, and those that differ from him in principle, fill value him in point of industry and fruitfulness. This character is given in the words of his munificent patron Mr. Hollis, who had presented him with many valuable books relative to the subjects of his history. But the doctor's works are differently spoken of by others. They certainly have none of the vivacity which inspired Bayly; and in the judgment of diffuse and passionate readers, impartiality is sometimes violated. He died at Honiton, Feb. 4, 1770.

HARRIS, or Louisburgh, a town of the American States, in the state of North Carolina: forty-seven miles west of Halifax.

HARRISON (William), a writer much esteemed by the literati of his time, was fellow of New-college, Oxford, and tutor to one of the duke of Queenbury's sons. In this employment he attracted the favour of Dr. Swift, whose solicitations with Mr. St. John obtained for him the secretarialship to lord Raby, ambassador at the Hague, afterwards earl of Stratford. An interesting letter of his whilst at Utrecht, dated Dec. 16, 1724, is printed in dean Swift's works. Mr. Harrison, who did not long enjoy his rising fortune, was dispatched to London with the barrier-treaty; and died Feb. 14, 1712, Swift, in his Stella, laments his loss with the most unfealed於tence. Mr. Tickell has mentioned him with respect in his Prospect of Peace. Dr. Birch, who has given a curious note on Mr. Harrison's Letter to Swift, has confounded him with Thomas Harrion, M. A. of Queen's-college. In Nichols's Select Collection are some pleasing specimens of his poetry; which, with Woodstock-Park in Dodgley's Collection, and an Ode to the Duke of Marlborough, 1707, in Duncombe's Horace, are all the poetry he is known to have written. There was another William Harrison, author of The Pilgrim, or the happy Convert, a Pastoral Tragedy, 1709.

HARRISON (John), the accurate and celebrated inventor of the famous time-keeper for ascertaining the longitude at sea, and also of the compound, or, as it is commonly called, the gridiron pendulum; was born at Foulby, in the parish of Wragby, near Pontefract, in Yorkshire, in 1693. The vigour of his natural abilities, if not even strengthened by the want of education, which confined his attention to few objects, at least amply compensated the deficiencies of it; as fully appeared from the following projects he made in that branch of mechanics to which he devoted his time. His father was a carpenter, in which profession he obtained the means of supporting the family; and occasionally also, according to the miscellaneous practice of country artists, surveying land, and repairing clocks and watches. He was, from his early childhood, attached to any machinery moving by wheels; and while he lay sick of the small-pox about the fifth year of his age, nothing could pacify him but a watch placed open upon his pillow, which might amuse him by contemplating the movement. In 1700, he removed with his father to Barrow, in Lincolnshire; where, though his opportunities of acquiring knowledge were very few, he eagerly improved everything incident from which he might collect information; frequently employing all or great part of his nights in writing or drawing: and he always acknowledged his obligations to a clergyman who came every Sunday to officiate in the neighbourhood, who lent him a manuscript copy of professor Saunderston's Lectures; which he carefully and neatly transcribed, with all the diagrams. His native genius exerted itself superior to his solitary disadvantages; and in 1726, he had constructed two clocks, in which he applied the escapement and compound pendulum of his own invention; these surpassed everything then made, scarcely erring a second of time in a month.

In 1728, he came up to London with the drawings of a machine for determining the longitude at sea, in expectation of being enabled to execute one by order of the board of longitude. Thence he wrote to Dr. Halley, who, discovering he had uncommon merit, advised him to make his machine before he applied to the board of longitude. He returned home to perform this task; and in 1735 came to London again with his first machine; with which he was sent to Lisbon the next year for a trial of its properties. In this short voyage, he corrected the dead reckoning about a degree and a half; a success that proved the means of his receiving both public and private encouragement. About the year 1739, he completed his second machine, of a construction much more simple than the former, and which answered much better to his expectations than the other; but in an endeavour to improve pocket-watches, he found the principles he applied to far surpass his expectations from much, as to encourage him to make his fourth time-keeper, which is in the form of a pocket-watch, about six inches diameter. With this time-keeper his son made two voyages, the one to Jamaica, and the other to Barbadoes; in both which experiments it corrected the longitude within the nearest limits required by the act of the 12th of queen Anne; and the inventor therefore, at different times, though not without infinite trouble, received the proposed reward of twenty thousand pounds. These four machines were given up to the board of longitude. The three former were not of any use, as all the advantages gained by making them were comprehended in the last; they were worthy, however, of being called such, as mechanical curiosities, in which might be traced the gradations of ingenuity executed with the most delicate workmanship: for which purpose they were deposited in the royal observatory at Greenwich. The fourth machine, emphatically distinguished by the name of The
time-keeper, has been copied by Mr. Kendal; and that a ten-weeks trial, in 1772, at the king's private observatory at Richmond, erred only 4½ seconds. Within a few years of his death, his constitution visibly declined; and he had frequent fits of the gout, a disorder that never attacked him before his 77th year: he died at his house in Red-lion-square, in 1776, aged 83. The re- cluse manner of his life in the unpretending publick object, was by no means calculated to qualify him as a man of the world; and the many discouragements he encountered in soliciting the legal rewards of his labours, full left disposed him to accommodate himself to the humours of mankind. In conversing on his profession, he was clear, distinct, and modest; yet, like many other mere mechanics, he found a difficulty in expelling his meaning by writing; in which he adhered to a peculiar and uncouth phrasmology. This was but too evident in his "Description concerning such mechanisms as will afford a nice and true mensuration of time, &c." 8vo. 1775; which his well-known mechanical talents will induce the public to accept for from his acquaintance with letters, from his advanced age, and situation in the publick services, among which may be reckoned his obstinate refusal to accept of any alms whatever in this publication. This small work includes also an account of his new musical scale; or mechanical division of the octave, according to the proportion which the radius and diameter of a circle have respectively to the circumference. He had in his hands the catalogue of the distinguished band of church-fingers; had a very correct ear for music; and his experiments on found, with a most curious monochord of his own invention, are reported to have been not less accurate than those he was engaged in for the mensuration of time.

HARRISON, a township of the American States, in Weft Chester county, New York, containing 1003 inhabitants; of whom 215 are electors.

HARRISON, a county of the American States, in the western part of Virginia, bounded north by Ohio county, north-east by Monongalia, south by Greenbrier, and south-west by Kenhawa. Its length is about 120 miles, its breadth eighty; and the number of inhabitants 2850. Chief town, Charleston.

HARRISON, a county of the American States, in the north-eastern part of the state of Kentucky, north of Bourbon.

HARRDSBURG, or Harrodstown, a poft-town of the American States, in Mercer county, Kentucky, at the head of Salt-river: ten miles south-west of Danville, thirty south-west of Frankfort, 855 south-west of Philadelphia, and twenty-four south-west of Lexington. Lat. 37. 50. N. Lon. 85. 22. W. Greenwich.

HARRISGATE, a village in the West Riding of Yorkshire, in the vicinity of Knareborough, remarkable for its medicinal springs. There are three in number, all different in their qualities, notwithstanding their continuity. 1. The Tewet Well, or Sweat Spa, a spring of a milky taste, found in gravelly valleys, discovered by Mr. Slingsby in 1655. 2. The Sulphur Spring, useful in dropsical, scrobutious, and gouty, cafes; fires in the town, and is received in four basins under four different buildings; at one it is drunk, and hence called the Drinking Well; at the others it is used for hot or cold baths. It is distillat and attenuating, and a warm bath of it is of great service in dropsical and gravelly cases; for dissolving hard swellings, curing old ulcers and scrofulous complaints, and is a powerful cleanser of the stomach and bowels. 3. St. Mongah's Well, or Old Spa, so called from Kentigern a Scotch saint, whom his tutor Ser- vanus bishop of Orkney, out of affection for him, called Mongab, which in the Norway language signifies dear friend. The Harrogate feaon lafts from May to Michaelmas.

HARROW, f. [harwye, Fr. harcze, Germ. a rake.] A frame of timber, crossed each other, and set with teeth, drawn over fowed ground to break the clods, and throw the earth over the feed.—See the article Harrow.

The land with daily care is exercis'd, and with an iron war
Of rakes and harrows.

Dyden.

To HARROW, v.t. To cover with earth by the harrow:
Friend, harrow in time, by some manner of means,
Not only thy pleaun, but alfo thy beans. Taffier.
To break with the harrow.—Can't thou bind the un¬
icorn with his band in the furrow? or will he harrow the
valleys after thee? Job xxxix. 10.

Let the Wolcans
Plow Rome and harrow Italy.

Shakespeare.

To tear up; to rip up:
I could a tale unfold, whose lighted word
Wound harrow up thy foul, froze thy young blood,
Make thy two eyes, like flars, flirt from their spheres,
In time, by fome manner of means.

HARROW, interj. An exclamation of sudden dif.

trefs. Now out of ye.

Harrow now out and weal away, he cried;
What difmal day hath fent this curfed light,
To fee my lord fo deadly damnify'd.

Shakespeare.

HARROW-ON-THE-HILL', a town of Middlesex, fo called from its situation on the highest hill in that county; ten miles north-west of London. It is noted for a free school, founded in the reign of queen Elizabeth. A silver arrow is shot for here once a year, viz. August 4, by a felected number of the scholars, who are attired for the purpose in the habit of archers.

HARROWING, f. The act of raking ploughed
land with a harrow.

HARROWTINE, f. The iron tooth of a harrow.
To HARRY, v.t. [harrer, Fr.] To teaze; to harre;
to ruffle.—I repent me much that I fo harry'd him. Shakespeare.—In Scotland it signifies to rob, plunder, or opprel: as, to harree a nefh; thaf is, he took the young away: as alfo, he harried me out of my house and home; that is, he robbed me of my goods and turned me out of doors. See Te HARR.

HARRY ISLAND, an ifland of the Atlantic, near the mouth of the Santee River, on the coast of South Carolina.

HARRYING,

Denham.

HAR'SHA, [Hebrew.] A man's name.
HARSH'LY, adv. Sourly; aulterely to the palate,
adv.
HARSH'NESS, n. Sourness; aultere taste.—The unequal
distribution of the spirits maketh harshness. Bacon.
harshness of the ear.—Neither can the natural harsh-
ness of the French, or the perpetual ill harmony, be ever
reined into perfect harmony like the Italian. Dryden.
Tis not enough no harshness gives offence;
The found must seem an echo to the fene. Pope.
Ruggedness to the touch.—Harshness and ruggedness of
bodies is unpleasant to the touch. Bacon.—Crabbedness;
harshness; peevilness;
Thy tender-hefted nature shall not give
Thee o'er to harshness; her eyes are fierce, but thine
Do comfort, and not burn. Shakespeare.

HARS'KIRCH, a town of Germany, in the circle of Upper Saxony, and
county of Naffau Saarbruck: six miles east-fourth-east of Zwicke.
HARTENSTAIN, a town of Germany, in the arch-
duchy of Austria: twelve miles west of Crea.
Hartenstein, a town of Germany, in the circle of Upper Saxony, and
lordship of Schonburg: six miles south-east of Zwicke, and eighteen east of Greitz.
HARTFORD. See Tordylium.
HARTFORD, a township of the American States, in Windfor county, Vermont, on Connecticut river, op-
opposite Lebanon, in New Hampshire, containing 988 in-
habitants.
HARTFORD, a town, of the American States, on the east bank of Genesee river, in New York State, for-
more west of Genera, and sixty-seven south-east-
yeast-by-east of Fort Niagara.
HARTFORD, a fertile and populous county of the American States, in Connecticut, bounded north by the State of Maffachusettss; fourth by that of Middlefex and Newhaven counties; east by Tolland; and west by Litch-
field county. It is about thirty-four miles from north to south, and its greatest breadth from east to west is thirty miles. It is divided into fifteen townships, and
contains 28,029 inhabitants. Chief place, Hartford city.
HARTFORD, a city of the American States, and
capital of Connecticut, lies on the west bank of Connect-
ict river, in the county and township of its own name,
fifty miles north-westerly from the mouth of the river, at Saybrook Bar, in Long Island Sound; and thus far the tide flows. The township is six miles square, bounded north by Windfor, north-east by East Windfor, west by Farmington, east by East Hartford, south-east by Glas-
tonbury, and south by Wethersfield. The town is di-
vided by a small stream called Little River, with high
stone banks, over which is a bridge connecting the
two divisions of the town. The city is regularly laid out, the streets interfecing each other at right angles. Its
buildings are an elegant State-house, two churches for congregationalists, one for episcopalian, and between 400 and 500 dwelling-houses; a number of which are handomely built with brick. The inhabitants amount to upwards of 4000. A bank was incorporated in 1792, with 100,000 dollars capital, number of shares 450.
The corporation have the power to extend their capital to
500,000 dollars. A woollen manufactury was established
here, and encouraged by the state, but has not succeeded.
The town is advantageously situated for trade, has a fine
back-country, enters largely into the manufacturing busi-
dness, and is a rich, flourishing, commercial, town. It
was first settled in 1636, by Mr. Haynes and Mr. Hooker,
who, with their adherents, removed from Maffachusettss. The Dutch had then a trading-houfe at the confluence
of Mill and Connecticut rivers. They soon relinquished
the settlement, and their lands were confiscated by a com-
mission from the Commonwealth of England in 1653. A
point of land, which formed part of their possessions, is
still called Dutch Point. It is forty miles north-east-by-
North of Newhaven, fifty-five north-west of New London, the
44th west of Boston, 128 north-east of New York,
223
from Washington city, 1044 from Augusta, and 1018 from Frankfort in Kentucky. Lat. 41. 44. N. Ion., 70. 4. W. per Saxony, and circle of Leipfic : five miles south-west of Dobeln, and seven north-east of Rochlitz.

in Windfor county, Vermont, situated on the west bank of Connecticut river, eleven miles below the Fifteen-

county.

in the county of Durham, on the German ocean, lying

miles from Sunderland, thirty-two from Newcastle ;
in the county of Durham, on the German ocean, lying

miles from London. It stands on the promontory called Hartland-Point, which is the extreme north-west part of the county, and runs out a good way into the sea; and had formerly a monastery. In the reign of queen Elizabeth a bill was preferred in parliament for making a port here. The market is on Saturdays, and is often frequented by people from Cornwall; and as

the fishing-boats of Barnstaple, Biddiford, and the other

towns on the coast, lie often under these rocks for shelter from the south-west or south-east winds; the seamen make this their place of rendezvous, and supply themselves with provisions; nor is the town itself deftitute of a considerable share in the herring-fishery on this coast. The fair are on Easter Monday and the Wednesday after Easter, viz. that which was the former passage for ships on the west; two arched carriage-ways through the walls, one on the south, and the other on the north-west; the other a small gate for foot-passengers, near a ferry on the west. Here is a handsome guildhall in the middle of the town, where the mayor is chosen, and the other public

bureaus of the town transacted. On the Town Moor are two batteries, with some fine ordnance; the remains of a friary; and the break-water of an entrepôt. The fishing bureaus is the only trade now carried on here, in which the people are very skilful and expert. Great quantities of fish are taken here, and mostly sent inland: as, hollibut, turbot, sole, skate, and several other sorts of flat-fish; also, cod, ling, sole, haddock, mackerel, herrings, whittings, lampreys, lobsters, crabs, shrimps, oysters, &c. The present harbour lies on the south of the town; the entrance is easy, safe, and good, for vessels of a small draft, which find a safe retreat here when stopped short of Newcastle, Shields, and Sunderland. It is prefixed, that here is an opportunity of having one of the dry harbours on the east-coast.

Hartlepool is much frequented by genteel people, for sea-bathing, during the summer months, and has been considerably increasing in buildings and accommodations. During the summer months it is a pleasant place, and has severla agreeable and delightful walks and rides. The prospects are sublime: the indescribable crenelle of the German ocean on the east; a grand chain of Yorkshire high lands at a few miles distance on the south; the bay between; the great extent of diversi-}

Here is a handsome guildhall in the middle of the town, where the mayor is chosen, and the other public
elected one of its fellows. Being originally intended
for the church, his thoughts and studies were for some
time directed towards that object: but upon a closer
tenor toward the terms of clerical conformity, serious
fructes arose in his mind against subscription to the
thirty-nine articles of religion. Finding, therefore, that
he could not enter into the service of the national efta-
tife phylfic at Newarck, in Nottinghamshire; whence he
migrated by the concurrence and intimacy of fome of
his proper and learned men of his age. From his
early youth he was devoted to the fciences; particu-
larly to logic and metaphysics. He ftudied mathema-
tics, together with natural and experimental philofo-
phy, under the celebrated professor Saunders fon. After
this Hartley removed to Edinburgh, where he obtained
upon phyfological fubjects, he prefented to the
world, in 1749, his valuable work, entitled, Observa-
tions on Man, his Frame, his Duty, and his Expectations,
in two Parts, 2 vols. 8vo. The most valuable edition of
it was published in 1791, in 4to. with notes and addi-
tions to the second part, translated from the German of
the Rev. Hermann Andrew Pidriorius; with a sketch of
the life and character of the author, by his son. Dr.
Hartley lived about nine years after the publication of
this work, and died at Bath in 1757, at the age of fifty-
two years. He is faid to have written in defence of in-
oculation for the small-pox, againft the objections of
Dr. Warren, of Bury St. Edmund's; and fome papers
of his are to be met with in the Philosophical Trans-
actions. He was principally inftitutional in procuring for
the empiric, Mrs. Stephens, the five thoufand pounds
grantd by parliament, for discovering the composition of
her medicine for the fome. In 1738 he publifhed,
Observations made on ten Perfons who have taken the
Medicament of Mrs. Stephens, 8vo. which were follo-
ved in 1739, with his View of the prefent Evidence
for and againft Mrs. Stephens's Medicine as a Solvent
for and againft Mrs. Stephens's Medicine as a Solvent
for the Stone, containing one Hundred and fifty-five
Cases, with fome Experiments and Observations, 8vo.
and a Supplement to the View of the prefent Evidence,
8vo. A vol. of 170 pages, in folio. The State of the
Elefior of England, at Berlin. In 1704, after three years folicitation by the
prince elector palatine, Mr. Hartfoeker repaired to the court of
that prince, by whom he was appointed honorary profofior of phyfology in the university of Heidelberg.
In the years 1707 and 1708, he publifhed, in 2 vols. 4to.
the lectures he had given in that university, under
the title of Physical Conjectures. After the publication of
these works, he set out on a visit to the learned in
other parts of Germany, and at Hesl-Caffel was tempted
by liberal offers to enter into the service of the land-
guard, but without effect. At Hanover he met with a
gracious reception from the elector, afterwards George I.
of England. Upon his return to the court of the
elector palatine, that prince having had the burning
ghls conftructed by M. Tschirnhausen, applied to Hart-
foeker to make one of the fame kind; upon which he
carved three to be cafe in the glafs-houfe at Neuberg,
and having fon finifhed them, he prefented the elector
with the largelft of them, which was three feet and five
inches (Rhineland meafure) in diameter, with a focus of
nine feet. In 1710 he publifhed a volume entitled,
“Eclaircijfancs fur les Conjectures Phyfiques,
containing anfwers to objections to his Physical Conjectures,
" which
which he attributes to M. Leibnitz; and two years afterward another volume, by way of sequel to it, which in 1722 was followed by a collection of several separate pieces, the name and title of which was After the death of the elector palatine in 1716, he quitted the palatine court, and was again invited into the service of the landgrave of Hesse; but he preferred a more independent life, and removed to Utrecht, where he undertook a course of natural philosophy. He died in that city in 1745, when about sixty-nine years of age. After his death, in 1730, his Course of Natural Philosophy was published at the Hague, in quarto, accompanied with several separate treatises in physics, and a critical extract of the most curious and useful observations from the Letters of Linnæus.

HARTZEIN (Joseph), a learned Jesuit, born at Cologne, in 1664. After having taught the belles-lettres in the seminaries of his order, he went to Milan, to study theology, and filled the chair of professor of the Greek and Hebrew languages in that university. From Milan he went to Rome, and the other principal cities of Italy, where he contracted an intimacy with the men most eminent for their talents and learning. Father Schanze, a

HARVEST-TIMES, /. The season of harvest.

HARVEST-WORK, /. The labour of gathering in the fruits of the harvest.

HARVESTER, /. One who works at the harvest.

HARVEY (William), an eminent physician, who first discovered the circulation of the blood, born at Folkstone in Kent, April 5, 1628. At ten years of age he was sent to a grammar-school at Canterbury, and at fourteen removed thence to Caius-college, in Cambridge. At nineteen he travelled through France and Germany, to Padua in Italy; where, having studied physic under Eustachius Radius, John Minardus, and Hieron. Fabricius, he was admitted to the degree of doctor of physic and surgery in that university, in 1628. He had a particular regard for his last master; and when he was built of a motley kind of marble; it has a mine-office alone untouched. Soon after returning to England, he was incorporated doctor of medicine at Cambridge. From thence he went to London to practise, and married the daughter of Lancelot Browne, M. D. but by whom he had no issue. In 1644, he was admitted candidate of the college of physicians in London; and three years after made a fellow. In 1653, he was appointed lecturer of anatomy and surgery in that college, and the year after began a course of lectures, in which he first opened his discovery relating to the circulation of the blood. The original manuscripts of these lectures is extant in the valuable museum of the late Sir Hans Sloane, which was purchased by parliament, and is intitled, "Prædictios Anatomie, Notexed, per Dr. plateaus Harriæanum, medicum Londom, anat. & chirurg. professo." In 1668, he published this most valuable discovery, under the title of "Exercitatio Anatomica de motu cordis et sanguinis," and dedicated it to Charles I. There follows also another dedication to the college of physicians, in which he observes, that he had frequently before, in his anatomical lectures, declared his opinion concerning the motion and use of the heart, and the circulation of the blood; and for above nine years had confirmed and illustrated.
In 1635, Dr. Harvey was made physician to Charles I. as he had been before to king James; and adhering to the royal cause upon the breaking out of the civil wars, attended his majesty at the battle of Edgehill; and went thence to Oxford; where, in 1635, he was Incorporated doctor of physic in that university, as he had before been at Cambridge and Padua. In 1645, the king got him elected warden of Merton-college; but, upon the surrender of Oxford the year after the parliament, he left that office and retired to London. In 1651, he published his book, intituled, *Exercitationes de generatione animalium; quibus accuratum quadrupedum de membranis ac humoribus ueteri, & de conceptione.* This is a curious and valuable work both of physiology and anatomy; and would have been more so, but for the misfortune by which his papers perished during the time of the civil war. For, although he had both leave and an express order from the parliament to attend his majesty upon his leaving Whitehall, yet his house in London was, during his absence, plundered of all the furniture; and his *Deferfaria,* with a great number of anatomical observations, relating especially to the generation of insects, were taken away by the savage hands of the rude invaders. In 1654, he was elected president of the college of physicians in his absence: and, coming thither the day after, he acknowledged his great obligation to the parliament for placing him into a place of the utmost honour and dignity, as if he had been elected to be *Medicorum omnia apud Anglos praecepis.* But his age and weakness were so great, that he could not discharge the duty incumbent upon that great office; and, therefore, he prevailed with Dr. Prynne, who had deserved so well of the college. As he had no children, he named as his successor, and Vander Leeuven, his confidérante, Dr. Harvey and England should run away with all the glory. Some affirmed, that father Paul was the first discoverer of the circulation; but, being too much suspected for heterodoxies already, durst not make it public, for fear of the inquisition. Honorus Faber professed himself to be the author of that opinion; and Vander Leeuven, his confidérante, published an edition of Hippocrates, about the middle of the seventeenth century, took a great deal of pains to prove, that this father of physic knew the circulation of the blood, and that Harvey only revived it; but the honour of the discovery has been sufficiently ascribed and confirmed to Harvey. The true claimant of the cause appears to be, according to Haller, that the lefser circulation, through the lungs, was previously known to several; that of the greater, there are slight notices in the works of Cæsàlinus; but no one before Harvey had demonstrated the truth by convincing experiments and reasonings, and hence the general opinion on this part of the question remains unaltered, owing to the just and fortunate investigation of Harvey. Though he himself attributed his first glimpse of the truth to the view of the valves of the veins as exhibited by his great master Fabricius, yet that celebrated anatomist had not drawn any such inference from his own discoveries.

Harvey made the college his heirs, and settled his paternal estate upon them in July following. He had three years service so well of the college. As he had no children, it was conferred upon him as an illustrious example of that virtue; but his justice, like that of most despots, was an object of general admiration. The London college of physicians honoured his memory by publishing a splendid edition of all his works in quarto, 1674, to which a Latin life prefixed was prefixed, elegantly written by Dr. Laurence. 

**Harvey's Island**, an island in the Southern Pacific Ocean, composed of three or four small islands, united together by rocks covered by the sea, the whole about twenty miles in circumference, discovered by Captain Cook in 1773. *Lat. 19. 18. S. lon. 155. 48. W. Greenwich.*

**Harumaph,** [Hebrew.] A man's name.

**Harum Scaramus, adj. Precipitate; wild; giddy. A vulgar word.**

**Harum,** [Hebrew.] A man's name.

**Harun, or Haroun Al Rashid, kaliph of Bagdad, was the second son of the kaliph Mahadi or Mohdi. In early youth he acquired military renown in the command of an expedition sent by his father against the Greek empress Irene, in which he laid waste several of the Asiatic provinces of the empire, and his train filled Constantinople itself, and compelled the empress to purchase peace by a tribute. After the short reign of his elder brother Hadi, he succeeded to the kaliphate A. D. 756, being then about twenty-four years of age. He was the most potent and vigorous monarch of his race, and ruled over territories extending from Egypt to Khurasan. The name of Al Rashid, the Righteous, or True, was conferred upon him as an illustrious example of that virtue; but his justice, like that of most despots, was fulfilled by occasional acts of violence and cuprice. For his history and exploits see the article Bagdad, vol. ii. p. 643.*

**Haruphite,** [Hebrew.] One of a people. 1 Chron. xii. 5.

**Harus'Pex, a footsayer at Rome, who drew omens by consulting the entrails of beasts that were sacrificed. He received the name of Arufpes, ab artis ascificiendis; and that of Extipes, ab extis ascificiendis. The order of Arufpices was first established at Rome by Romulus, and the first Arufpices were Tusculum, a most inviolable and dignified person, who was particularly famous in that branch of divination. They had received all their knowledge from a boy named Tages, who, as was commonly reported, sprung from a cloud of earth. They were originally three, but the Roman senate yearly lent five noble youths, or, according to others, two, to Herculaneum, to be instructed in the mysteries of the art. The office of the Arufpices confided in observing these four particulars; the beast
before it was sacrificed; its entrails; the flames which consumed the sacrifice; and the flour, frankincense, &c., which was used. If the beast was led up to the altar with difficulty, if it escaped from the conductor's hands, roared when it received the blow, or died in agonies, the omen was unfortunate. But, on the contrary, if it followed without compulsion, received the blow without difficulty, and died without groaning, and after much effusion of blood, the frankincense fell at its feet, and the victim was fortunate. When the body of the victim was opened, each part was scrupulously examined; if anything was wanting, if it had a double liver, or a lean heart, the omen was unfortunate. If the entrails fell from the hands of the sacrificer, and seemed besmeared with too much blood, or were not preserved, as forming the augury, it happened during the two victims which J. Caesar offered a little before his death, the omen was equally unlucky. When the flame was quickly kindled, and when it violently consumed the sacrifice, and arose pure and bright, and like a pyramid, without any paleness, smoke, sparkling, or crackling, the omen was favourable. But the contrary augury was drawn, when the fire was kindled with difficulty, and was extinguished before the sacrifice was to begin, or when it rolled in circles round the victim with intermediate spaces between the flames. In regard to the frankincense, meal, water, and wine, if there was any deficiency in the quantity, if the colour was altered, or the quality was changed, or if anything was done with irregularity, it was deemed injurious.

This custom of consulting the entrails of victims did not originate in Tuscany, but was in use among the Chaldaeans, Greeks, Egyptians, &c. and the more enlightened part of mankind well knew how to render it subservient to their wishes or tyranny. Agæus, when in Egypt, raised the drooping spirit of his soldiers by a superstitious artifice. He secretly wrote in his hand the word magi, valiant, in large characters, and holding the entrails of a victim in his hand till the impression was communicated to the felth, he showed it to his soldiers, and animated them by observing, that the gods signified their approaching victories even by marking it in the body of the sacrificed animals. Ce. de Div.

HARUS/PICES, the sect or order of soothsayers, who followed the mode of augury or divination effalibled by Haruspex, as described above.

HARUZ, a man's name.

HARWICH, a considerable sea-port town in the county of Essex, distant twenty-five miles from London; the station of the packet-boats for Holland, with a safe and convenient harbour, which is so spacious, that in the Dutch war, one hundred flag of war men were anchored there at one time, with their tenders, besides three or four hundred flag of coill for; it is entirely harbour to within two miles of Ipswich, and able to receive ships of 100 guns all the way. June 3, 1665, the great battle was fought off this place, whereon eighteen capital Dutch ships were taken, and fourteen destroyed. Though the entrance into the sea is between two and three miles wide at high-water, yet the channel where ships must keep to enter the harbour, which is on the Suffolk side, is deep and narrow; so that all ships that come in or go out are commanded by the guns at Languard-fort on that side. Languard-fort seems to belong to Suffolk, but is in the limits of Essex, and has a magnificent prospect of the coasts of both counties. It was erected in 1188, and is maintained for the defence of the port of Harwich. It is placed on a point of land so surrounded with the sea at high-water, that it looks like an island. A large headland is on the one mile side.

The making its foundation solid enough for so good a fortification cost many years labour, and a prodigious expense. It was repaired in the reign of James I. when it was much more considerable fortification than at present, having four bastions mounted with sixty very large guns; particularly those on the royal bastion, which would throw a twenty-eight-pound ball over Harwich. Here is a small garison, with a governor, and a platform of guns. The fort has lately been refitted and greatly enlarged for the convenience of the officers of the ordnance, engineers, and maro; and a barric is built for the soldiers. Harwich was fortified heretofore on the land-side, but in the reign of Charles I. the fortifications were demolished. Here is a very good dock for building ships, with the necessary stores-houses, launches, &c. The church here, ever since the reformation, has been a chapel to the mother-church at Dover-court. The town of Harwich is well-built and populous, has a good maritime trade, and is almost encompassed by the sea, and has strong works. It is walled in and defended with strong palisades, and burning down from the cliff, where there is a pietifying water between the town and Beacon-hill, soon grows as hard as stone; and the inhabitants boast that the wall is as strong, and the ftreets as clean, as those formed of real stone.

Harwich has been long reforted to as a bathing-place. Here are two hot and two cold salt-water baths, of elegant structure and curious contrivance. The buildings stand in a large reservoir, containing many hundred tons of pure sea-water, renewed by every tide from the sea; and from this reservoir the baths are continually supplied with pure running sea-water, at every hour of the day, by a contrivance that exactly resembles a natural spring. Harwich also receives the sea-water surrounding the whole body, or any particular limb or limbs, in the form of hot sea-water. This place was first made a free borough, and had a grant of its market (held on Tuesdays) in the reign of Edward II. Its government was settled by charter of James I. in a mayor, chosen yearly, out of eight aldermen, who, with twenty-four capital burgesses, the electors, and the recorder, form the corporation. By this charter it had also a power to elect two burgesses to parliament, the grant of its Friday market, and its two fairs, on May-day and October 18, which are each for three days. This town, which derives its name from the Saxson word harpe, a haven or bay, has no great claim to antiquity. It, however, sent members as early as 17 Edward III. when it discontinued, until it was restored by James I. The right of election is in the mayor, aldermen, and capital burgesses, or headboroughs, resident within the same. In the penion-list of Charles II. it appeared, that Thomas King, member for Harwich, had a pension of 50s. a-fection, besides fees and drink, and was a member for Harwich, with the Stour from Manningtree, forms the harbour of Harwich, called Orwell-haven. These waters render the situation extremely convenient for small craft; and in consequence upwards of sixty fishing-vessels are kept here, and employed in the North-Sea fishery, which forms a very considerable part of the trade of the place.

HARWICH, a township of the American States, on Cape Cod, in Barnstable county, Massachusetts, lying between Yarmouth and Chatham, eighty-eight miles south-east from Boston, containing 2,552 inhabitants. It extends quite across the Cape, which is about fix miles over. Their marine business lies chiefly in the harbour.

The remains of the Indians of this township are reduced to only five or seven families, who live at Potanumauk. Harwich has been long reforted to as a bathing-place. Here are two hot and two cold salt-water baths, of elegant structure and curious contrivance. The buildings stand in a large reservoir, containing many hundred tons of pure sea-water, renewed by every tide from the sea; and from this reservoir the baths are continually supplied with pure running sea-water, at every hour of the day, by a contrivance that exactly resembles a natural spring. Harwich also receives the sea-water surrounding the whole body, or any particular limb or limbs, in the form of hot sea-water. This place was first made a free borough, and had a grant of its market (held on Tuesdays) in the reign of Edward II. Its government was settled by charter of James I. in a mayor, chosen yearly, out of eight aldermen, who, with twenty-four capital burgesses, the electors, and the recorder, form the corporation. By this charter it had also a power to elect two burgesses to parliament, the grant of its Friday market, and its two fairs, on May-day and October 18, which are each for three days. This town, which derives its name from the Saxson word harpe, a haven or bay, has no great claim to antiquity. It, however, sent members as early as 17 Edward III. when it discontinued, until it was restored by James I. In the penion-list of Charles II. it appeared, that Thomas King, member for Harwich, had a pension of 50s. a-sea, besides fees and drink, and was a member for Harwich, with the Stour from Manningtree, forms the harbour of Harwich, called Orwell-haven. These waters render the situation extremely convenient for small craft; and in consequence upwards of sixty fishing-vessels are kept here, and employed in the North-Sea fishery, which forms a very considerable part of the trade of the place.

HARWICH, a township of the American States, in Rutland county, Vermont, containing 165 inhabitants.

HARWICK, a township of the American States, in Rutland county, Vermont, containing 165 inhabitants.

HARWICK, a township of the American States, in Rutland county, Vermont, containing 165 inhabitants.

HARWOOD, a small town in the North Riding of Yorkshire, seven miles from Leeds, with a stone bridge of four arches over the Wharfe, which runs in a bed of stone as clear as crystal. Near it are the ruins of an ancient castle, built soon after the conquest, and which remained...
remained a strong building in Camden's time. It had a variety of mafers; one of whom, in the reign of king John, obtained a grant for a market and fair here. The remains of the castle, which seems to have been the last it covered near an acre of ground. In the church are some ancient monuments, particularly that of lord chief-justice Gascoigne, who committed the prince of Wales to prison for firing him on the bench.

HARWOOD (Edward), an English protestant dif-
fusing minister, born in Lancashire in 1729. He was in-
structed in grammar learning at Blackburn; and when
properly qualified to enter on academic studies, he was
placed in one of the institutions for educating difsenti-
enting ministers, which are supported by Mr. Coward's
funds. In 1765, he accepted of an invitation to become pa¬
ofer of a congregation at Bristol, with whom he con-
tinued about five years. Upon quitting Bristol he came
there, where he made an unsuccessful application
for a place then vacant in the British Museum; yet by
private tuition, together with other literary engage-
ments, he was enabled to procure a sufficient main-
tenance for himself and family. He died in 1794, when
about sixty-five years of age, after having suffered
by a paralytic attack, which deprived him of the
use of his left side. Dr. Harwood was the author of,
nalian Doctrine, the Socinian Scheme, the Perfon of
Christ, &c. 1772, 8vo. 4. The Life and Character of
Jefus Chrift delineated, 1773, 8vo. 5. A View of the
various Editions of the Greek and Roman Classics, 1775,
8vo. 6. An edition of The New Teftament in Greek,
with Notes in English, 1776, in 2 vols. 8vo. 7. Ser-
mons, 1776, 8vo. 8. The melancholy Doctrine of Pre-
defifion expofed, and the delightful Truth of Univer-
sal Redemption represented, 17,78, 8vo. 9. The great
Duty and Delight of Contentment, 1783, 8vo. &c. Of
all his performances, that which contributes most to the
author's reputation as a scholar, is his View of the va-
rious Editions of the Greek and Roman Classics, which,
though an imperfect, is a valuable work, and has not
only undergone repeated improvements in this country, but
has also been translated into many foreign languages.

HARZ, a forest and mountains in Germany, in the
circle of Lower Saxony, extending from the bailiwic
of Landgeltheim, in the principality of Wolfenbuttel,
and the county of Gofsloar, through the east part of the
principality of Grubenhagen, to the county of Gofslar, through the east part of the prin-
cipality of Kaukeban; westward it meets the fove-
prife of the confederacy of chiefs, is the name by
which in the towns the owner of every
house is taxed in one rix-dollar, and a lodger and a mine-
ducer of miners, labourers in the fmelting-houfes, wood-
howers, carriers, and the fovereign's officers and fer-
vants; together with minifters, schoolmafters, artificers,
handicraftmén, and tradefmen. They neither pay lenc
nor contribution money; the only imposts levied on them
being that whereby in the towns the owner of every
house is taxed in one rix-dollar, and a lodger and a mine-
oficers in half a one, with a small excife on beer imported
here. But this is again applied to the mineage, and
benefit of the miners and labourers in the fmelting-
oufes.

HAS, a town of Arabia Felix, in the province of
Yemen, capital of a diithric, and residence of a dola:
25. E. Greenwich.

HASAB, a town of Afa, in the province of Canda-
har, near the river Belific: thirty leagues north-well
of Cudahar.

HADDI'ALLI, [Hebrew.] A man's name.

HASAKLU, a town of Afaic Turkey, in the pro-
vince of Notalia; five miles north-west of Beifheri.

HASAN-BASSA-PALAN'KA, a town of Servia:
twenty miles south of Senicndria.

HASAU, a town of the duchy of Coulund, six miles
west of Piltyn.

HAS'AIN, or HAS'BEIN, an ancient country of
Germany, in the circle of Weffphalia, united in the year
1030 to the bishopric of Liege. Vifet and St. Tron are the
principal towns.

HAS'BERG, or HAAS'BERG, a citadel of Germany,
in the duchy of Carniola: three miles north-north-west
of Circnitz.

HASBERGEN, a town of Germany, in the circle of
Weffphalia, and county of Delmenhof: three miles
north-north-east of Delmenhorf.

HAS'BET, a town of Egypt, on the eaf! side of the
Nile, opposite Rosetta.

HAS'CAR, or HASH'GAR HOUT, a town of Chinefe
Tartary: 1310 miles west of Peking. Lat. 39. 34. N.
lon. 99. 32. E. Perro.

HAS'CHID-UB'E'KIL, an extenfive diithric of the
province of Yemen, in Arabia Felix, poffefed by a
number of confederated fchiechs. Its proper name is
Beliad el Kobatil, the High-country; but the other, ex-
preffive of the confederacy of chiefs, is the name by
which it is more commonly known. It extends north-
ward to the defert of Amala; on the north and the eaf! it
is bounded by the dominions of the Imam, and the
principality of Kaukeban; westward it meets the fove-
reign fale of Abu Arifh. The republican spirit previ-
ails fo little through Afa, that thefe fates may be re-
garded as a fingular political phenomenon in the eaf!.
This highland country contains many fchiechs, descen-
ded from very ancient noble families, each of whom rules
within his own dominions as a fovereign prince. The
fchiechs, finding themselves unable to make separately
any fuccelfful resistance to a powerful neighbour, have
combined, in order to defend themselves by their com-
mon force. These allied princes, and their subjects,
are much better soldiers, and more inclined to war,
thann the rest of the Albanis. The innum of Samo, and
the thers, have each reach several regiments, of
these highlanders, and pay them better than their
other troops. They have always officers of their own nation;
and the schieh usually both raise the regiments, and
nominate the officers. A tradition which subsists
concerning their common origin, may have been the cause
which first gave rise to the confederation among the
schiehs, and which has diffused them to maintain it
hierarchic. Hafchid and Befki, whose names the confed-
erates have assumed, were, by this tradition, brothers,
sons of a schieh named Babracham, by a princess called
Nedsjema. Babracham, who was born in Natolia, after
some romantic adventures, carried off that princes, who
was daughter to the king of Bithynia, and fought refuge
upon the mountains of Yemen; where, through his
sons, Hafchid and Befki, he became the ancestor of all
the schiehs of Bellad el Kobiá; and they accordingly
looked up to him as their common ancestor. The country
inhabited by these confederates is of various degrees of
fertility. Some valleys, which produce fruits in great
abundance, are interfpered among the hills; and even
the higher grounds are cultivated and fertile. A num-
ber of cattles are scattered upon the heights; but few
considerable villages are to be seen. The town of Kheiv,
in the district of the same name, is remarkable for
having been the seat, first of the Hamjare monarchs, and
afterwards of the imams. Ruins of a very ancient pa-
lace are still to be seen there. In four other villages
are several monuments, from which it appears, that
before the Turkish conquest, a great part of Bellad al
Kobéi was under the dominion of the ancient imans.
HASCK, or Hassek, a town of Arabia, in the prov-
cince of Hadramaut: 683 miles east-north-east of Mocha,
and 264 north-east of Fartach.
HASCURD, one of the smaller Shetland Islands of
Scotland, between Fitlar and Yell.
HASDE, a river of Germany, in the circle of Weft-
phalia, which rises near Brinke, in the bishopric of
Osnabruck, passes by Osnabruck, Bramche, Quaken-
b urg, Harfelin, &c. and runs into the Ems at Meppen.
HASE, (Theodore), a German protestant divine, born
at Bremen in 1638. After having received an excel-
 lent education under his father, who was a minifter, and
professor of theology in the university of Bremen, he was
sent in 1702 to the university of Marburg; and he after-
wards spent several years under the instructions of the
most celebrated professors in different German and Dutch
universities. In 1707 he was appointed professor of
belles-lettres at the university of Hanau; but in the fol-
lowing year was recalled to his native city, where he
received the appointments of minifter of the church of
St. Mary, and professor of the Hebrew language in the
university. In 1712 he was honoured with the diploma
of doctor of divinity by the university of Frankfort on
the Oder; and in 1718 he was chosen a member of the
Royal Society of Berlin. His lift promotion was to the
theological chair in 1723, which he filled with great re-
putation till his death in 1731, when only forty-nine
years of age. He was author of a collection of critical
Difertations, which were published after his death, in
one volume, 8vo, and are repeted with erudition.
HASEL, a river of Germany, in Franconia, which
runs into the Werra two miles south-east of Meinun-
gen, in the county of Henneburg.
HASELDORF, a town of Germany, in the duchy of
Hillenh: nine miles west of Pimmenberg.
HASELOCH, a town of Germany, on the Lower
Rhine: twenty miles north-west of Mainheim, and eight
north-north-east of Landau.
HASELOE, a small island of Denmark, in the Cat-
tegat: twelve miles from the island of Zeeland. Lat. 56°
11'. lon. 11. 45'. E. Greenwich.
HASENDORF, a town of Germany, in the arch-
duchy of Austria: six miles west-south-west of Tulln.
HASENMULLER (Daniel), a German writer, of
the sixteenth century, born at Eaut in Holstein, in
1571. His education in grammar learning he received at
his native town, and when he was fifteen years of age
was sent to prosecute his academical studies at Lubbeck.
In 1670 he removed to Kiel, where he sedulously
applied himself to the study of the oriental languages
under the learned Matthias Waufmuth. In 1675 he went
to the university of Leipzig, where in 1677 he was ad-
mitted to the degree of master of arts; returning after-
wards to Kiel, he was appointed to the professorship of
the Greek language in that university in 1683, to which
was added in 1688, after the death of Wausmuth, the
chair of Hebrew and the oriental languages. He filled
both these posts till his death, which happened in 1691,
just as he had completed his fortieth year. His works
are, i. Disertatio de Linguis Orientalibus, 1677, 8vo. 2.
Horror Opitis Synoyma Facilitati & Integratione Jectus,
1678, 4to. 3. Biblia parus Graece, in quibus dicta insinuata
omnia ex Versione Septuaginta et Tberaon Dec因而n Liberum
bibliorum observation in bibliis parvis Opitianis cum Caro exhe-
skensia, 1685, 12vo. 4. Disertation de linguis orientalis
Dialogus; Gilbertus Gontinianus praus Gracis edidit, &
cum Notis illoaractis, &c. 1688, 12mo. 5. Janua Hebraifmi,
aperta, cujus Parte i. Pracepta Grammaticae breviter, fide fiitul
triduit. ii. Vocabularium ftc fads plenum exhibetur. iii.
Textus Biblii continetur. iv. Dicifillorium omnis accurate reftrictus
v. Inflationis Accidituum faciendis & claris, cum duplicit
Attestationes Descriptas praegeb, 1691.
HASENAHN, a man's name.
HASES, a town of Egypt: fifteen miles south-east of
Tinche.
To HASE, v. s. (Hascher, Fr.) To mince; to chop
into small pieces and mingle:
He raised his arm
Above his head, and rain'd a form
Of blows to terrify his death.
As if he meant to haff her quick.
Hediras.
HASE, f. Meat cut in small slices and warmed a se-
cond time; a mixture.
HASEHABRIAHH, HASEHABNAH, HASEHRBHIAH,
HASEBADANAH, HASEHIM, HASEMONAH,
HASEHUB, HASEHUM, HASEHPHA, names of men
in the Old Testament.
HASEMONAH, the twenty-fifth place of encamp-
ment of the Israe!ites, in their journey from Egypt to
the Promised Land: xxxiii. 29, 30.
HASET, a water in Asia.
HASET, a river in Germany, 16. 6. 20', N. and 247.
48', W. It is navigable for flat-bottomed boats to the
duchy of Austria; eight miles west-south-west of Tulin.
HASETNAH, a man's name.
HASETH, a river of Palestine.
HASETNAH, a man's name.
HASETH, a village in Dalmatia: 34 miles north-west
of Split.
HASETH, a mountain on the coast of Scotland:
31. 6. 16', N. and 6. 38', W. It is 312 feet high.
HASETH, a town of Arabia, in the prov-
cince of Hanau.
HASETH, a river in Scotland, above which are
six bridges.
HASETH, a town in the province of the
Hebrides: 28 miles south-west of Obonhall.
HASETH, a river in Scotland, above which are
three bridges.
HASETH, a town in the county of Monm-
such: 26 miles south-west of Edinburgh.
HASETH, a river in Scotland, above which are
nine bridges.
HASETH, a town in the county of Monm-
such: 26 miles south-west of Edinburgh.
Hasselme has a weekly market on Tuesdays, and two annual fairs, viz. May 12, and September 25. It lies on the great road from London through Chichester to Portsmouth.

HASLET, or HASELET, f. [haffer, Islandic, a bundle; haffer, haffereus, haffier, Fr.] The heart, liver, and lights, of a hog, with the windpipe, and part of the throat to it.

Hasli, a district of Switzerland, in the canton of Berne. It is situated in a charming valley, fourth-east of the Lake of Lucerne, and watered by the Aar, and several smaller streams. The inhabitants put themselves under the protection of the Bernois in 1333. They are numerous, stout, well made, and warlike, and the women in general handsome. Their principal riches consist in the sale of cheese, of which they send great quantities to the ports of the northern seas.

Hay, s. [Háy, Sax.] Whence in some provinces it is yet called hápe.] A clasp folded over a flap, and fastened on with a padlock. Have your doors to open and shut at pleasure, with háps to them. Mortimer.

Te Hasp, v. n. To shut with a hasp.

Hasparan, a town of France, in the department of the Lower Pyrenees, and chief place of a canton, in the district of Udaritz; seven miles south-east of Bayonne.

Hasping, f. The act of fastening with a hasp.

Hassar, (Hebrew.] A man’s name.

Hassagay-tree, f. in botany. See Curtisia.

Hassan, or Hassan, grandson of Mahomet, and the most mild and peaceable of Mahommedan Khalifs.

Hasan, a town of Peria, in the province of Irak: twenty-seven leagues north-north-east of Amadan.

Hasan-Cala, a town of Aiatic Turkey, in the government of Erzerum, situated between mountains, which are covered in the month of November with snow, and seven miles north-east of Erzerum.

Hase (John Adolphus), an eminent musical composer, born at Bergedorff in Lower Saxony, about the beginning of the eighteenth century. He composed his first opera at eighteen years of age; and in 1745 went to Naples, where he studied under Porpora and Scarlatti. He composed some operas there, and also at Venice; and in 1750 he married the celebrated singer, signora Fañulli. Returning to Germany, he was made maestro di capella to Augustus king of Poland and elector of Saxony. He resided a long time at Dresden, where he had the entire management of musical affairs, and rendered the orchestra one of the most complete in Europe. The whole number of his opera-compositions exceeded a hundred. In the latter part of his life he removed to Venice, where he died in 1784.

Hasel, or Hasslaw, a town of Germany, on the Upper Rhine, and county of Hanau Monzenberg; eleven miles east of Hanau, and one south of Gelhauten.

Hassell, a met on the county of Hesse, Saxony, which runs into the Flaes; one mile west of Zeitz, in Thuringia.

Haselingen, a town of Germany, in the duchy of Holstein; three miles north of Mewe.

Hasselberg, a town of Germany, in the principality of Blankenburg; eleven miles south of Blankenburg.

Hasseln, or Hasselune, a town of Germany, in Thuringia, and bishopric of Munster; seven miles east of Meissen.

Hasselquist (Frederic), a Swedish botanist and traveller, born in the province of East Gothland in 1722, and studied medicine and botany in the university of Upsal. Linnaeus, in his lectures, had represented the extraordinary celebrity which a young student might obtain by travelling through Palestine, and by studying and describing the natural history of that country, which was, till then, unknown, and had become of the greatest importance to interpret the Bible, and to understand eastern philology. Hasselquist, fired with ambition to accomplish an object so important in itself, and so warmly recommended by his illustrious preceptor, was the first to offer his services in so important an undertaking. There being no fund arising from the liberality of the crown, private collections were made for the young traveller; and all the faculties of the university of Upsal granted him a stipend. Thus aided, he commenced his journey in the summer of 1749. By the interference of Lagerfroem, he had a free passage to Smyrna in one of the Swedish East-Indiamen. He arrived there at the conclusion of the year, and was received in the most friendly manner by Mr. Rydel, the Swedish consul. In the beginning of 1750 he set out for Egypt, and remained nine months at Cairo. Hence he went to Linnaeus, and to the learned societies of his country, with accounts of his researches. They were published, and met with the greatest approbation; and upon the proposal of dean Baec and Dr. Wargentin, secretary of the Royal Academy of Sciences at Upsal, a collection of upwards of ten thousand dollars was made for the continuance of the travels and researches of Hasselquist. Consequents Lagerfroem and Nordencrantz were the most active in raising subscriptions at Stockholm and Gothenburg. In the spring of 1751, he proceeded on his visitation, and passed through Jaffa to Jerusalem, Jericho, &c. He returned afterwards through Rhodes and Scio to Smyrna. Thus he fulfilled all the expectations of his country; but he was not destined to reap the reward of his toils. The burning heat of the arid deserts of Arabia had affected his lungs; he reached Smyrna in a state of indiglution, in which he languished for some time, and died February 9, 1752, when only in the thirtieth year of his age.

The fruits of his travels were, however, preferred through the liberality of great princes. He had been obliged to contract debts. The Turks, therefore, seized upon all his collections, and threatened to expose them to public sale. The Swedish conful prevented it. He fell, with the intelligence of the unhappy exit, off the road of the learned and his pupils, and threatened to expose his collections. They arrived afterwards in good preservation at Stockholm, together with his manuscripts, which were put into the hands of Linnaeus to methodize, and were published by him, in the Swedish language, in 1753, in 1 vol. 8vo. They have since been translated into several languages, and were published in English in 1766, under the title of Voyages and Travels in the Levant. The plants described are not numerous, but rare. The zoological remarks are interesting to the elucidation of natural history, and many facts in the work are explanatory of divers passages in Scripture. See Hasselquist’s Travels in the Levant, in memory of his pupil, Frederic Hasselquist, whose contributions to science form the subject of the preceding article.] In botany, a genus of the clafs pentandria, order diphylla, natural order of umbellata or umbelliferous. The generic characters are—Calyx: unbel spreading.
umbrellas ten, five of which are in the circumference; the rudiment of the central umbrella is a mortified vitiated body, pedicelled, somewhat three-sided,复查， deprived of all form, with hollow hairs involucral very small, five-leaved, subulate, reflex. Involucres hairless: those of the outer ones three-leaved, subulate, nodding, shorter than the umbellule; umbel when fruit-bearing converging. Corolla: flowers radiate, even of the inner umbellules; floccules of the ray hermaphroditic petals unequal, bowed in and bifid, the outmost petals two clefs, and the next single one large, (so that in each corolla there are four clefs large, and six small:) floccules of the inner disk male: petals nearly equal, bowed in and bifid; all the clefs small. Staminodes: filaments five to all the floccules, longer than the smaller petals; antherty roundifh. Filifhum: germ inferior; styles differ in number; stigma thick, smooth, white rim. Pericarpium: none. Seeds: outmost double, oval, smooth, the edge thicker, crenulate; inner solitary, hemispherical, drooping, pitcher-shaped, with the side hollow; these also are furnished with two styles; in the inner disk none.—Effential Character. Corolla, radiated, in the disk, male; floccules in the circumference double, with a notched edge; in the disk solitary, pitcher-shaped, hemispherical; (outer orbiculate, flat, inner bullate, Gartner.)

Species. 1. Haeffelquinia /Egyptiaca, or Egyptian haeffelquinia: leaves pinnate, leaflets pinnatifid. Root suffiform, smaller than the finger, white, annual. Stem a foot high, upright, round, white, with rough hairs. The outer seeds are of a pale straw-colour; the inner are naturally double as well as they, but one is hairs. The outer seeds are of a pale straw-colour; the inner are naturally double as well as they, but one is hairs. The outer seeds are of a pale straw-colour; the inner are naturally double as well as they, but one is hairs. The outer seeds are of a pale straw-colour; the inner are naturally double as well as they, but one is hairs. The outer seeds are of a pale straw-colour; the inner are naturally double as well as they, but one is hairs. The outer seeds are of a pale straw-colour; the inner are naturally double as well as they, but one is hairs. The outer seeds are of a pale straw-colour; the inner are naturally double as well as they, but one is hairs. The outer seeds are of a pale straw-colour; the inner are naturally double as well as they, but one is hairs.

Propagation and Culture. These plants are biennial, and, being natives of warm countries, are with difficulty preserved in England; for when the plants come up therefore to procure good seeds in this country, is to sow the seeds in pots about the middle of August, placing them where they may have the morning sun only, being careful to water them daily, to weed and thin them. In October remove the pots into a common frame, where they may enjoy the free air in mild weather, but be screened from frost. The spring following, if the plants are carefully turn out of the pots, and planted in the full ground, they will flower in June, and the seeds will ripen in August.

HASSION, f. In Jewish antiquity, the Jews who united under Mattathias to fight for the laws of God and the liberty of their country. See Assidians, vol. ii. p. 283.

HASSOCK, f. [cheek, Germ.] A thick mat on which performers kneel at church. Skinner.—In order to make them sit, it is usual in crosses, he gave every one a hafle and common prayer book. Addison.

HASSEL, a town of Germany, in Westphalia, and bishopric of Liege, situated on the river Remer, which divides it into two parts, one of which is in the county of Campine, the other in Lozé. Arnauld, comte de Chiny and Lozé, first surrounded it with walls, and gave it the privileges of a city. In 1567, the inhabitants revolted against the bishop of Liege, and received the reformation, with a minister of the reformed religion, named Herman de Swol, who converting others, they maltreated the ecclesiastics, pillaged the churches, and broke the images in pieces. The bishop, Gerard de Groebeek, not being able to bring them back to their obedience by good words, laid siege to the town, and compelled them to surrender, on condition, that the Roman Catholic religion should be re-establishd, and that the inhabitants should for the future keep a strong garrison at their own expense; sixteen miles north-north-west of Liege. Lat. 50, 54. N. lon. 22, 49. E. Ferro.

HASSEL, a town of Overisel, situated on the Vecht. In 1634, there happened a quarrel between the inhabitants of Deventer on one side, and those of Campen and Zwol on the other, in which Hassel was besieged and taken by the latter, for taking part with Deventer; but in about three years the differences were adjusted by the mediation of the states of Holland. The town is small but handsome, and endowed with many privileges by its ancient lords, the bishops of Utrecht, and confirmed by the emperor Charles V. in 1557. Its magistrates are four esheins and four councilours, changed every year: ten miles east of Campen. Lat. 52, 36. N. lon. 23, 29. E. Ferro.

HASSELWICK, a town of Norway, in the diocese of Drontheim: eighteen miles north-north-west of Drontheim. Hassi, a town of European Turkey, in the province of Macedonia: fifty-six miles north-north-west of Akrida.

HAST, the second person singular of haste.

HASTA, f. [Latin.] A pike, a spear, a javelin; any kind of offensive arms. Phillips.—It is also the name of a measuring rod.

HASTA, in some countries, is a measure or quantity of ground amounting to thirty paces; thus called, according to M. Du-Cange, from the hafa or rod whereby it was measured.

HASTATED, adj. Furnished with a spear; having a leaf like the head of a halberd.

HASTATTI, f. Soldiers armed with pikes; spearmen.

HASTATE-LEAF, /folium hastatum, Lat.] In botany, a leaf resembling the head of a halberd; triangular, hollowed at the base, and on the sides, with the angles spreading. It is exemplified in Rumex, and Scutillaria hastifolia. See also the Botany Plate IV.

HASTATUM, n. [hastatum, fr. hafle, Dut.] Hurry; speed; nimbleness; precipitation:

Spare him, death! But O, thou wilt not, can't not spare! Hast hath never time to hear. Crosw.

Patience; vehemence.—I said in my hafle all men are liars. Psalms.

"The more hast the worse speed." A very ancient proverb, intended as an admonition to those who hurry over the business before them, without taking that time and pains which is requisite to perfect or obtain the object in view; wherein the whole labour is lost, and the best of purposes oftentimes defeated. The Latins say, Qui nimium properat, sita absolut. The Greeks, H kai otopna to tepo trdni. The French, Qui trop se hache en cheminant, en bon chemin se faire vous vous savez. The Italians, Citroppo hafferti men noa. The English, Hast, or hasten. Fr. hafte, Dut.] To make hafe; to be in a hure; to be busy; to be speedy.—I have not hafened from being a paifor to follow thee. Jeremiah.—To move with swiftnes; eagerness; hurry; Cima, where hafe you fo I Shakespeare.—All those things are passed away like a shadow, and as a poll that was hafled by. Wifdom.

Hasting to pay his tribute to the sea, Like mortal life to meet eternity. Denham.
These rites performed, the prince, without delay, 
Hasten to the nether world, his destiny's way. Dryden.

Soon as the sun awakes, the sprightly court
Leave their repose, and hasten to the sport.

Prior.

To Hasten, or Hasten, v. a. To push forward;
to urge on; to precipitate; to drive a swifter pace:
All hopes of succour from your arms are past;
To save us now you must unour ruin hasten.

Dryden.

Each fits his lamp with different luftre crown'd;
Each knows his course with different periods bound;
And in his passage through the liquid space
Nor hastens, nor retards, his neighbour's race.

Prior.

Hasten's Ground, rocks in the Cattagat: 
about twelve miles north from the Island of Zealand.
Lat. 56. 11. N. Lon. 11. 45. E. Greenwich.

Hastenbeck', a town of Germany, in Lower Saxony, 
and principality of Calenberg, near which the
French, under the command of the Marechal d'Êftrées,
gained a victory over the duke of Cumberland, in 1757:
five miles south-east of Hameln.

Hastener, f. One that hastens or hurries.

Hastening, and Hast'ing, f. The act of mak¬
ing haste.

Hasting, n. [hast', a spear, and ludo, to play.]
Spear play; a bout at tilt or tournament.

Hastly, and Hastily, ad. In a hurry; speedily;
nimbly; quickly:
A voice that called loud and clear,
Come hither, hither, O come hastily! Spenser.

Rashly; precipitately.—Without considering con¬
sequences, we hastily engaged in a war which hath cost us
sixty millions. Swift.—Passionately; with vehemence.

Hastiness, f. Halte; speed. Hurry; precipita¬
tion.—A fellow being out of breath, or seeming to be
on the eve of fainting, sent to us an angry hastener told Baillie. Sidney.
—Rash eagerness.—There is most just caufe to fear, let
our hastiness to embrace a thing of so perilous confe¬
quence, should cause poverty to feel the woes of evils. Hooker.
—Angry tenseness; passionate vehemence.

Hastingia, f. in botany. See ABROMA.

Hasting's, [from hast']. A kind of apple; a 
kind of early pease.

Hasting's, a sea-port town in the county of Sussex, 
the chief of the cinque-ports; and sends two members to
parliament. Its distance from London is sixty-four miles;
from Rye, ten; East Bourne, eighteen; Winches¬
ters, seven; and Brighthelmstone, forty. It is go
ged over by a mayor, twelve jurats, and an indefinite number
of freemen. William the Conqueror march'd to this place with his army, immediately after landing at
Pevensey, and by him it was made one of the five ports, 
as lord Coke, in the fourth part of his Institutes, affirms.

After the conquest, the port of Hastings feems to have
been made the common passage from England to Norm¬
andy; for Matthew de Haftings held the manor of
Grenocle, in this county, of the king, by the service of
finding an oar whenever the king passed over the sea at
the haven of Haftings. The editor of the Saxon Chrono¬
icle states that a Danish pirate, Haftings, who used to
land here on his plundering expeditions, gave name to the
place; and among the ruins of the castles which ever
he went for these purposes, it is highly probable that
the preient castle was built on the site of one of his
ruin fortresses. It stands on a steep cliff above the sea: 
no part is entire; all that remains are disjoined walls,
and wall fragments scattered over various parts of the
beach: it is divided from the main land by a vall foss a hundred feet broad, and there are two others on the
eastern side. Over the beach hangs a projection sepa¬
rated from the castle by another foss. This evidently
seems to be the site of one of the Danilh forts of the
pirate Haftings.

Vol. IX. No. 582.

Hastings was certainly a flourishing town long before
the Norman invasion; for it appears that king Athelstan,
who reigned between the years 925 and 932, had here a
royal mint. After the conquest, king William bestowed
Hastings, and the whole rape or hundred which bears the
name of on Robert earl of Erle, descended from a
natural fon of Richard I. duke of Normandy. This
name gave name to the great family of the Haftings, afterwards
earls of Huntingdon. The first was Robert, portrerge of
the town, and steward to the Conqueror. They flour¬
ished from that time till the death of the laft in 1759.
The town and liberty consists of three parishes, though
there are but two churches, St. Clements and All Saints;
the first decorated with a tower of neat tasteful work.
The priory of Austin Canons stood behind the castle;
but not a vestige of the building is to be seen: it was
founded, as is laid, by Sir Walter Brictet, in, or perhaps
before, the time of Richard I. The original building
was washed away by the sea, and afterwards replaced
on its late site. In the town is a small manufactur of thin
silks; but its chief support is its fishery of herrings, mackerel,
and foles. The first begins in November, and lasts
until Christmas; about forty vessels are employed, and
about two hundred men, who go out four or five leagues
cozing during the seafon, and they afford a consid¬
erable supply to the London market. Near the castle are
some lime-kilns of a most magnificent size and structure. The
line is no small article of commerce, and made of the
chalk brought from Beach-y-head, in boats of from thirty
to forty tons burden.

The port of Haftings had charters from Edward the
Confidor, William I. Henry II. Richard I. Henry III. Edward I. and Charles II. but it was burnt by the
French in the reign of Richard II. after having been
plundered by them. It has sent members to parliament
ever since Edward III. The town is built in a pleasant
vale between two hills, with a rivulet called the Bourne
erunning through it. The number of houses is but few;
but at fix hundred, and the inhabitants at three thou¬
sand. The town is endowed with two noble charities, under
the wills of James Saunders and William Parker, by
which are founded two free-schools for the instruction
of 130 scholars in the several branches of literature and
religious education, placing poor boys apprentices, &c.
It is very remarkable that there is not a single difliner
from the church of England, nor is there a copyhold ten¬
ure, in the town. The salubrity of the air, the retired
situation, and the good accommodations, render it equal,
if not preferable, to any place on the coaft for fer¬
bathing, and in confequence it is become a favourite
resort of invalids, which is called the Spa, and is fas¬
tiful, is held on Wednesdays and Saturdays; and there
are three fairs annually, one called Rock-fair, held July
26, the others called the Town-fairs, held on the 23d
and 24th of October, and on the Tueday and Wednes¬
day in Whit-fun-week.

The harbour of Haftings, though formerly so famous,
is now only a road for small vesfles, it having been ruin¬
ed by the storms which, from time to time, have been
so fatal to the neighbouring ports of Rye and Winches¬
ters; and it still continues a very indifferent one, though
great sums have been laid out in order to recover it.
On the rocks near Haftings grow quantities of the
coral animals of the Actinia genus, called Actinia, and
Animal flowers, &c; for figures and a description of which, see the articles
ACTINIA, and ANIMAL FLOWER, with the correp¬
pondent Engravings, in our First Volume.—The cliffs along
the coast, from the west side of Wincheffers to Haftings,
confist of flinting, with a high beach at their base; that
on which the castle stands, of a land-done mixed end
slime, split into figures and vast gaps. The view to¬
wards Beachy-head is of a great curvation, with a high
beach; the land near the shore flat, but rising, four or
five miles inland, into lofty downs. Upon one of these
downs the memorable and decisive battle was fought
between William the Conqueror, and Harold king of England; for the events of which see the article England, vol. vi. p. 553.

HASTINGS BAY, a bay of the island of St. Matthew, in the Archipelago of Mergui, in the Indian sea, and the China Sea.

HASTINGS, a town of France, in the department of the Landes, ten miles south of Dax.

HASTY, adj. [hasty, Fr. from hast; hastig, Dut.] Quick; speedy; passionate; vehement. —He that is flow to wrath is of great understanding, but he that is hasty of spirit exalteth folly. Proverbs. —Rash; precipitate.

Hast thou a man that is rash with thy mouth, and let not thine heart be hasty to utter any thing before God. Eccl. v. 2. —Early ripe.

Beauty shall be a fading flower, and as the hasty fruit before the summer. Isaiah.

Utter any thing before God. Eccl. v. 2. —Early ripe.

Beauty shall be a fading flower, and as the hasty fruit before the summer. Isaiah.

HASTY PUD'RING, f. A kind of pudding made of milk and flour boiled up quick together.

HAT, [hat, Sax. hat, Germ.] A cover for the head, with a brim, which distinguishes it from a cap, or a bonnet.

—His hat was like a helmet, or Spanish montero. Bacon.

Hermes o'er his head in air appear'd, And with soft words his drooping spirits cheer'd; And in his hand he bore the sleep-compelling-rod. —His hat adorned with wings did clo's the god,

And in his hand he bore the sleep-compelling-rod. Dryd.

The manufacture of hats is of late years become a great object of national commerce; and the improvements made therein are considerable.

The materials for making hats, are rabbits fur cut off from their body, together with wool, and beaver; to which have been lately introduced mole fur, and kid hair. These are mixed in various proportions, and of different qualities, according to the value of the hats intended to be made; but the beaver is now wholly used for making the finer hats, and not for the body or main cloth. Experience has shewn, that the hair or fur cannot be evenly and well felted together, unless all the fibres be first separated, or put into the fame flate with regard to each other. This is the object of the first process of hat-making, and is called bowing. The material is laid upon a platform of wood, or of wire, about four feet square, called a hurdle, which is fixed against the irrmural wall of the workshop and is enlightened by a small window, and separated by two side partitions from other hurdles, which occupy the rest of the space along the wall. The hurdle, if of wood, is made of deal planks, not quite three inches wide, disposed parallel to the wall, and at the distance of one-fortieth of an inch from each other, for the purpose of stiffening the material of the stuff, to pass through; a purpose still more effectually answered by the hurdle of wire.

The workman is provided with a bow, a bow-pin, a basket, and several cloths. The bow is a pole of yellow deal or ash, about seven feet long, to which are fixed two bridges, somewhat like that which receives the hair in the bow of the violin. Over these is stretched a cat-gut, about one-twelfth of an inch in thickness. The bow-pin is a flick with a knob, and is used for plucking the bow-string. The basket is a square piece of ozier-work, confisting of open straight bars with no crofting or intertwaving; its length across the bars two feet, and its breadth eighteen inches. The sides into which the bars are fixed are slightly bent into a circular curve, so that the basket may be set upright on one of these edges near the right-hand end of the hurdle, where it usually stands. The cloths are linen. Besides these implements, the workman is also provided with brown paper.

The bowing commences by shovelling the material towards the right-hand partition with the hurdle, on which the workman, holding the bow horizontally in his left-hand, and the bow-pin in his right, lightly places the bow-string, and gives it a pluck with the pin. The firing, in its return, strikes upon the fur, and causes it to spring up in the air, and fly partly across the hurdle in a light open form. By repeated strokes, the whole is thus subjected to the bow; and this beating is repeated till all the original cloths or muffs of the filaments are hardened and stiffened, having thus been twisted together in all possible directions, form a thin mass or substance for the felt. The quantity thus treated at once, is called a batt, and never exceeds half the quantity required to make one hat.

When the batt is sufficiently bowed, it is ready for hardening, which denotes the firft commencement of felting. The prepared material, being evenly disposed on the hurdle, is first pressed down by the convex side of the basket, then covered with a cloth, and pressed forwards andwards succedentially in its various parts, by the hands of the workmen. This preflure brings the hairs closer to each other, and multiplies their points of contact; the agitation of them gives to each hair a progressive motion towards the root; by means of this motion the hairs are twisted together, and the lamella of each hair, by fixing themselves to those of other hairs which happen to be directed contrary way, keep the whole in that compact state which the preflure makes it acquire. See the article hats, &c.

Upon this same disposition of the hairs in felting, the hair-balls, or aggropilia, formed in the flomachs of hairy animals which lick themselves, are alone to be accounted for. See Aggropilia, vol. i. p. 134. In proportion as the mass becomes compact, the preflure of the hands is increased; not only to make it more close, but also to keep up the progressive motion and twirling of the hairs, which then takes place with greater solidity: but throughout the whole of this operation, the hairs fix themselves only to each other, and not to the cloth with which they are covered. It may here be proper to explain why that hair which is intended for making hats is always cut off with sharp instruments, (although that cannot be done without losing a part of its length,) and not plucked out by the roots, as might be done after softening the skin; the reason is, the bulb of the hair, which in the latter case would come out with it, would render that end which was fixed in the skin thick and obtuse; and it would consequently be less disposed to introduce itself among the contiguous hairs, and to contribute by its progressive motion to the texture of the mass. But this conformation of the surface of hairs and wool, is not the only cause which produces their disposition to felting. It is not sufficient that every hair poifeeses the before-mentioned tendency to move progressively towards the root, and that the mass, viewed as a whole, is pressed lamella, by hooking themselves to each other, preserve the mass in that state to which compression has brought it: but it is also neceffary that the hairs should not be straight, like needles; for if they were so, pressing and rubbing them together would merely cause them to move from the centre of the mass, without producing the requisite compactness. Every hair must therefore be twisted or curled in such a manner that the extremity which is towards the root may be disposed to change its direction perpetually, to twist itself about other hairs, and to incline towards them; and the effect of these operations would only be to make them move from the centre of the mass, without producing the requisite compactness. Every hair must therefore be twisted or curled in such a manner that the extremity which is towards the root may be disposed to change its direction perpetually, to twist itself about other hairs, and to incline towards them; and the effect of these operations would only be to make them move from the centre of the mass, without producing the requisite compactness. Every hair must therefore be twisted or curled in such a manner that the extremity which is towards the root may be disposed to change its direction perpetually, to twist itself about other hairs, and to incline towards them; and the effect of these operations would only be to make them move from the centre of the mass, without producing the requisite compactness. Every hair must therefore be twisted or curled in such a manner that the extremity which is towards the root may be disposed to change its direction perpetually, to twist itself about other hairs, and to incline towards them; and the effect of these operations would only be to make them move from the centre of the mass, without producing the requisite compactness.
confiting of a kettle (con-
folding, the felt becomes firmer and firmer, and contracts
progresive action of the filaments in felting, and to join
want of labour. This, in handling the dry grey hat when
open the body again—by throwing in a handful of oat¬
the two together. Many hatters, to hurry this work,
the same time they leave them quite grainy from the
femented of leather, alumed or half tanned, should be ufed
or
harden¬

A superior method is said to be, that after the
point being returned back again in the same manner,
be done, is to give it the form required by the wearer.

The beaver for the nap is laid on towards the conclu-
sion of this kind of working. The hat now possesses
the form of a cone, and the whole of the several actions it
undergone have converted it into a soft flexible felt, capa-
cable of being extended, though with difficulty, in any
in every direction; therefore the next thing to be
soned agitation and pressure, the cloth is taken off, and
a flat central portion of the felt, and by forcing a
firing down the sides of the block, he causes the next
part to assume the figure of the crown, which he con-
tinues to wet and work, until it has properly disposed
itself round the block. The brim now appears like a
piece wet with the liquor, pulls out the point with his
fingers, and presses it down with his hand, at the same
time turning it round on its centre in contact with the
plank, till he has, by this means, rubbed out a flat
portion equal to the intended crown of the hat. In the
next place, he takes a block, to the crown of which
applies the flat central portion of the felt, and by forcing
a firing down the sides of the block, he causes the next
part to assume the figure of the crown, which he con-
tinues to wet and work, until it has properly disposed
itself round the block. The brim now appears like a
flounced or puckered appendage round the edge of the
crown; but the block being set upright on the plank,
the requisite figure is soon given by working, rubbing,
and extending this part. Water only is used in this
operation of fashioning or blocking; at the conclusion
of which it is pressed out by the blunt edge of a copper
implement used for that purpose.

Previous to the dying, the nap of the hat is raised or
loosened out with a wire brush, or carding instrument.
The fibres are too rotten after the dying to bear this
operation. The dying materials are logwood, a little
oak-bark, and a mixture of the sulphates of iron and of
copper, known in the market by the common names of
grounds and extending this part. Water only is used in this
operation of fashioning or blocking; at the conclusion
of which it is pressed out by the blunt edge of a copper
implement used for that purpose.

vent the glue from coming through to the face, and also to give the requisite firmness at a less expense than could be produced by glue alone. Were the glue to pass through the hat in different places, it would be more difficult to produce the requisite firmness at a less expense than could be produced by glue alone. Were the glue to pass through the hat, the crown of which is notched, or flat open in various directions. There are then placed on the bottom of a deal board, which supports the hat, and the glue is applied with a brush. In France, however, they use wine-lees in lieu of beer-grounds, and gum-water instead of glue.

The dry hat, after this operation, is always rigid, and its figure irregular. The last dressing is given by the application of moisture and heat, and the use of the brush, and a hot iron, as before mentioned, somewhat in imitation of beaver. The ars of cutting them round, is very ingenious and simple. A number of notches are made in one edge of a flat piece of wood for the purpose of inferring the point of a knife; and from one side or edge of this piece of wood there proceed a straight handle, which lies parallel to the notched edge, forming an angle somewhat like that of a carpenter's square. When the legs of this angle are applied to the outside of the crown, and the board lies flat on the brim of the hat, the notched edge will lie nearly in the direction of the radius, or line pointing to the centre of the hat. A knife being therefore inserted in one of the notches, it is easy to draw it round by leaning the tool against the crown, and it will cut the brim very regular and true. This cut is made before the hat is quite finished, and is not carried entirely through; so that one of the last operations consists in tearing off the redundant part, which by that means leaves an edging of beaver round the external face of the brim. When the hat is completely finished, the crown is tied up in gauze paper, which is neatly ironed down. It is then ready for the subsequent operations of lining, f. c. for sale.

Mr. John Clennell, of Newcastle-upon-Tyne, has published some valuable observations, in Nicholson's Philosophical Journal, as well as in his History of Hat-making, on the probable gain or loss of employing machinery in the manufacture. These observations are worthy of the serious attention of every judicious hat-maker, who carries on his business on a large scale; for he will find them not the reveries of a rash speculator, but the cool reflections of a philosopher, who is at the same time no stranger to the arts of life. They suggest the following subjects of enquiry: Whether carding, which is rapidly and mechanically done, be inferior to bowing, which does not promise much facility for mechanical operation? Whether a succession of baths or cardings might be thrown round a fluted cone, which rapidly revolving in contact with three or more cylinders, might perform the hardening, and even the working, with much more precision and speed than they are now done by hand? Whether the whole of these processes extremely well calculated for the operation of one or more machines? Whether loose weaving and subsequent felting might not produce a lighter, cheaper, and stronger, article? And how far the mechanical felting, which is not confined merely to the hairs of animals, might be applied to this art?

When felt hats are to be dyed of any other colour than black, the processes are as follows: As soon as the hat is to be raised by means of a card, or the side intended to be dyed, as for instance, green, either at top or bottom; it is then to be boiled in alum argol. A thin paste of flour, or clay, is spread over every part that is not to receive the dye, and then closed; or the hat may be previously pasted, and instead of being boiled, it might only be simmered in the liquor that supports the glue, like a common funnel, are fixed over the paste, to prevent the dye from penetrating through. In this state the hat is immersed in the dye, till the colour be sufficiently fixed; when it is taken out, opened, and cleansed from the paste; but, if any colouring particles have penetrated through the felt, they may be removed by rubbing them with a small quantity of spirit of salt, aquafortis, c. The compounds employed in this dye, are: fufiric, turmeric, ebony, faffron, alum, indigo, and vitriol, with urine or pearl-ash, at the option of the dyer; and which are to be used according to the colour required. Among the most recent improvements in the manufacture of hats, we have to notice an invention of Mr. George Durnaghe, who, in 1793, obtained a patent for making water-proof hats, in imitation of beaver. The articles he employs are similar to those used for the making of common hats, with which he mixes Bergamot or Orange-wine, &c. These are dried and worked in a peculiar manner; and finally coated with a strong varnish impenetrable by water. The reader will find the patentee's specification inserted in the fourth volume of the Repertory of Arts. The same manufacturer procured another patent in November 1798, for a method of ventilating the crowns of hats. This invention consists in separating the top from the sides of the crown, so that the tip, or top-crown, may be either raised or let down at pleasure, in order to admit the external air, or to exclude it from circulating in the crown of the hat. The whole contrivance is effected by means of springs, sliders, grooves, and loops, which are connected with the top and side crown; thus the admission or exclusion of the air, in front, behind, or on either side, may be regulated accordingly. This invention is also described in the tenth volume of the work above quoted.

The following is the specification of a patent granted to Meffrs. Walker and Alleph, for making and manufacturing caps and hats, and rendering them perfectly waterproof; as also of the kinds of leather, satin, silks, fluffs, and other substances intended for women's hats, bonnets, shoes, &c. as to be used on all occasions, where the repelling of wet or moisture may be desirable. It is dated November 3, 1801, and the patentees describe their process to be as follows:

"For the manufacturing of our new-invented caps, which are principally intended for the use of the military, we take suitable pieces of pasteboard, and cover both sides thereof with linen cloth, or any other texture. Furthermore, we take pieces of pasteboard, and cover both sides thereof with linen cloth, or any other texture. Furthermore, we take pieces of pasteboard, and cover both sides thereof with linen cloth, or any other texture. Furthermore, we take pieces of pasteboard, and cover both sides thereof with linen cloth, or any other texture. Furthermore, we take pieces of pasteboard, and cover both sides thereof with linen cloth, or any other texture."
the cap, together with the cape behind, agreeable to the quality and fashion ordered to be made, is also to be painted, japanned, or varnished, on one or both sides, as may be thought necessary. When the peak or rim, together with the cape and lining, are affixed to the crown, the nails the wire, and it is then to be painted, japanned, or varnished, on one or both sides, as may be thought proper to affix to the same. Men's hats are made in the same manner, and with the same materials, as the crown of the cap, except being principally covered with silk, linen, cotton, or other texture, wrought in a loom, cemented to the paperboard in like manner as described for the cap. And also except that such breadth is given to that side or inner part or edge of the flap, or brim, that is next the crown, as will admit of its being notched and turned up, so as to lie close to the side of the crown, and to be united thereto by sewing. And, with the same cement as applied to the cap, the parts so turned or bonnet, or to perform any flat work, take a sheet of pasteboard, silk, linen, cotton, stuffs, or any other texture wrought in a loom, intended for waterproof shoes, gaits, women's hats or bonnets, &c. are to be painted, japanned, or varnished, on one or both sides, in like manner as the articles before specified."

**Straw Hats and Bonnets** have of late years taken a decided lead among the fashions of the day, which their simple elegance and lightness of wear indisputably warrant; besides that it is encouraging our home manufacture, instead of that of Leghorn. The art of making straw into hats, bonnets, &c. which takes off its brittleness, and makes it work uniformly, is both easy and ingenious. Mr. Boileau, of Bruton-street, Hanover-square, obtained a patent for the manufacture of straw into hats, bonnets, &c. which he describes to be as follows: "I prepare the straw, by separating it at each joint, and taking off all the outside skin or covering. One end must be cut pointed, in the form of a taper, so that it may be inserted into the hole of another, as it is worked. It must then be immerged in water, so that the water may pass through its tube; which takes off its brittleness, and makes it work uniform, so as to take the shape of the block, and yet preserve its natural shape. After the straw is thus prepared, if it is to be made of wood, or other article, as of the form or shape of the crown of the hat, bonnet, or other article you propose to make; and, at the top of it, from the centre, describe a small circle; from that circle, draw perpendicular, serpentine, diagonal, or other lines or curves, as fancy may dictate. As those lines or curves form the ribs or separations of the work when complete, at the top of each of these lines or curves where they touch the circle, fix a small nail, or pin; to which fasten a double wire, covered or uncovered; which wire must be twice the length of the line or curve, and tied or fastened to the nail, or pin, just in the middle of the wire, that there may be two equal ends of wire to work. Begin working, by introducing the pipe or quill straw between the two wires; which wire must be drawn tight, and even with the line or curve. Repeat the same at every line or curve round the block; that is to say, let one wire go over, and the other under, the straw, at every line or curve. To the end of it join the straw, by introducing the sharp end of another straw into the former, and as the line or curve is drawn through the bottom of the block. To make the brim of the hat or bonnet, or to perform any flat work, take a sheet of thick pasteboard, and, after drawing the circle (for a hat or bonnet) formed by the bottom of the crown, and for other flat work at will, draw lines or curves, according to fancy, as before; and, instead of nails or pins, as described to be fixed into the block, make two small holes at the top of the lines or curves on the circle, through which the wire may be passed, and the extremity fastened to the nails or pins. When finished, the brim is to be fewed, or otherwise fixed, to the crown; or it may be continued to be worked on the pasteboard to the crown, so that the hat or bonnet shall be all in one piece, without separation. Fix or place, in the space left by the wire at the top of the crown, a device of draw, or any other ornament, and likewise round the edge of the brim, when the work will be complete. It may be observed, that, being worked with wire, a variety of form or shape may be obtained, without injury to the work."

Mr. Corfion of Ludgate-hill has communicated, in the Transactions of the London Society of Arts, &c. vol. 23, for 1805, an account of his having succeeded in manufacturing plait for hats of rye-straw, raised on poor land, equal to the finest foreign plait. Persons who have dealt many years in this article, attest that they could not distinguish this home manufacture from the very best Italian Legotto.

The duty on felt hats commenced October 2, 1784, by flat. 24 Geo. III. c. 51, viz.

And by the flat. 36 Geo. III. c. 125, it is enacted, that, after August 5, 1796, the above duty shall be calculated according to the full price of the hat, and of all the mountings and other ornaments (except gold and silver lace) fixed therewith. And every hat made wholly of felt, wool, stuff, beaver, or leather, or any mixture therewith, shall be liable to the duties. And every such hat shall, previous to the sale and delivery, be lined or covered in the inside of the crown with silk, linen, or other proper materials, with a durable stamp affixed thereon to denote the above duties.

And, after August 5, 1796, if any person (other than licensed dealers buying hats of other licensed dealers) shall receive on sale, or if any person shall, after April 5, 1797, wear or use, any hat wherein no lining or inside covering shall be affixed, or if the lining or covering shall not be stamped according to this act, or not have the stamp placed therein in a visible manner, every such person shall forfeit ten pounds. And no person (other than licensed dealers selling to other dealers) shall sell or exchange any hat wherein no lining or inside covering shall be affixed, or wherein there shall be a lining that shall not be stamped, or that shall not be stamped with a stamp placed in the inside of the crown so as to be visible, or shall be stamped with a stamp of less value than required, on pain to forfeit ten pounds.

Perons carrying about hats for sale without any lining, or with a lining not duly stamped, may be apprehended and carried before a magistrate, and the apprehender, on conviction of the offender, is to be entitled to forty shillings; and the offender in such case is to be committed to the house of correction for not exceeding the usual term of forty days, and if the offender shall take out of any hat the stamped lining after the fame shall have been used or worn, with intent to affix the same to any other hat, or shall affix any such flat. 6
HAT

flamed lining after the same shall have been used or worn, such cushions shall forfeit twenty pounds.

HATTA HOTUN, a town of Chinese Tartary. Lat. 35° 10'. E. Ferro.

HATACH, [Heb. a striker.] A man's name:

HATAI'NAN KIA'MEN, a poft of Chinese Tartary; thirty-five miles north-west of Telticottar Hotun.

HAT'BAND, f. A firing tied round the hat.—They had hats of blue velvet, with fine plumes of divers colours, fet round like hatbands. Bacon.

HAT'BOX, /. A flight box to put a hat in.

HAT'CASE, f. A flight box for a hat; an oiled clotb to put over the hat.

To HATCH, v. a. [haken, Germ. as Skinner thinks, from hecken, v. a. to cut, hatchen, eghen; a small axe. The hatchet is to hew the irregularities of flax is. beaten. The hatchel or hatchet is to hew out of a block by a hatchet; an ape his own dear image will embrace: An ugly bean adores a hatchet-face. Dryden.

HATCH'ETCH-VETCH, f. in botany. See CORONILLA.

HATCHING, f. The act of producing young from eggs, whether by the incubation of the parent bird, or by artificial means. In some countries, the production of chickens by an artificial process, constitutes an extensive and lucrative trade; for the methods of which, see the article EGG, voL. vi. p. 295.

HATCHMENT, f. [corrupted from achievement. See ACHIEVEMENT.] Armorial escutcheon placed over a door at a funeral. See the article HERALDRY, in this volume.

Hat's means of death, his obscure funeral; No trophy, sword, nor hatchment, o'er his bones, No noble rites nor formal ollentation, Cry to be heard. Shakespeare.

HATCHWAY, f. The way over or through the hatches.

HATCHY, a navigable river of the American States, in the state of Tenesee, runs westerly into the Mississippi, about nineteen miles north of Wolf river; and seven miles from its mouth is about eighty yards wide.

To HATE, v. a. [hazian, Sax.] To detest; to abhor; to abominate; to regard with the passion contrary to love:—

You are, I think, affur'd I love you not.

Your majesty hath no just caufe to hate me. Shakespeare.

Do all men kill the thing they do not love?

Hates any man the thing he would not kill?

Every offence is not a hate at first. Shakespeare.

HATE, f. [see, Sax.] Maliciousness; malice; the contraries to love:

Speak then to me, who neither beg nor fear Your favours nor your hate. Shakespeare.

HATEFUL, a. J. That which causes abhorrence; odious; odious; odiously; abominable; detestable. There is no vice more hateful to God and man than ingratitude. Peacham.

But Umbriel, hateful gnome! for bears not so; He breaks the phial where the流es flow. Pope.

That which feels abhorrence; abhorrent; detestable; odious; odiously; abominate; malignantly; malevolently.

That no more to try the fortune of the field; And, worse than death, to view with hateful eyes His rival's conquest. Dryden.

HATEFULLY, adv. Odiously; abominably. Malignantly; malignantly; malignantly. They shall deal with thee hateful, take away all thy labour, and leave thee naked and bare. Ezek. xxiii. 29.

HATEFULNESS, f. Odiousness.

HATER, f. One that hates; an abhorrer; a detester. —An enemy to God, and a hater of all good. Brown.

HATFIELD, or BISHOP'S HATFIELD, a small town in Hertfordshire, distant seven miles from Hertford, and twenty from London. It takes its latter name from having once belonged to the bishops of Ely, who had a palace here, which, with the manor, became alienated to the crown in the reign of queen Elizabeth, who occasionally resided here, and was hence conducted to be crowned at London. James I. exchanged this royal demesne
demeane for Theobalds, with Sir Robert Cecil, afterwards Earl of Salisbury. Here are two charity-schools, and two Sunday schools, one for boys, and the other for girls. The market day is on Thursdays; fairs April 23, and October 18. Near this town are the elegant seats of the Duke of Leeds, the Earl of Salisbury, and Lord Viscount Melbourne.

Hatfield Heath, or King's Hatfield, and township of Ely, eight miles from Dunmow, and twenty-nine from London. It is so called, from its tenure under William the Conqueror and his successors, and from a broad oak growing in the town. The market is on Saturdays; fair on August 5.

Hatfield, a very pleasant town of the American province of New England, Massachusetts, situated on the west bank of a branch of Connecticut river, where it is eighty rods wide, five miles north of Northampton, and one hundred west of Boston. It lies chiefly in one street, and contains 703 inhabitants. Here are two ferries; the one to Hadley, the other to Amherst. North of the ferry to Amherst, the river meets with a bed of rocks, which renders its breadth twenty or thirty rods; no full, but a large eddy at high water.

Hath, third perf. fing, of have, v. a. Possessed; held; regarded.

Hath, a sign of the past tense, third perf. sing, of have, v. n. Hath now, hath indeed.

Hatherleigh, or Hatherley, a town of Devon, seven miles from London, twenty-eight from Exeter, eighteen from Bideford, and twenty-two from Barnstaple. It is seated on a branch of the river Towbridge, near its confluence with the Ock. Its inhabitants are chiefly employed in the woollen manufactury, and in agriculture. It has a market every Tuesday and Friday; and four annual fairs, viz. May 21, June 22, September 4, and November 8. There is also a great market held on the Friday that happens nearest the 21st of March in every year, at which there is as great a show of cattle as at either of the fairs.

Hating, f. The act of detesting.

Hattita, [Hebrew.] A man's name.

Hatmaker, f. One whose trade is to make hats.

Hatred, f. Hatred; ill-will; malignity; malignity of God. It was one of their distinguishing tenets, that God does not punish man for his sins, but by the sins. Thrice two feet, says Mosheim, still sufficent, though they no longer bear the names of their founders.

Hattin, a town of the kingdom of Holland, in Guelderson, situated on the IJssel, taken by the French in the year 1672, which destroyed the fortifications: thirty miles north of Deventer, and nine south-east of Kampen.

Hatten, a town of France, in the department of the Lower Rhine; seven miles northeast of Haguenau.

Hattenheim, a town of Germany, in the circle of the Lower Rhine; and electorate of Mentz, situated on the Rhine; twelve miles west of Mentz.

To Hatter, v. a. [corrupted from batter.] To harass; to weary; to wear out with fatigue. He is hatter'd out with penance. Dryden.

Hatter, f. A maker of hats; a felter.

Hatteras, a most remarkable and dangerous cape on the coast of North America. This point extends far into the ocean, from the coast of North Carolina, in lat. 35. 15. N. The water is very shoal at a moderate draught, not above half that extent. Oil the south-east part of these is about ten feet at low water; and here, at times, the ocean breaks in a most tremendous manner, spouting, as it were, to the clouds, from the violent agitation of the Gulf Stream, which touches the eastern edge of the banks, from which the declivity is so perfectly deep, that is far from ten fathoms to the foundings. On the spot above-mentioned, which is firm land, it has been the lot of many a good vessel to strike, in a gale of wind, and go to pieces. In moderate weather, however, these shoals may be passed over, if necessary, at full tide, without much danger, by vessels not drawing more than nine or ten feet water. From this bank, formerly of vast extent, and called the Polt Mene Skoal, a ridge runs the whole distance to the cape about a north-west course, is about half a mile wide, and at low water has generally from ten to twelve feet water. There are gaps at equal intervals, affording channels of about fifteen or sixteen feet water. The most noted of these is about a mile and a half from the land, and is at least two miles and a half wide, and might at full sea be safely passed by the largest ships; but is rarely used except by coasting-vessels. It may be easily known by a range of breakers always seen on the west side, and a breaker head or two on the eastern side; which, however, are not to constant, only appearing when the sea is considerably agitated. A little north of the cape is great anchoring in five fathom water, with the wind westward, a boat may land in safety, and even bring off casks of fresh water, plentiful of which is to be found every where on the beach, by digging a foot or two, and putting a barrel into the sand.

Hattering, f. Wearying; fatiguing.
HATTERSTORF, a town of Germany, in the archduchy of Austria, eleven miles east-south-east of Laub.

HATTIL, [Hebrew.] A man's name.

HATTINGEN, a town of Germany, in the circle of Westphalia, and county of Mark: fifteen miles north-east of Bonn, Lat. 51° 22' N- Ion. 34° 34' E. Ferro.

HEATIPH, Hebrew. A man's name.

HATTOCK, f. [tacket, Espe.] A thock of corn.

HATTONCHATEL, a town of France, in the department of the Meuse, and chief place of a canton, in the district of St. Mihiel: fifteen miles north-east of the Meuse, and chief place of a canton, in the district of St. Mihiel: two leagues and three quarters north-east of St. Mihiel: and four and a half west-north-west of Douai.

HAT'TUSH, Hebrew. A man's name.

HATVANY, a town of Hungary, twenty miles north-east of Buda.

HATZFELD, a town of Germany, in the circle of Hatzenpflie, and principality of Upper Hesse: nineteen miles south-west of Waldeck, and thirty-fix south-west of Caffel. Lat. 50° 50' N- Ion. 9° 26' E. Ferro.

HAVANAH, a sea-port town of Spanish America, in the island of Cuba, situated on the north-west part of it, opposite to Florida. It is famous for its harbour, which is in every respect one of the best in the West Indies, and perhaps in the world. It is entered by a narrow passage, upwards of half a mile in length, which abounds in banks, and leads into a large basin, forming Cul de Sac, and is sufficient, in extent and depth, to contain one thousand fall of the largest ships, having almost throughout six fathom water, and being perfectly covered from every wind. The town was built by Diego de Velagez, who conquered the island of Cuba for the king of Spain. It was but a small place, and named originally the port of Carenas; but afterwards, when the king of Spain took it, it was called St. Christopher of the Havannah, and was esteemed the key of the West Indies. It is now a magnificent city. The buildings are elegant, mostly of stone, and some of them most superbly furnished. Here are eleven churches and monasteries, and two handsome hospitals. Near the centre of the town is a spacious square, surrounded with uniform buildings. The churches are rich and magnificent; the lamps, chandeliers, and ornaments for the altars, being of gold and silver. It is not a bishop's see, though the bishop of St. Jago resides here. In 1790 the inhabitants were computed at 26,000, since which they have considerably increased. Presently, they are at about 50,000. This is more than the inhabitants of any of the Spanish towns on the continent; and very much imitate the French both in their dress and manners. The town is supplied with water by a small river called Lagisa, which rises from the hills on the south-west side of the town, and divides itself into three streams, one of which falls into the sea on the east side of the town, but the other two flow through the place, entering the wall near the middle of the town.

The fortifications are the strongest in this part of the world. The entrance into the harbour is defended on the east side by a strong castle called El Moro, situated on a high rock; and on the walls and bastions are mounted forty pieces of cannon. Under the faces of the south-west bastion of the Moro, and more within the entrance of the harbour, is a battery of stone called the Tocohi Apostles, almost level with the water, and the guns of which carry each a ball of thirty-six pounds. A little higher, and opposite to the Point gate, is the Divino Poforo, or Shepherd's Battery, of fourteen guns, level with the sea. On the west side of the entrance to the harbour, is a square fort called the Punto, with four bastions well mounted with cannon, about two hundred yards distant from the Point gate of the town. On the bastions of the town, next the harbour, are a great number of cannon; and about the middle of the city is another fort, called El Fuerte, a square fort with four bastions, mounted with twenty-two pieces of cannon. Here the governor resides; and in it the king of Spain's treasures are deposited till the arrival of the galleons. But, though the fortifications are thus strong, they have many defects, and from the situation of the town and forts, are commanded by many eminences, of which a besieging enemy could not fail to take advantage. On the east side of the harbour, the Carabon, on a part of which the Moro is built, commands in a great measure that fort, as well as the Punta, El Fuerte, and the whole north-east part of the city, which is the best fortified. On the west side of the city runs a fault of country, called Guadalope, whose church is situated on an eminence about half a mile from the land-gate, with which it is on a level, and higher than any other place in the fortifications. From the north side of this rising ground, the Punta gate may be flanked; and from the south-east side the dock-yard is commanded. Along the north side runs an aqueduct, which, falling into the ditch at the land-gate, runs down to the dock-yard, both for watering the ships and turning a saw-mill. About half a mile from the church, is a bridge made over a rivulet that runs into the bay about one hundred yards. That road leads to the centre of the island, and extends to Baracoa, above six hundred miles distant. From this bridge to the Lazaretto, is about two miles, with a rising ground between them. A trench thrown up between these two points would completely sever the connection with the town by land. Hence it will plainly appear, that the Havannah, though well fortified, is not impregnable.

This settlement has greatly contributed to the maritime strength of the crown of Spain, many excellent ships having been built here, from sixty to eighty guns each; the island furnishing the finest materials, such as oak, pine, cedar, and mahogany. Upon the rupture of Spain in 1762, a British squadron and army was sent against this place, under the command of Admiral Cock and lord Albermarle. The Spaniards had then in the harbour a fleet of twelve fall of the line, two of them just launched, two more on the decks nearly finished, and a number of merchant ships. Most of the men of war were nearly ready for sea; but no account had reached the governor of the intended attack. The place, however, was gallantly defended, and sustained a siege of two months and eight days before it capitulated; when the noble ships, and public property to the amount of upwards of three millions sterling, fell to the lot of the enemy. Private property was less suffers, and the place was restored at the peace of Paris, in 1763.

The jurisdiction of the Havannah extends to half the island; the other half belongs to the capital, St. Jago. While the galleons lie here, a fair is held, in which great sums of money are exchanged, and every thing is excidedly dear; but at all times, the price of every necessity of life at the Havannah is extravagant, bread particularly; neither have they any great variety of fresh meat, nor is what they have of the best kinds, excepting their pork. This inconvenience is not owing to any defect in the soil of the island, but to the indolence of the Spaniards. During the war between Henry II. of France, and the emperor Charles V. it was taken, and burnt by the French; and in the year 1669, it was taken by the Buccaneers, under the command of captain Morgan. Lat. 23° 12' N- Ion. 81° 14' W. Greenwich. See the article CUBA, vol. v. p. 426.

HAVANT, a neat and pleasant town, situate on the south-easterly coast of Hospshire, on the turnpike-road between Portsmouth and Chichester, from each of which the town is thirty-six miles distant. Of the entrance of the town the west side consists of about five hundred houses; its air is particularly salubrious, as is evident from the many instances of longevity here met with. The church is an ancient fabric of Norman-Gothic architecture. Here are two annual fairs, viz. on June 22 and October 17. Market on Saturdays for all sorts of grain; and by an order
the corn returns are ordered to be delivered at this market instead of at Gosport. Nearly opposite Havant lie two romantic islands, the larger called Hayling, the other Thorny; each of which has its parish-church. The hills leading from Havant to Portsmouth afford a most unbounded view of the Solent, and of the Wight, for miles together.

On the north-east side of Havant is Rowland-castle, where two fairs are held annually: one on the 12th of May, referred to by the gentry many miles round; the other on the 14th of November, for corn and cattle. This place is beautifully situated; being bounded by woods on the north, south, and west, and by a rich and extensive lawn (about one hundred yards broad and two miles in length) leading to the magnificent seat called Stanstead, in Suffex, formerly belonging to lord Halifax; and since to Richard Barwell, esq. It is four miles from Havant, and five from Chichester.

HAVASH, or HAWASH, a river of Africa; which rives in Abydinia, and runs into the Arabian sea. Lat. 19. N. lon. 44. 55. E. Greenwich.

HAUBAN, a mountain of Arabia Felix; twelve miles east of Taas.

HAUBERK, /.' A hauberk. Obj.ote.

HAUBERGETS, /.' A coat of mail; a breast-plate:

Haubers and helms are haw'd with many a wound; The mighty mazes with such hafe defend, They break the bones, and make the armour bend. Dryd.

HAUBO, a town of Sweden, in the province of West Gothland: seven miles north-north-west of Gotheborg.

HAUBOURDIN, a town of France, in the department of the North, and chief place of a canton, in the district of Lille: one league south-west of Lille, and four and a half north-east of Bethune.

HAUDB, a town of Arabia Felix, in the province of Yemen: fifty-six miles south of Saide.

To HAVE, v. a. in the present I have, thou haft, he hath: we, ye, they, have; pret. and part. past. had; [haben, Gotic; habban, Sax. habben, Dut. hebben, Fr. avoir, Ital. avere.]

Not to be without.—I have brought him before you, the nation had, I must have something to write. Acts xxv. 26. —To carry; to wear.—Upon the mast they saw a young man, who sat as on horseback, having nothing upon him. Sidney. —To make use of.—I have no Levite to my priest. Judges. —To possess.—He that gathered much had nothing over, and he that gathered little had no lack. Exod. xvi. 15. —To obtain; to ensnare.—Now, O Father, glorify me with thine own self, with the glory which I had with thee before the world was. John xvii. 5. —To receive.—A secret happiness in Petronius is called curios con felicitas, and which I suppute he had from the feliciter audere of Horace. Dryd. —To be in any state; to be attended with or united to as accident or concomitant.—Have I need of madness, that ye have brought this fellow? Acts xxvi. 15. —To put; to take.—That done, go and cart it, and have it away. Tuffier. —To procure; to find.—I would have any one name to me that tongue, that one can speak as he should do, by the rules of grammar. Lech. —Not to neglect; not to omit: Your plea is good; but still I lay beware: Laws are explained by men, to have a care. Pope.

To hold; to regard.—Of the maid-servants shall I be had in honour. 2 Sam. —The proud have had me greatly in derision. Psalms. —To maintain; to hold opinion.—Sometimes they will have them to be natural heat, whereas some of them are crude and cold; and sometimes they will have them to be the qualities of tangible parts, whereas they are things by themselves. Bacon. —Con-

VOL. IX. No. 582.

tain.—I will never trust a man again for keeping his word clean; nor believe he can have every thing in him by wearing his apparel neatly. Shakespeare. —To require; to claim:

What would these madmen have ?

First they would brieve us without penes,

Deceive us without common fene,

And without powe'r enlafe.

Dryd.

To be a husband or wife to another.—If I had been married to him, for all he was in woman's apparel, I would not have had him. Shake-peare.—To be engaged, as in a talk or employment.—Kings have to deal with their neighbours, their wives, their children, their prelates or clergy, their nobles, their merchants, and their commons. Bacon. —To wish; to desire; in a lax fene.—I had rather be a door-keeper in the house of my God, than to dwell in the tents of wickedness. Psalms. —To buy.—If these trifes were rated only by art and artfully, we should have them much cheaper. —It is most used in English, as in other European languages, as an auxiliary verb to make the tenses; have, has, and had, the preterperfect; and had, and had, the preterperfect.—If there had been a word between them to have expressed to keep, they had gone together by the ears. Congre. —The gods have placed labour before virtue. Addison. —That excellent author has shewn how every particular custom and habit of virtue will, in its own nature, produce the heaven, or a state of happines, in him who shall hereafter practise it. Addison.

Have, at, or with, is an expression denoting resolution to make some attempt. They seem to be imperative expressions: have this at you; let this reach you, or take this; have with you; take this with you; but this will not explain have at, or have at him, which must be considered as merely elliptical; as, we will have a trial at it, or at him. —He that will caper with me for a thousand marks, will let him lend me the money, and have at him. Shake-peare.

Have, a sign of the paff tense neuter. Have now; have indeed.

TO HAVE, v. n. To behave. Obf.ote.

TO HAVE AFTER, v. n. To make pursit. —Have after. Herriet.

HAVE (Le), a small island, near the south-east coast of Nova Scotia. Lat. 44. 15. N. lon. 64. 50. W. Green-\n
HAYEL, a river of Germany, which issues from a lake, in the duchy of Mecklenburg, and runs into the Elbe, near Werben, in the Old Mark of Brandenburg.

HAYELBERG, a town of Germany, in Upper Saxony, and mark of Pregnitz, situated on the Havel, which surrounds and forms it into an island. It was formerly the seat of a bishop, founded in the year 968, by the emperor Otho I. but the bishop, Joachim Frederic, succeeding to the electorate in 1598, no other bishop has been since appointed, but the chapter Hill continues.

HAY-ES, [have, Dut. have, Fr.] A port; a harbour; a station for ships. —See Harbours.

HAVEN, f. [have, Dut. haven, Fr.] A port; a harbour; a station for ships. —See Harbour.

We entered into a good haven, being the port of a fair city. Bacon.

Love, favour'd once with that sweet gale, Doubles his hate, and fills his fail, Till he arrive where I shall prove, The haven, or the rock of love. Waller.

A shelter; an asylum:

All places, that the eye of heaven visits,

Are to a wife man ports and happy havens. Shake-peare.
and dukes appointed their special officers, as receiver, havener, and cifomier. Carœs.

HAUSSTEIN, a town of Germany, in Swabia, capital of the county to which it gives name, in the Austrian Brabant; the county contains rich mines of iron ore, divided into eight communities; the town is situated near the Rhine; the towe, first, by title, three miles east of Lauenburg, and thirteen north-west of Baden.

HAVER, f. [from haver.] Possessor; holder: Valour is the chiefest virtue, and Most dignifies the haver. Shakespeare.

HAVER, a common word in the northern counties for oats, & a haver breed for oat breed; perhaps from avena, Lat. or harver, Germ. —When you would anneal, take a blue-flone, such as they make haver or oat cakes upon, and lay it upon the cors bars of iron, Peckham.

HAVER, in botany. See Avena.

HAVERCAM (Siegbert), a Dutch critic and philosopher, born in 1683. He was made professor of history, the Greek language, and rhetoric, at Leyden, where he died in 1742, at the age of fifty-nine. His learning and industry were displayed in the following works: 1. S. F. Tertulliani Apologiae, Lugd. Bat. 1718, 8vo. 2. Dissertatio de Nummata Alexandri Magni, qua qua tormenta Romana Terrae imperii continuatur, & de Nummis conscriptis, Apoll. 1723, 4to. 3. Acta et Praelectiones de Nummatico de Parisia, cum Commentario, 1733, 3 vols. folio. 4. T. Lucretii Carini de Rerum Natura, cum Notis Variorum, Amf. 1725, 2 vols. 4to. 5. Josephi Opera omnia Graeca & Latina, 1726, 2 vols. folio. 6. Etymologiae Historiae Romanae, 1729, 8vo. 7. Theaumus Mortiianus, sive Familiarum Romanorum Numismata omnia, Angled. 1734, 2 vols. large folio.

HAV'ERHULL, a post-town of the American States, in New Hampshire, and the capital of Grafton county, situated on the east side of Connecticut river, in Lower Canada. It has a weekly market, a custom-house, and a congreational church. This township was incorporated in 1763, and then contained 532 inhabitants. In it is a bed of iron ore, which has yielded some profit to the proprietor, also a quarry of free-stone of an excellent quality. It has also a fulling-mill, an oil-mill, and many other excellent mill-farts. It is opposite to Newbury in Vermont, thirty-five miles above Dartmouth-college, 119 miles north-west of Portsmouth.

HAV'ERHILL, a handsome post-town of the American States, in Essex county, Massachusetts, situated on the east side of Merrimack river, across which is an elegant bridge, connecting this town with Bradford, 660 feet long, and 54 wide. It has three arches, of 150 feet each, supported by three hand-fome stone piers, forty feet square; with a draw of thirty feet, over the channel of the river, in the centre of the bridge. Haverhill has a considerable inland trade, lying about thirty-two miles north-by-west of Boîlon, and twelve from Newburyport, at the mouth of the river, and about twenty-eight miles west of Portsmouth in New Hampshire. It has twenty-five excellent mills situated on the Merrimack, and has a considerable inland trade, lying about thirty-two miles north-by-west of Boîlon, and twelve from Newburyport, at the mouth of the river, and about twenty-eight miles west of Portsmouth in New Hampshire. It has twenty-five excellent mills situated on the Merrimack, and is a place of considerable importance. It has a weekly market, a weekly market, and a fair on the fifth of May, and another on the first of August, and many other excellent mill-farts. It is opposite to Newbury in Vermont, thirty-five miles above Dartmouth-college, 119 miles north-west of Portsmouth.

HAV'ERHILL, a small island of Scotland, near the west coast of the island of Skye. Lat. 57. 22. N. long. 5. 17. W. Edinburgh.

HAV'ERSTRAW, a township of the American States, in Orange county, New York, situated on the west side of a bay of the same name, thirty-five miles north of New York, and contains 4326 inhabitants, of whom ninety-eight are electors.

HAV'ERSTRAW BAY, a bay of the American States,
States, called by some Havervahm, in Havens's river, thirty-eight miles above New-York city, spreads south of Stony Point, and before the town of its own name is ten miles long and about three wide.

HÁVÉRY, two small islands of Scotland, near the west coast of Shetland. Lat. 59. 59. N. Ion. 1. 33. E. Edinburgh.

HAUGH, s. A little meadow lying in a valley. Camden.

HAUGH'I, adj. [haut, Fr.] Haughty; insolent; proud; contemptuous; arrogant. Obsolete.

The proud infulting queen,
With Clifford and the haughty Northumberland,
Have wrought the easy-melting king, like wax. Shakes.

High; proudly magnanimous:

His courage haughty,
Daunt'd of foreign foemen to be known,
And far abroad for strange adventures fought. Spenser.

HAUGHTILY, adv. Proudly; arrogantly; contemptuously:

Her heav'nly form too haughtily the priv'ld,
His perfon hated, and his gifts despis'd. Dryden.

HAUGHTINESS, s. Pride; arrogance; the quality of being haughty.—By the head we make known our supplications, our threatenings, our mildneff, our haughtiness, our love, and our hatred. Dryden.

HAUGHTY, adj. [hauteur, Fr.] Proud; lofty; insolent; arrogant; contemptuous:

I shall fell of tongues, battle, and rage,
And haughty souls, that, mov'd with mutual hate,
In fighting fields purf'd and found their fate. Dryden.

Proudly great:

Our vanquish'd wills that pleading force obey;
And haughty Britannia yields to arbitrary sway. Prior.

Bold; adventurous; of high hazard. Obsolete.

Who now shall give me words and found
Britain yields to arbitrary sway.

HAUGSTORFF, a town of Germany, in the arch-duchy of Auffria: five miles eaf of Roz.

HAVILAH (Land of), mentioned by Moses, Gen. ii. 11. Probably the fame with that mentioned Gen. xxvii. 18.

HAVILAH, a city and district of Arabia, bordering on the Perian gulf, belonging to the grand vizir. It is under the government of a defendant from Mahomet, who has the privilege of minting money.

HAVIXBEEK, a town of Germany, in Weiphalia, and bishopric of Minden: fix miles south-eaft of Hoftmar.

HAUK'AL (Abu Cafim Ebn), a celebrated Mohamnedan geographer, who, about the middle of the tenth century, travelled through Arabia, Egypt, and Samar- cand, and published an account of his travels in the Arabic language. "My design," says Ebn Haukal, "in the composition of this book, is to describe the various climates and regions of the face of the earth, comprised within the circle of Islam, or Mohemmedanism; but, as the particular details seemed unnecessarily prolix, they are here compreffed within a small compass; and in the present volume, (which is entitled Myfeles, or Memalik,) our plan is to difcribe, and to delineate on paper, the various feas of oceans which form the land, the inhabited and the defert islands, and every cli- mate or region of the earth; affixing the name of each, so that it may be known in the maps; and confining our- selves to those countries which are the seat of Islam, and the residencc of true believers." In these countries the following ancient curiosities are stated:

In the territory of Itakkar is a great building, with statues carved in stone; and there, also, are inscriptions, and paintings. It is said that this was a temple of Solomon, to whom be peace! and that it was built by the Dives, or Demons: similar edifices are in Syria, and Baalbek, and Egypt. The ruins here meant are the temple of Min, or forty pillars, supposed to contain the only remnants of the city of Persepolis, destroyed by Alexander.

In the territory of Itakkar, also, is a kind of apple, half of which is sweet, and half four. Mirdas ben Ontru mentioned this circumstance to Hafan Reja: he denied the possibility of it; and Mirdas fent and caufed one to be brought, and he difcover'd it. At the village of Abderrahma, there is a great pit, the bottom of which is dry all the year, except at the feafor for watering the fields, when water in fues from it, and serves for the purpofe of agriculture and drinking. When it is not any longer neceffary for the husbandman's life, the water disappears. This fuplerphenomenon is not entirely without example: as we read of a pool in Guine, near the church of St. Jean d'Angeli, which is almoft deftitute of water in winter, though in summer it yields it abundantly. A fimilar fountain is faid to exift in Spain, about twelve miles from Valladolid, which begins to flow in May, and ceases in November.

In the territory of Shapar, there is a mountain, and in that mountain are the statues of all the kings, and generals, and high prifons, and ilhufious men, who have exifted in Pers. And in that place are numenous perfons who have repreffentations of them, and the flowers of them written; and this territory belongs to the tribe of Arg- han, fub Hifi Mohdi. This probably relates to the ruins at Nakli Kullum, which have been usually men- tioned as fepulchres.

At the city of Jaur, near the northern gate, is a pond, or pool of water, in which a brazen vulture is placed, that, from a hole in it, the water influes with great violence. In the vicinifity of Abercuh are conliderable heaps of alhes. The common people fay, that here was the fire of Nimrod (into which he caufed Abraham to be thrown). But this is not true: the fact is, that Nimrod, and the kings of Canaan, dwelt in the land of Babylon. In the Curia of Argan, called Ragian on our maps, at the village called Sahil al Arab, there is a well, from which proceeds water enough to turn a mill, and water the fields. The people here fay, that they have made various efforts to ascertain the depth of this well, but have not ever been able to reach the bottom. In the Curia of Roffac al Roffac there is a place between two hills, from which fmoke constantly influes; and it is faid, that if a bird should fly near that place, it would drop dead before.

At Sinir, Genab, Cazarun, and Tuj, linen garments are manufactured; and the embroidery and clothes made at Basra are esteemed by the princes in all countries, and fent into all parts of the world. The gold brocade worn by the princes is made at Basra. This embroidery is per-
formed with a needle; and here they also weave cloth of gold, and fine garments, and hangings, of silk and camel's hair. At Yezda and Ahercub, they manufacture clothes of silk and cotton; at Gehren, fine carpets. At Aby, which is a town of the Desert Varin, they make beautiful tapestry and carpets. Basa is remarkable for needle-work; and they excel there, in respect to that art, the people of Corcub. The striped stuff of Shiraz are well known; and in the Cura of Iftakhar they manufacture fine linen.—This interesting and curious work of Ibn Haukal has been translated by Sir William Ouseley, and published in quarto, in 1830.

HAUKEDAL, a town of Norway, in the diocese of Bergen; seventy miles north of Bergen.

To HAUL, v. a. [halar, Fr. to draw.] To pull; to draw; to drag by violence. A word which, applied to things, implies violence; and, to persons, awkwardness or rudeness. This word is exemplified in hale, etymology is regarded in hale, and pronunciation in haul.

HAUL'D, a town of Norway, in the diocese of Bergen; seventy miles north of Bergen.

Thither they bent, and hau'd their ships to land;

HAU'KEDAL, a town of Norway, in the diocese of Bergen: seventy miles north of Bergen.

To HAUL, v. a. [halar, Fr. to draw.] To pull; to draw; to drag by violence. A word which, applied to things, implies violence; and, to persons, awkwardness or rudeness. This word is exemplified in hale, etymology is regarded in hale, and pronunciation in haul.

Their cottage divides the yellow sand.

HAU'KEDAL, a town of Norway, in the diocese of Bergen: seventy miles north of Bergen.

Their cottage divides the yellow sand.

Thither they bent, and hau’d their ships to land; The crooked keel divides the yellow sand. Pope.

Thither they bent, and hau’d their ships to land; The crooked keel divides the yellow sand. Pope.

Thither they bent, and hau’d their ships to land; The crooked keel divides the yellow sand. Pope.

HAU'MANSGRUN, a town of Germany, in Upper Saxony; chief place of a canton in the department of the Tarn, and seat of a tribunal, in the department of the Lower Seine, situated in a flat marshy soil, intersected with creeks and ditches, at the mouth of the Seine. In 1509 it contained only a few houses inhabited by fishermen. Francis I. erected it into a town, and called it Ville de Franeker, which was afterward changed to the name it now bears, on account of a chapel, and the harbour formed by the mouth of a river. The harbour has particular advantages above all others on that coast; the water does not begin to ebb till three hours after the full tide, which gives an opportunity for a great number of ships to depart in the same tide. The cause of this is attributed to the current of the Seine, which crosses the mouth of the harbour as soon as the sea begins to retire, and thus confines the water in the harbour till it has spent its strength. The bafoin is reserved for ships of war, with sufficient room for thirty, and depth of water for vessels of sixty guns. Before the revolution, it was the seat of a governor-general, and other officers; a barracks, a citadel with bastions, &c. During the civil wars it was the seat of a governor-general, and other officers; a citadel, admiralty, &c. It contained two churches, three convents, an hospital, town-house, an arsenal, magazine, and store-houses, necessary for the construction and arming of ships. It is defended by lofty walls, large ditches filled with water, and furnished with breaches; a regular citadel with baillie, &c. During the civil wars on account of religion in France, the French Huguenots fled from this town, and put it into the hands of the English; but in 1623, the Protestants concluding a peace, the English garrison was obliged to surrender the town,
on capitulation. In 1604, this town was bombarded by the English fleet, under the command of rear-admiral Rodney, who set fire to the town several times, and destroyed a great number of flat-bottomed boats, that were intended to bring troops over to England. It is ten pofts and a half weft of Rouen, and twenty-seven north-west of Paris.

HAUVE, a bay on the north coast of the island of Jersey: five miles north of St. Helier.

HAUVE-GERSE, a post-town and port of entry of the American States, in Hartford county, Mary-land, on the west side of Susquehannah river, at its mouth in Chesapeake Bay. It is the port of entry for all the flores of Chesapeake Bay above Turkey Point: six miles west-by-south of Charlestown in Cecil county, thirty-seven north-east of Baltimore, and sixty-five west-by-south of Philadelphia. Lat. 39° 39'.

HAUVE-MER, a town of Germany, in the archduchy of Austria: five miles north-west of Mulhau.

HAUVE, a town of Germany, in the archduchy of Austria: six miles north-west of Steyregg.

HAUSAY, a small island of Scotland, one of the Out Skerries: sixteen miles east of Shetland.

HAUSE, f. A sea term; the haue, the space between the stern of the ship when it is moored with two anchors.

HAUSE-HOLES, f. In a ship, the holes cut through the bows of a ship on each side of the stern.

HAUSE-LINES, f. Breaches; flops. An old word.

HAUSE-PICES, f. A sea term; the foremost tim-ber of a ship.

HAUSEBERGE, a town of Germany, in Weftphalia; and county of Minden: three miles south of Minden.

HAUSEGG, a town of Germany, in the archduchy of Austria: seven miles north-east of Bavarian Waid-haven.

HAUSEN, a lordship of Germany, in Swabia, belonging to the prince of Fürstenberg, in the Schwartzwald.

HAUSEN, a town of Germany, in Swabia, and capital of the lordship to which it gives name, on the Kinzing: twenty miles north-east of Rothweil, and twenty-five south-east of Straubing.

HAUSIBLE, adj. [hauruc, Lat. to draw.] Capable of being emptied. Col.

HAUSIEU, a town of Germany, in the archduchy of Austria: seven miles south of Soummen.

HAUSEN, a town of Germany, on the Lower Rhine, and electorate of Mentz, near Salminfter, and three miles north of Orbe.

HAUST, or HAUSTUS, f. A draught; as much as a man can well swallow at once; a dry cough. Col.

HAUSTOTEN, a town of Germany, in the archduchy of Austria: two miles south-east of Graz.

HAUT, an island of the American States, the south-easternmost of the large islands of Penobscot-bay, in Lincoln county, district of Maine.

HAUT-CONTRE, f. [French.] In mufe, counter-tor.

HAUT-DESSUS, f. [French.] First treble.

HAUTBOY, f. [haut and bois, Fr.] A wind instrument of mufe.—Now give the hautboy breath; he comes, he conies. Dryden.

HAUTCOMBE, a town of Savoy, on the west side of the lake Bourget: twelve miles north-east of Chambery, and seventeen south of Belley.

HAUTFUIVRE (John), a French ecclefiaftic, born at Orleans in 1647. He was the fon of a baker in that city; but having by the brightness of his parts recommended himself to the notice of the duchefs de Bouillon, that lady bestowed on him a liberal education. After he had gone through the preparatory studies, he embraced the ecclefiaftical life, and through the interefl of his patroness was prefted to several benefices. He had also the honour of accompanying her in her travels through Italy, England, and other countries, which afforded him an extensive field for observation and improvement. He had a particular taste for clock-work, in which art he made several discoveries that were of singular ufe. He was the firft who invented the method of moderating the vibration of the balance in watches by means of a steel fpring. This discovery he communicated to the Royal Academy of Sciences in Paris, in 1674; and the watches into which it is introduced are called, by way of eminence, pendulum-watches; because they nearly approach to the finelness of pendulums. This invention was perfected by M. Huygens; but as that mathematician claimed the merit of the original discovery, and had obtained from Louis XIV. a patent for the conftuction of watches with spiral springs, the abbe Hauteville opposed the registering of that privilege, and published his objections against M. Huygens in 1675. He afterwards published a variety of other treatifes, moft of which abound in ufeful obfervations, and ingenious hints. He died at at Orleans in 1700, aged seventy-four years. He was the author of, 1. The Perpetual Pendulum, 1678, 4to. 2. New Inventions, 1717, 4to. 3. The Art of Breathing under Water, and the Means of preferring a flame confined within a small Space, 1681, 4to. 4. Reflections on certain Machines for raising Water, 1682. 5. A New Method of finding the King on the Longitude, 1709, folio. 6. A Letter on the Secret of the Longitudes, 1719. 7. A New Syfte-m of the Flux and Reflux of the Sea, 1719. 8. A New System of the Time of the Earth, 1720.

HAUFTFORT, a town of France, in the depart-ment of the Dordogne, and chief place of a canton, in the district of Excideuil: two leagues south-east of Excideuil, and fix north-east of Perigueux.

HAUTELUC, a town of the duchy of Savoy: thirteen miles north-east of Confians.

HAUTEFIVE, a town of France, in the department of the Drome, and chief place of a canton, in the district of Drome: one league north of Romans, and five north-east of Montbrison.

HAUTEVILLE, a town of France, in the depart-ment of the Aine, and chief place of a canton, in the district of Belley: two leagues south of St. Kambert.

HAUTEVILLE, a town of France, in the departe-ment of the Marne, and chief place of a canton, in the district of Itirey-le-François: three leagues south-east of Itirey.

HAUTEVILLE-la-GUICHARD, a town of France, in the department of the Channel: seven miles north-east of Coutances.

HAUTGOUR, a town of Hindooftan, in the circle of Ciaccole: twenty-two miles north-west of Ganjam.

HAUTGOUT, f. [French.] Any thing with a strong fcent.—They made ufe of both the leaves, stalk, and extract, espe-cially of filphium, as we now do garlic, and other hautgouts, as naufeous altogether. Evelyn.

HAUTPOUL, a town of France, in the department of the Tarn: five leagues north of Carcassonne, and three and a half south-east of Carcassonne.

HAUT THORAUME, a town of France, in the department of the Lower Alps, and chief place of a canton, in the district of Epernay: one league north of Epernay.

HAUTZENHEIM, a town of Germany, in the coun-ty of those fields.
HAUT'ZENTHAL, a town of Germany, in the archduchy of Austria: six miles south of Sonnenberg.

HAUZ HOK'MOZ, a town of Persia, in the province of Kerman: thirty leagues south of Sirjan.

HAUZBERG, a town of Germany, in Bavaria, and bishopric of Passau: six miles north-east of Passau.

HAW, f. [hag, Sax.] The berry and seed of the hawthorn.—Store of hawes and hips portend cold winters. Because.—An excrefence in the eye. —[Paga, Sax. hawa, Dan. a garden.] A small piece of ground adjoining to a house; as hemp-haw, or bean-haw, andinclined for such like cultivation. But sir Edward Coke, in an ancient plea concerning Feverham in Kent, says hawes are houfes. Co. Lit. 5.

To HAW, v. n. [perhaps corrupted from hawk, or hatch.] To speak slowly with frequent interruption and hesitation.—'Tis a great way; but yet, after a little humming and having upon't, he agreed to undertake the job. L'Estrange.

HAW-FINCH. See the article Loxia.

HAWES, a river of Wales, which runs into the Severn, two miles below Newtown, in the county of Montgomery.

HAWK, a town of Scotland, in the county of Roxburgh, on the river Tiviot: thirty-two miles south-west of Berwick, and thirty-three south-south-east of Edinburgh.

HAWING, v. f. A flowness of speech; a speech made with frequent hesitations.

HAWK, f. [hawker, Welth; hauco, Sax. accipiter, Lat.] A bird of prey, anciently used to catch other birds. For the natural history and numerous species, see the article Falco, vol. vii. p. 183.

Hawk, v. n. To fly hawks at fowls; to catch with hawks feek their game where they can find it.

Hawk, n. [hoge, Welfh; hapoc, Sax. Accipiter, Lat.] A fal'cner Henry is, when Emma hawks;

To fly at; to attack on the wing:

Whether upward to the moon they go,
Or dream the winter out in caves below,
Or hawk at flies elsewhere, concerns us not to know.

Prior.

Dryden.

Hawk, v. n. To force up phlegm with a noise—Come, a song, without hauk'ning or fittine, or faying we are hoarse, which are only the prologues to a bad voice. Shakespeare.—To fell by proclaiming them in the streets.

From hocke, Germ. a fal'man's pack.

His works were hawked in every street,
But seldom rofe above a little.

Swift.

Hawke (Edward), a gallant English admiral, the son of Edward Hawke, esq. barrister at law. He was educated for the navy, and passed through the subordinations, till in 1734 he became a post-captain. He first distinguished himself in 1744, in the incomplete engagement between our admirals Matthews and Leflock, and the combined fleets of France and Spain, off Toulon. On that occasion a Spanish ship of the line (the only enemy's vessel which yielded) struck him; and he broke the line-of-battle to succour two English ships, for which act he incurred the fullpenion of his commission, but it was most honourably restored to him. He was made a rear-admiral of the white in 1749; and in October of that year, having been sent with a squadron of fourteen ships of the line to intercept a French West-India fleet, he fell in with it under a convoy of nine ships of the line, out of which, after an obstinate action, he captured seven. His successes were rewarded with the knighthood of the Bath, and promotion to the vice-admiralty of the navy. On the renewal of the war in 1755, after the failure of admiral Byng in the Mediterranean, Sir Edward Hawke was sent thither with a powerful fleet, but arrived too late to save Minorca. He, however, blocked up the enemy's fleet in Toulon, and restored the English superiority in that sea. In 1759, for Edward during the whole summer blockaded the harbour of Brest, where the French fleet under admiral Conflan, with a large equipage of transports intended for the invasion of England. In the beginning of November a storm drove him into Torbay, and in the mean time the French fleet got out. Hawke immediately steered to the coast of Brittany, and on November 20th came in fight of the enemy. The weather was tempestuous, the coast full of rocks and shoals, and Conflan's fleet as near as possible on the lee-shore. The English admiral, however, resolved to pursue, and, notwithstanding the danger of running aground, ordered the helmsman to lay him close to Conflan's ship. A bloody engagement ensued, in which the approach of night alone faved the French from total destruction. The result was, that the French admiral-ship and another were burnt, two were sunk, and one taken, all of the line; and seven more were obliged to take shelter in the mouth of a shallow river. The meditated invasion was thus entirely defeated, and the French navy received a blow from which it never recovered during the remainder of the war. The pay and salary of the English admiral was doubled with a pension, and parliamentary thanks. He was raised to the high office of vice-admiral of Great Britain in 1765, and in 1770 was placed at the head of the admiralty. In 1776 he was created a peer of the realm by the style of baron Hawke of Towton in Yorkshire; and thus deservedly ennobled, he died in 1781.

Hawke, a township of the American States, in Rockingham county, New Hampshire, distant twenty-seven miles from Portsmouth, was incorporated in 1766, and contained, in 1770, 420 inhabitants.

Hawke's Bay, a bay on the east coast of Labrador. Lat. 53. 10. N. lon. 55. 30. W. Greenwich.

Hawke's Bay, a bay on the east coast of the northernmost island of New Zealand, in the South Pacific Ocean.

Hawke's Bay, a bay on the coast of West Florida, westward of the mouth of Mobile-bay, between Pelican and Dauphin islands. There is a broad channel of eleven and twelve feet water, afterwards safe anchorage in four fathoms, good holding ground, and sheltered from middle winds; on which account it is very convenient for small vessels.

Hawke's Harbour, a harbour formed by an arm of Igonrachio Bay, Newfoundland Island.

Hawke's Island, a small island near the east coast of Labrador. Lat. 53. 10. N. lon. 55. 30. W. Greenwich.

Hawked, adj. Formed like a hawk's bill.—Flat noses seem comely unto the Moor, an aquiline or hawked one unto the Persian, a large and prominent nose unto the Roman. Brown.

Hawker, f. [from hocke, Germ.] One who sells his wares by proclaiming them in the streets; a pedlar:

To grace this honour'd day, the queen proclaims,
By herald hawkers, high heroic games;
She summons all her sons; an endless band
Pours forth, and leaves unpeopled half the land. Pope.

Hawkers were originally deceitful fellows, who went from place to place buying and selling brats, pewter, and other goods and merchandise, which ought to be utterly in open market; and the appellation seems to grow from their uncertain wandering, like perfons that from place to place buying and selling brats, pewter, and other goods and merchandise, which ought to be utterly in open market; and the appellation seems to grow from their uncertain wandering, like perfons that

They are mentioned in flat. 33 Hen. VIII. 8. c. 4. Hence came
came Hawkers, Pedlars, and Petty Chapman, who travel from place to place with goods and merchandise, and are under the control of commissioners who are to licence them for that purpose by direction of Stats. 8 and 9 Will. III. c. 25. 29 Geo. III. c. 26. Traders in the linen and woollen manufactures, lending their goods to hawkers and pedlars, and selling them by wholesale; makers of goods, selling those of their own making; and makers and sellers of English bone-lace, going from house to house, &c. are excepted out of the acts, and are not to be taken as hawkers. Stats 3 and 4 Ann. c. 4. 4 Geo. I. c. 6. 29 Geo. III. c. 26. Hawkers of newspapers, pamphlets, &c. are expressly excepted from the penalties and regulations applied to other hawkers. The Stat. 29 Geo. III. c. 26, directs that hawkers, pedlars, &c. shall pay a duty of four pounds a-year for a licence for themselves, and four pounds more for every beast employed by them. Before obtaining this licence each of them is to produce a certificate, signed by a clergyman, and two respectable inhabitants in his place of residence, of his good behaviour. Selling one parcel of silk handkerchiefs, shall not make a man a hawkor or pedlar. Burr. 609. The said Stat. 29 Geo. III. c. 26, also provides, that such hawkers shall not sell their things by auction; that the words licensed hawker shall be marked on all packs, boxes, and parcels, and that hawkers, failing to mark their packs, &c. hawkers selling smuggled goods shall forfeit their licence, and be incapable of having another granted them. The Stat. 7 Geo. III. c. 43, prohibiting hawkers to carry foreign cambric or lawn is repealed by Stat. 27 Geo. III. c. 6.

Trading as a hawker without a licence, or refusing to show it, incurs a penalty of twelve pounds, half to the informer, and half to the poor; or on non-payment to suffer as a vagrant. Stats 9 and 10 Will. III. c. 27. 3 and 4 Ann. c. 4. Under Stat. 29 Geo. III. c. 26, the penalty is ten pounds, half to the king and half to the informer. Hawkers refusing to produce their licences, or lending or borrowing licences, to forfeit ten pounds. And they may be detained till they produce their licences. Stat. 29 Geo. III. c. 25. Counterfeiting licences, fifty pounds. Stat. 9 and 10 Will. III. c. 27. Now one hundred pounds. Stat. 25 Geo. III. c. 78. If hawkers and pedlars, hawkers, or pedlars, should create forgeries to sell, though they have permits, the same may be seized as forfeited. Stat. 9 Geo. II. c. 35.

Every contable, &c. refusing to affist in the execution of this act, shall, on conviction by the oath of one or more credible witnesses or witnesses before a justice of the peace, forfeit ten pounds for each offence. The clauses reducting hawkers from selling in market-towns, except on a fair or market-day, is repealed by Stat. 35 Geo. III. c. 91.

Hawkers, &c. who were licensed on or since May 1, 1759, may set up, occupy, use, or exercise, any craft, mystery, or occupation, in the place where they are resident inhabitants, though not brought up thereto by apprenticeship, and may employ therein persons who have been apprentices, notwithstanding the act of 5 Eliz. and, if they shall be prosecuted, may plead the general issue.

Nothing in this act shall extend to prohibit any persons from selling any printed papers, licensed by authority, or any fish, fruits, or victuals, nor to hind any persons who are the real workers or makers of any goods, wares, or manufactures, of Great Britain, or his, her, or their, children, apprentices, agents, or servants, from carrying abroad, exposing to sale, and selling by retail or otherwise, any of the said goods, wares, or manufactures, in any mart, market, or fair, and in every city, borough, town-corporate, and market-town; nor any tinkers, cobblers, glaziers, plumbers, harness-makers, or other persons usually trading in mending kettles, tubs, household goods, or harnesses whatsoever, from going about and carrying with him or them proper materials for mending the same. No wholesale dealer in British goods, selling by wholesale only from house to house, to be deemed a hawker.

HAWKESBURY, a river of New Holland, so named by governor Phillip, which is from three hundred to eight hundred feet wide, and detersquies into Broken Bay, near Port Jackson, in New South Wales. It is found navigable for the largest merchant ships as far as a lofty eminence called Richmond Hill, which is called the head of the river, where it divides into two branches, each of which becomes shallow and narrow, losing them-
by the canals; and, from the finenes and lightnefs of its quality, it is in many places conveyed a great way by land-carriage. Lately, it has begun to be shipped for the West Indies.

Here is a very good free grammar-school, founded in 1585, by Edward Sandys archbishop of York, a native of this place. It consists at present of above one hundred boys, and is defervedly in distinguished repute amongst the schools in the north, under the auspices of three classical teachers. The market is held on Mondays; and the fairs established by charter from James I. are on Easter Monday, the Monday next before Ascension day, Whit-Monday, and the ad of October. The tolls, granted to the town to be taken at these fairs, have for their encouragement been a long time discontinued. Hawkefhead is distant from Kendal by the ferry at Windermere (where carriages of all kinds are taken over with the greatest convenience and dispatch) thirteen miles south; from Lancaster, by Carmel, over land, thirty miles fourth; from Ulverston, fifteen miles south-west; from Penrith twenty-nine miles north-east; and from London 573 miles north.

HAWKESWORTH (John), an ingenious writer, born in 1715, or, according to others, in 1719. His parents were dissenters in humble life. By great industry and application he fitted himself for the profession of a man of letters; and in 1742, he became Dr. Johnson's fencing officer in the office of compiler of the parliamentary debates for the Gentleman's Magazine. In 1752, he began to publish a set of periodical papers under the title of The Adventurer, which were continued to the one hundred and fortieth number, and then collected into four volumes 12mo. Of these, one half, or seventy numbers, were of his own composition. He had for his coadjutors Johnson, Bathurst, and Warton, and there were a few other occasional contributors. The Adventurer was favourably received by the public, and merited its success by the purity of its morals, the elegance of its critical disquisitions, and the acquaintance it displayed with life and manners. Archbishop Herring, to whom Hawkefworth had approved the moral and religious tenor of these papers, that he conferred upon Hawkefworth the degree of doctor of civil law. This acquisition of dignity, however, left Dr. Hawkefworth the friendship of Johnson, (who had not then obtained a similar honour,) and they appear never again to have associated together. That Hawkefworth was elevated by this new title to a degree of doctor of civil law. This acquisition of dignity, however, left Dr. Hawkefworth the friendship of Johnson, (who had not then obtained a similar honour,) and they appear never again to have associated together. That Hawkefworth was elevated by this new title to an eminence in the literary world, is evident from the numerous panegyrics which were written about him in the newspapers; and his works were for a short time, after his death, under the censorship of some of the critical journals. But as the reputation he had thus acquired as a writer, obtained for him, in 1737, the distinguished task of compiling into one narrative an account of all the voyages of discovery made by command of his majesty George III. up to that period of his reign. This work was published in three volumes quarto, magnificently adorned with charts, maps, &c. and comprising the journals kept by commodore Byron, captains Walfall and Carteret, and lieutenant Cook, in their respective voyages to the Southern hemisphere and Pacific ocean. Dr. Hawkefworth received the munificent reward of six thousand pounds, and his execution of the task obtained the praise of lively and elegant narration, and of fidelity as to matters of fact; which, indeed, from such materials, he could not have miffed. The honour and fame he had acquired were enjoyed by him but a very short time; for the year in which this work appeared was the year of his life, which closed on November 16, 1773, at Bromley. He was a man of irritable passions and exquisitely sensibility, but friendly, social, and humane. His conversation is represented as having been highly agreeable, and his manners to have been those of the scholar and the gentleman.

HAWKING, J. The art of sport of taking wild-fowl or game by means of hawks. The method of reclaiming, manning, and training a hawk to this exercise, is called falcore; for which see the article FALCONRY, vol. vii. p. 197, and the correspondent Engraving. — The effort to bring up phlegm from the throat. The practice of offering goods to trade from place to place.

He was a man of irritable passions and exquisitely sensibility, but friendly, social, and humane. His conversation is represented as having been highly agreeable, and his manners to have been those of the scholar and the gentleman.
the English who had landed were put to the sword. In his retreat, commodore Hawkins was obliged, for want of provisions, to put on-shore, at a creek in the bay, half of
his remaining crew. With the rest, after undergoing great hardships, he reached England, in January 1566. This ill-success damped his ardour for maritime enter-
prise, and he determined to adopt the same profession; but the design was changed when he read of knighthood, and the commendations of the queen. In 1590 he had the command of a squadron which, in conjunction with that under sir Martin Frobisher, was sent to blockade the coasts of Spain, and intercept the plate-reefs. They failed in their attempt upon the island of Falsa; yet their cruise proved very distressing to the Spanish commerce, and maintained the English superiority at sea. The concluding service of sir John Hawkins was in 1595, when, in consequence of the proposal of himself and sir Francis Drake to attack the enemy in the West Indies, he was appointed to the command of a squadron of men-of-war, which joined a larger number of ships under Drake. In this action Hawkins unfortunately differed in opinion, and Hawkins was obliged to give way. Hence their attempt on the Ca-
ribean islands proved unsuccessful; and the time lost there, and afterwards at Dominica, rendered the success of the re-
sultless. Sir John Hawkins had the command of a vessel in an expedition to the West Indies under his uncle, captain William Hawkins. He commanded the queen's ship the Swallow in the action, with the Spanish armada, and distinguished himself on the occasion. He afterwards cruised with his father and Frobisher on the Spanish coast, and, upon his return, entered in the bold design of a voyage to the South Sea. Upon this expedition he failed in June 1593, with three vessels of his own, and proceeded to the coast of Brazil. He burnt one of his smaller vessels, and was defeated by the other; so that he failed through the straits of Magellan alone. He coasted along the western side of South America, and he was joined by a squadron, to which, after a gallant resistance, he was obliged to strike. After a confinement of upwards of two years in Peru and the adjacent provinces, he was liberated. Nothing is known concerning him after his return to England, till his death in 1622, which happened from an apoplectic fit, while attending the privy-
 council. At this time he had in the press a work, which soon after appeared, under the title of, The Observa-
tions of Sir Richard Hawkins, Knight, in his Voyage to the South Seas, A. D. 1593, folio, London, 1622.
HAWKINS (sir John), a celebrious writer, born in Cork harbour, ten miles below Cork. Previous to its incorporation in 1792, it was called Plantation No. 7, and had 539 inhabitants. —It is
called the town of the American States, in Hampshire county, Massachusetts, 120 miles westerly of Boston. Previous to its incorporation in 1792, it was called Plantation No. 7, and had 539 inhabitants. It is
composed of parts of several adjoining towns, and is situated about twenty miles north-west of Northampton.
HAWKINS, or HAMES, f. The crooked timbers round a horfes's collar.
HAWLS, or HAMES, f. In botany. See Hieracium.
HAWTHORN, f. in botany. See CRATAEGUS.
HAWTHORN-BERRY, f. The fruit or seed of the hawthorn.
HAWTHORN-BUSH, f. The white thorn, a white thorn grown bushy.
HAWTHORN-HEDGE, f. A quick hedge, a hedge consisting chiefly of hawthorn.
HAWYE, f. A river of Wales, which runs into the Ython, in the county of Radnor.

HAY, f. [L. alce, Sax. hey, Dut. hooie.] Gras fried to fodder cattle in winter.—Make hay while the sun shines. Camden.—For a defection of the best grass for hay, see the article GRASS, vol. vii. p. 790.—See also the article Husbandry.

Carts of hay, which stand to be sold in the Hay-market, London, are to pay three-pence, and draw one penny, per load; and shall not stand loaden with hay after three o'clock in the afternoon, &c. on pain of forfeiting five shillings. Hay fold between the first of June and the last of August, being new hay, is to weigh sixty pounds a-truf, and old hay the rest of the year fifty-five pounds, under the penalty of one shilling and five pence for every truf offered to sale, Stats. a Will. and Mary. c. 8. & 9 Will. III. c. 17. 31 Geo. II. c. 49. Whitechaple hay-market, under flat. 11 Geo. III. c. 15, is open between the hours of eleven one in the afternoon, from Lady-day to Michaelmas, and from eight to twelve during the other half-year.

To dance the hay. To dance in a ring: probably from dancing round a hay-cock.—I will play on the tabor to dance the hay. Shakespeare.

HAY, adj. Belonging to hay, consisting of hay.
HAY, f. [French.] A hedge.—Hay-bote or hedge-bote, is wood for repairing hays, hedges, or fences. Blackstone.

HAY (L'), a town of France, in the department of Calvados, at a distance of fifteen miles from Caen, where it takes its name from the river Hay, which runs through it. It is a market town on Saturdays; and three fairs, on May 17, Ougust 12, and October 10. It is seated on the river Hay, over which it has a handsome stone bridge of seven arches. It stands on the north-east corner of the county; and was formerly fortified by the Romans with a caflle and wall. It is the birthplace of Henry IV., to whom it is due that the fury of a civil war; for Owen Glendour, when he took up arms against that king, not only burnt it to the ground, but laid waste all the parts adjacent; and nothing remains of its caflle but a mound of earth, and the intrenched round it. The town, as to its present state, is not contemptible; and has in its centre a curious Gothic gateway of a caflle, built after the destruction of its Norman one; but there are no farther remains of the second caflle except the entrance.

HAY (L'), a town of France, in the department of Orleans, on the river Loire.

HAY (L'), a town of France, in the department of Paris; one league and a half south of Paris.

HAY (William), a gentleman distinguished by various writings and books. Born at Glynsborne in Sussex, the seat of his father, who died soon after his birth, and left him heir of a moderate estate. After a preparatory education, he was sent to Oxfrod, where he remained till his twentieth year, and then removed to the Temple for the study of the law. He quitted that situation on account of ill-health, and made a tour on the continent. A weak constitution, accompanying a deformed body, caused him to pass several years in rural retirement, amusing himself with books, and the exercise of his pen. In 1743 he published An Essay on Civil Government, which proved him to have thought largely on that important topic. He entered into the married state in 1751, with Ann, daughter of Henry IV., by whom he had three sons, who arrived to manhood. He engaged in public life not long after his marriage, and was chosen member of parliament for the borough of Seaford, which town he continued to represent as long as he lived. He supported the ministry of Sir Robert Walpole, who rewarded his services, in 1738, with the place of commissioner in the Victualling-office. When this became incompatible with the parliamentary seat, he obtained the appointment of registrar of the records in the Tower of London. He was always an industrious attendant in the house of commons, and was always independent enough to dissent from measures which he disapproved. He published, in 1755, Remarks on the Laws relating to the Poor; of which a second edition, enlarged, was printed in 1756. In 1755, came out his伟大复兴, a work containing many solid and valuable observations. His Essay on Heroics in 1755, was the most popular of his writings. It had both the merit of novelty in the subject, and of a peculiar happiness in the mode of treating it, principally arising from the amiable satire with which the writer continually alludes to his own bodily conformation. His two poetical publications, a Translation of Hawkins Brown's Latin Poem on the Immortality of the Soul, and Translations and Imitations of select Epigrams of Martial, complete the list of his literary productions. He died of a paralytic stroke, in June 1755, aged sixty years. The embellishments of his mind made ample compensation for the inexpressible grief of his person. As an useful member of society, a magistrate, a critic, he will long remain an example worthy of imitation in others. In each of these characters his views were extended for the public good, without low or selfish designs; and his private and domestic life was highly beneficial to the circle within its influence. From the time he began to reside in Sussex, he devoted his thoughts to the improvement of his estates, endeavored against neglect, cultivated gardening in almost all its branches, and was perhaps the first who began to ornament cornfields with walks and plantations. He also endeavored to make usefull experiments a part of the amusements of his family. In 1743, a small quantity of silk was manufactured in Spitalfield, from silk-worms bred at his house, sufficient to answer the purpose of proving that good silk can be produced in England, though at an expense too great perhaps to make it an article of trade, on account of the price of labour. His diligent study of the law in the early part of his life, well fitted him for a magistrate. For after seventeen years he had studied the commerce of the peace, and constantly attended all the meetings in the division to which he belonged. He never refused to see those persons who applied to him for justice, though their numbers often made it fatiguing to him; his meals, or his company, were left by him, that he might not lose those waiting who came from a distant place; and if he had leisure to receive any, he was seldom absent when they came. His activity did not stop here, for he was many years chairman of the quarter-seions for the eastern division of his county. His unwearying endeavours in parliament to obtain amendment in the laws relating to the poor, prove that his heart, as well as head, was engaged in that business. Though he is mentioned as a supporter of the measures of Sir Robert Walpole, yet he was always discriminative, and on every occasion thought for himself. When he was clearly of an opinion contrary to those with whom he usually acted, he was not content with giving a silent vote against what they proposed, but publicly declared the reasons for his dissent. It has been long since remarked, that such men are not often the favourites of any party. Two of his sons survived him. The eldest, Thomas, rose to be lieutenant-colonel of the queen's dragoons. He afterwards filled the fame command in the suffolk militia, represented the borough of Lewes in two parliaments, and died in 1786. The second son, William, represented the borough of Lewes for ten years in the civil department, and enjoyed a high reputation; but remaining a hostage with Meer Collim, he was most cruelly put to death in 1753. The works of Mr. Hay, which
which had long lain dispersed in detached pieces, were collected, and judiciously arranged, and published in two elegant volumes 4to. in 1794.

HAY-BOTE, f. [from hauve, Fr. and bote, Sax. com-prentatio.] A liberty, in some certain tenures, to take wood to make and repair hedges, gates, fences, &c. either for lifetime or years: it is also said to be wood for the making of lances and forks with which men make hay. Co. Lit. 41.

HAY-COCK, f. A small parcel of hay raked together during the proceeds of hay-making:

Or if the earlier season lead
To the tann'd hay-cock in the mead. 

Milton.

HAY-COCKS, a small island of the American States, in Delaware river, about seven miles below Easfon in Northampton county, Pennsylvania.

HAY-LOFT, f. A loft to put hay in.

HAY-MAKER, f. One employed in drying grass for hay.

HAY-MOW, f. A hayrick, a mow of hay.

HAY-RICK, f. A roll of hay.

HAY-STACK, f. A mow of hay.

HAYANGE, a town of France, in the department of the Meurthe, and chief place of a canton, in the district of Nancy, four leagues west of Nancy, and five north of Contances.

HAYER (John-Nicholas-Hubert), a learned French ecclesiastic, born at Sar-Louis in 1718. He embraced the monastic life, and by his talents and learning recommended himself to the posts of professor of philosophy and theology among the Recollets. He died at Paris in 1780, at sixty-two years of age. He frequently held a post as the champion of revealed religion, in opposition to modern sceptics. The principal of his works were:

HAYES (Charles), an ingenious English mathematician, born in 1673. He entered early into the service of the Royal African Company, in whose employment he had a voyage to Africa. After he spent some years, and afterwards rose to the chief management of the African affairs at home. In 1731, he published a Treatise on Fluxions, in which he delivers the elements of that science in an easy and familiar manner, and is said to be the first work on the subject published in the English language. In 1715 he published A New and Easy Method to find out the Longitude, from observing the Altitudes of the Celestial Bodies, 4to. and in 1723, The Moon, a Philosophical Dialogue; intended to show, that the moon is not merely a dark and opaque body, but that its poiseless no inconsiderable share of native and original light. The Septuagint version of the Old Testament he held in the highest estimation; and, after examining the history of that version which passes under the name of Arilaeus, he undertook to write a defence of that performance against the objections of modern critics. This piece he published in 1736, under the title of A Vindication of the History of the Septuagint, &c. 8vo. His next work made its appearance in 1735, and displays much learning and ingenuity, in an endeavour to ascertain, fully and clearly, the true year of the maternity of Christ. It is entitled, A Critical Examination of the Holy Gospels according to St. Matthew and St. Luke, with regard to the History of the Birth and Infancy of our Lord Jesus Christ, 8vo. In 1742 he exhibited another specimen of his erudition by publishing A Dissertation on the Chronology of the Septuagint; shewing, that the Chaldaean and Egyptian Antiquities, hitherto esteemed fabulous, are perfectly consistent with the Computations of that most ancient version of the Holy Scriptures, 8vo. To this dissertation he added a supplement in 1747, containing a complete series of the kings of Argos and Athens from Ixion, and of the old emperors of China from Pothi to the birth of Christ; at the same time undertaking to show, that the chronology of all these nations perfectly agrees with the Septuagint. In 1753, he commenced a laborious undertaking for a period seventy-five years of age; which was, to compile a work in Latin, under the title of Chronographia Asiatica & Erygptiae ab Origo mundi usque ad annum 5500, ed Fidelis Seriptorum Veritatis, 1211, 12mo. From the first part of the author attempts to show, that both the septuagint interpreters, and Josephus, took their system of chronology
logy from several ancient writings (distinct from the sacred books of the Old Testament,) which had for many ages been carefully preserved by the priests, in the library belonging to the temple of Jerusalem. He did not long survive this publication, as he died in 1760, in the eighty-second year of his age.

**HAYES (Dr. Philip),** a celebrated English musician and composer, professor of music in the university of Oxford. He was supposed to be the largest man in England, and nearly equal in weight to the famous Bright. He was made doctor of music in 1777; and died in London, March 19, 1797. He had lately come to town, in order to attend the opening festival for the New Musical Fund. He drest himself in the morning, to attend the chapel-royal, St. James's; but suddenly showed symptoms of approaching dissolution, and expired in a short time afterwards. His remains were interred in St. Paul's cathedral. The corpse, on entering the church, was met by the gentlemen of the choir of the chapel-royal, St. Paul's, and Westminster-abbey, who sang Dr. Green's funeral anthem, "Lord, let me know my end," &c. Dr. Arnold and a number of other musical gentle

men attended the obsequies.

**HAYES, rocks** near the north-east coast of the island of Guernsey, between the small islands of Harnet and Humnet.

**HAYES ISLAND,** a small island of New South Wales, formed by the rivers Nelfon and Hayes. At the mouth of Nelfon river stands Fort York; which, as well as Nelfon river, is called Burton's by the French.

**HAYGER, or HEGER,** a town of Germany, in Westphalia, and principality of Nassau Dillenburg; three miles north-east of Dillenburg.

**HAYLISHAM.** See HAILSHAM, p. 162.

**HAYM (Nicholas-Francis),** a musician and scholar, native of Rome. He came to London early in the eighteenth century; and associating himself with Clayton an Englishman, and Dicrpart a Frenchman, he aided in the introduction of Italian music into England, and composed operas and other pieces. The arrival of Handel superceded their plans; and Haym employed himself in writing operas, which were set by that great master. Being skilled in antiquities, he formed a plan of publishing to the world such remains of antiquity as were then found in England. This he executed with respect to coins and medals; and published them in a work entitled, Tetrarum Britannicam, Parte I. de Maffe Numerario, seu de contengono le Medaglie Greche e Latine in ogni Metallo e' Forma, non prima publicate, Lond. 1719-1720, 2 vols. 4to. It was published at the same time in English, and an edition in Latin was printed at Rome in 1762, with a view, perhaps, at the time, to their being printed for the benefit of learned foreigners. Besides his situation at the mint, Mr. Haynes discharged the duties of principal tally-writer of the exchequer for the time, to their being printed for the benefit of learned foreigners.

**HAYNES (Hopton),** a distinguished assayer, born in 1672. In 1696 he entered into the service of his majesty's mint, in which he continued till he rose to the office of the keeper. He first attended the mint, led to an intercourse between himself and Sir Isaac Newton, during which he acquired the esteem and confidence of that most eminent philosopher. In the Prolegomena to Whittein's edition of the Greek Testament it is related, that Mr. Haynes had been employed in translating into Latin two letters of Sir Isaac Newton on the true reading of 1 John v. 7, 8, and 1 Tim. iii. 16, with a view, perhaps, at the time, to their being printed for the benefit of learned foreigners. Besides his situation at the mint, Mr. Haynes discharged the duties of principal tally-writer of the exchequer for above forty years, with great diligence and fidelity. He died in 1749, aged seventy-seven years. He was author of The Scripture Account of the Attributes and Worship of God; and of the Character and Offices of Jesus Christ. He was the author of a production in support of the Unitarian doctrine. He died however while this work was in the press; but the printing of it was finished in 1752 in 8vo. A new edition of it was published in 1752, with an introductory preface, by the Rev. Theophilus Lindsey.

Mr. Haynes had a son named Samuel, who was educated to the church, and, after he had taken his degree of M. A. was appointed tutor to the earl of Salisbury, with whom he made the tour of the continent. In 1737 the nobleman rewarded him by a presentation to the rectory of the valuable rectory of Hatfield in Hertfordshire. In 1734 he succeeded Dr. Snape in a canonry of Windsor; and in 1747 was presented by his noble patron to the rectory of Clothall in Hertfordshire. He died in 1752. He published A Collection of State Papers, relating to Affairs in the Reign of Henry VIII. Edward VI. Queen Mary, and Queen Elizabeth, from the Year 1542 to 1572; transferred from Original Letters and other authentic Memorials, in the Library of the Right Honourable the Earl of Salisbury; folio, 1745.

**HAYNES FORT,** a strong fort built by Colonel Haynes, and situated in Nellon county, Kentucky, on the north fork of Green river, twenty-five miles west of Craig's Fort, and fifty-three from the Ohio.

**HAYNICHEN,** a town of Germany, in Upper Saxony; eight miles west-north-west of Fremeberg, and twenty-five miles west of Dresden.

**HAYNSBERG,** a town of Germany, in Upper Saxony, and bishopric of Naumburg; three miles south-west of Naumburg.

**HAYLI,** the revived Indian name of the black empire in St. Domingo. See HISPANIOLA.

**HAYWARD,** [from the French, haya, a hedge, and garde, custody.] One who has the care of a common herd
of cattle of a town: one part of whose office is to see that they neither break nor crop the hedges of inclosed lands. He is an officer appointed in the court leet or baron, and is to look to the fields, and impound cattle that trespass therein; to inspect that no pound-breaches be made; and, if any be, to prevent them at the court. Kelt. 46.

HAYWARD (Sir John), an English historian, educated at Cambridge, where he took the degree of LL.D. He published in 1599 The first Part of the Life and Reign of Henry IV. which he dedicated to the earl of Essex, and was appointed by King James, in 1610, one of the historiographers of his intended college of controversial divinity at Chelsea. At the desire of Prince Henry he composed the Lives of the three Norman Kings of England, 4to. 1630. As an historian he obtained most credit for the Beginning of the Reign of Queen Elizabeth, v. as published his Life and Reign of King Edward VI.

His Life of Henry IV. which, Bishop Nicholson observes, is imitated the ancient practice of putting speeches in the style, though some judged it to be too dramatical. He gave him the repute of a good clean pen, and smoothness of expression, and is called by Kennet a professional speech-maker.

HAY-WOOD FORT, a fort of the island of Barbadoes: one mile and a half north of Speight's-town.

HAZ, f. with astrologers, the dignity of a planet, heightened by some favourable circumstances or situation.

HAZ-OGHU-BE.ZARZICH, or Agio-Basarco, a town of European Turkey, in the province of Bulgaria. The town is commercial, and inhabited by many rich Armenians: thirty-eight miles south of Driftra.

HAZAPAH, [Hebrew.] A man's name.

HAZAR-AD-DAR, or Adar, a city of Palestine, belonging to the tribe of Judah; situated on the southern boundary of that province, and very probably belonging to that country. Numb. xxxiv. Ezek. xlvii. 17, xviii. 1.

HAZAR-GAD-DAH, a city of Palestine, belonging to the tribe of Judah; situated in the southern part of the province, near the borders of Edom. Josh. xv. 27.

HAZAR-HATTICON, the name of a place mentioned Ezek. xlvii. 16.

HAZAR-SHUAL, a city of Palestine, belonging to the tribe of Judah; situated in the southern part of that province, near the borders of Edom: it was afterwards assigned to the tribe of Simeon, as their inheritance was included within that of Judah. Josh. xxv. 13. xix. 3.

HAZAR-SUSAI, or Hazar-Susim, a city of Palestine, belonging to the tribe of Simeon. Josh. xix. 5. 3 Chron. iv. 31.

HAZARD, f. [hazard, Fr. aazar, Span. haza, Runic; danger.] Chance; accident; fortuitous hap.—Where the mind does not perceive connection, there man's opinion is not the product of judgment, but the effects of chance and hazard. Locke.

I have met my life upon a cast, And I will flend the hazard of the die. Shakespeare.

Dangers; chance of danger. —Men are led on from one stage of life to another in a condition of the utmost hazard, and yet without the least apprehension of their danger. Rogers.—A game at dice.—The duke playing at hazard, held in a great many hands together, and drew a huge heap of gold. Swift.

To HAZARD, v. u. [hazarder, Fr.] To expose to chance; to put into danger. —They might, by perfiling in the extremity of that opinion, hazard greatly their own estates. Hooker.—By dealing indifferently mercies to all, you may hazard your own share. Sherlock.

To HAZARD, v. n. To try the chance. —Pause a day or two, before you hazard. Shakespeare.—To adventure; to run the danger:

She from her fellow-provinces would go, Rather than hazard to have you a foe. Waller.

HAZARD, or Richmond Bay, a bay in Hudson's Bay, on the west coast of Labrador, with a great number of small islands, called Artic islands, by the Indians of the country. Lat. 55. 56. long. 52. 53. W. Greenwich.

HAZARDBABLE, adj. Venturous; liable to chance. —An hazardous determination is, unto fluctuating and indifferent effects to affix a positive type or period. Brown.

HAZARDER, f. He who hazards.

HAZARDERY, f. Temerity; precipitation; rash adventuromenafs. Obsolete.

Hasty wrath, and needless hazardry,
Do breed repentance late, and lasting infamy. Spenser.

Playing at hazard:

Some fell to dance; some fell to hazardry;
Some to make love; some to make merriment. Spenser.

HAZARDUS, adj. [hazardus, Fr. from hazard.] Dangerous; exposed to chance:

Grant that our hazardous attempt prove vain,
We feel the worst, secure from greater pain. Dryden.

HAZARDOUSLY, adv. With danger or chance.

HAZARDOUSNESS, f. The state of being hazardous.

HAZARDS, f. The holes in the side of a billiard-table.

HAZA'ZON-TA'MAR, or Haz'zon-Tamar, or En-Gedi, the feast of the Amorites in the days of the patriarch Abraham. Here the Moabites and Ammonites pitched against Jehoshaphat king of Judah. Gen. xv. 7. 2 Chron. xx. 2. See En-gedi.

HAZE, f. [the etymology unknown.] Fog; mist.—In the fog and hazes of confusion all is enlarged and appears without any limit. Burke.

To HAZE, v. n. To be foggy or milky.

To HAZE, v. u. To fright one. Ainworth.

Hazzeroock, a town of France, and principal place of a district, in the department of the North: six leagues and a half west of Lille, and six and a half south of Dunkirk. Lat. 50. 40. N. long. 2. 29. E. Ferrier.

HAZEL, f. [hazel, Sax.] The common nut-tree. See the article Corylus, vol. v. p. 246.

Kate, like the hazel twig, Is straight and slender, and as brown in hue As hazel nuts, and sweeter than the kernels. Shakespeare.

HAZEL, adj. Light brown; of the colour of hazel. —Chufe a warm dry soil, that has a good depth of light hazel mould. Mortimer.

HAZEL-NUT, f. The common small nut, the fruit of the hazel.

HAZEL-OPO'NI, [Hebrew; fliade and sorrow of the hazel.] The name of a woman. Ainjworth.

HAZEL, f. [hazel, Sax.] The common nut-tree. See the article Corylus, vol. v. p. 246.

HAZEL, adj. Light brown; of the colour of hazel. —Chufe a warm dry soil, that has a good depth of light hazel mould. Mortimer.

HAZEL-OPO'NI, [Hebrew; shade and sorrow of the hazel.] The name of a woman. Ainjworth.

HAZEL-Ly, adj. Of the colour of hazel; a light brown. Uplands consist either of sand, gravel, chalk, rock, or stone, hazel loam, clay, or black mould. Mortimer.

HAZERIM, the name of a city of ancient Canaan, mentioned by Moses as being the seat of the Avims, or Avites, who were dispossessed by the Caphtorims, who occupied the country in their stead. Deut. ii. 23. Josh. xiii. 3.

HAZEROTH, the thirteenth place of encampment of the Israelites in their journey from Egypt to Canaan. Numb. xi. 35. xxxiii. 17, 18.

HAZOR, a city of ancient Canaan, and the seat of one of the most powerful kings of that nation. It was taken
taken by Josua, who totally destroyed it with fire; notwithstanding, we again find the Israelites oppressed by the descendants of Jabin, king of the days of Deborah and Barak. Jos. xi. 10-12. Judges iv. 2.

HA'ZOR, a city of Palestine, belonging to the tribe of Naphtali; it was taken by Tiglath-pileser, king of Assyria, in the reign of Pekah king of Israel. Jos. xix. 36. 2 Kings. xv. 29.—Also the name of another city of Palestine, belonging to the tribe of Benjamin. Neh. xi. 31-32.—Likewise the name of two cities of Palestine, belonging to the tribe of Judah, situated in the southern part of that province, near the border of Edom. Jos. xiv. 25-26.

HA'ZOR, the name of a kingdom mentioned Jer. xliii. 28-33.

HAZ'ZU'BAH, [Hebrew.] A man's name.

HA'ZY, adj. Dark; foggy; misty.

Oft engender'd by the hazzy North,
Myriads on myriads, infett armies waft.

Thomson.

HE, pron. gen. kin; plur. they; gen. them: [ky.

Dut. he, Sax. It seems to have borrowed the plural from Sêr, plural Sêr, dative Sêron.] The man that was named before.—Feed, and regard him not. Shakespeare.

So cheer'd his fair spouse, and he was cheer'd. Milton.

Thus talking, hand in hand along they pass'd
On to their blissful bow'r.

Milton.

The man: the person. It sometimes stands without reference to any foregoing word:

He is never poor
That little hath, but he that much desires. Daniel.

HE, f. The man, or male being;

Such mortal drugs I have; but Mantua's law
Is death to any he that utters them. Shakespeare.

HE, adj. Male: a, he bear, a he goat.

HE'A, an extensive province of the kingdom of Morocco, in Africa, bordering on the Atlantic Ocean. A great part of this province is a sandy desert: but its maritime situation renders it favourable for commerce. The new town or city of Moixador is its capital; which see.

HEAD, f. [heap'd, heap'b, Sax. hopfel, Dut. koevel, old English, whence by contraction head.] The part of the animal that contains the brain or the organ of sensation and feeling of thought. —I could have offers, that some who held their heads higher would be glad to accept. Swift.

The dewy paths of meadows we will tread,
For crowns and chaplets to adorn thy head. Swift.

Perfon, as exposed to any danger or penalty.—What he gets more of her than sharp words, let it lie on my head. Shakespeare.

Who of all ages to succed, but feeling
The evil on him brought by me, will curfe
My head? ill fare our ancestor impire! Milton.

Denomination of any animals.—The tax upon pasturage was raised according to a certain rate per head upon cattle. Arbuthnot.—Chief; principal perfor; one to whom the rest are subordinate; leader; commander:

Your head I him appoint;
And by myself have sworn, to him shall bow
All knees in heaven, and shall confess him lord. Milton.

Place of honour; the first place.—Notwithstanding all the justices had taken their places upon the bench, they made room for the old knight at the head of them. Addison.—Place of command.—An army of four thousand troops, with the duke of Marlborough at the head of them, could do nothing. Addison.—Countenance;

preference.—Ere to-morrow's sun shall shew his head. Dryden.

With Cain go wander through the shade of night,
And never shew thy head by day or light. Shakespeare.

Understanding; faculties of the mind; commonly in a ludicrous sense. —We laid our heads together, to consider what grievances the nation had suffered under king George. Addison.—A fox and a goat, a wall to drink; the goat fell to hunting which way to get back; Oh! says Reynard, never trouble your head, but leave that to me. D'Urfange.—Face; front; fore-part:

The gathering crowd pursues;
The raveliers turn head, the light renews. Dryden.

Resistance; hostile opposition. —Sometimes hath Henry Bolingbroke made head against my power. Shakespeare.

Then made he head against his enemies, And Hymner flew. Fairy Queen.

Spontaneous resolution.—The bordering wars in this kingdom were made altogether by voluntaries, upon their own head, without any pay or commissione from the state. Davies. —State of a deet's horns, by which his age is known—The buck is called, the fifth year, a buck of head. Shakespeare. —Individual. It is used in numbers or computation,—If there be fix millions of people, then there is about four acres for every head.

Granta.—The top of any thing bigger than the rest.—His spear's head weighed six hundred thousand iron bars. Sam. —If the buds are made our food, they are called heads or tops; fo heads of apricots or apples. —Head is therefore an equivocal term; for it signifies the head of a nail, or of a pin, as well as of an animal. Watts.

As his proud head is rais'd towards the sky,
So low 'toward his roots descend. Denham.

The fore-part of any thing, as of a ship. —By gallies with heads the might transport over Indies at once three thousand hundred soldiers. Raleigh.

His gallies mow;
Their heads are turn'd to sea, their stens to shore. Dryden.

That which rises on the top.—Let it stand in a tub four or five days before it be put into the case, stirring it twice a-day, and beating down the head or yeat into it. Mortimer. —The blade of an axe. —A man fetched a stroke with the axe to cut down the tree, and the head split from the helve. D'Urfange. —Upper part of a bed. —Israel bowed upon the bed's head. Gen. xlvii. 31.—The brain:

As eastern priests in giddy circles run,
And turn their heads to imitate the sun. Pope.

Drefs of the head.—Ladies think they gain a point when they have teazed their husbands to buy them a laced head. Pope. —To imitate the sun.

His gallies mow;
Their heads are turn'd to sea, their stens to shore. Dryden.

That which rises on the top.—Let it stand in a tub four or five days before it be put into the case, stirring it twice a-day, and beating down the head or yeat into it. Mortimer. —The blade of an axe. —A man fetched a stroke with the axe to cut down the tree, and the head split from the helve. D'Urfange. —Upper part of a bed. —Israel bowed upon the bed's head. Gen. xlviii. 31.—The brain:

As eastern priests in giddy circles run,
And turn their heads to imitate the sun. Pope.

Dress of the head.—Ladies think they gain a point when they have teazed their husbands to buy them a laced head, or a fine petticote. Swift. —Principal topic of discourse. —'Tis our great interest and duty to satisfy ourselves on this head, upon which our whole conduct depends. Atterbury. —Source of a stream. —It is the glory of God to give: his very nature delighteth in it; his honours in the current, through which they would pass, may be dried up, but at the head they never fail. Hooker.

Beneath a laurel shade, where mighty Po Mounts up to woods above, and hides his head below. Dryden.

Crisis; pitch. —The indiposition which has long hung upon me, is at last grown to such a head, that it must quickly make an end of me, or of itself. Addison.—Power; influence; force; strength; dominion;

Within her breath though calm, her breath though pure, Motherly cares and fears got head, and rais'd some troubled thoughts. Milton.

Body; confusion. —A mighty and a fearful head they are. Shakespeare.
Let all this wicked crew gather Their forces to one head. Ben Jonson.

Power; armed force.—My lord, my lord, the French have gather'd head. Shakespeare.

At sixteen years, When Tarquin made a head for Rome, he fought, Beyond the mark of others. Shakespeare.

Liberty in running a horse:—He gave his able horse the head, And bounding forward struck his agile heels Against the panting sides of his poor jade Up to the rowell-head. Shakespeare.

Licence; freedom from restraint; a metaphor from horsemanship.—God will not admit of the passionate man's apology, that he has so long given his unruly passions their head, that he cannot now govern nor control them. South. It is very improperly applied to roots: How turnips hide their swelling heads below, And how the cloven cedworts upwards grow. Gay.

HEAD, s. The head of an anchor, is the shank or longest part of it.

HEAD OF A CAMP, a military term, is the ground before which the army is drawn out.

HEAD OF FLAX, is twelve fists of flax tied up to make a bunch.

HEAD OF WORK, in fortification, the front of it which is next the enemy, and farthest from the body of the place.

HEAD AND EARS. The whole person: In jingling rhimes well fortified and strong, He fights intrench'd o'er head and ears in song. Granville.

HEAD AND SHOULDERS. By force; violently. —People that hit upon a thought that tickles them, will be still bringing it in by head and shoulders, over and over, in several companies. L'Estrange.

HEAD, adj. Chief; principal; as the head workman; the head inn. —The horse made their escape to Wincheter, the head-quarters. Garrudon.

HEAD, v. t. To head; to influence; to direct; to govern.

To HEAD, s. n. To head; to influence; to direct; to govern.

Abas, who seem'd our friend, is either fled, Or what we fear, our enemies does head. Dryden.

Tohead; to kill by taking away the head. —If you head and hang all that offend that way but for ten years together, you'll be glad to give out a commission for more heads. Shakespeare. —To fit any thing with a head or principal part: Headed with fints, and feathers bloody dy'd, Arrows the Indians in their quivers hide. Gay.

If ever with airy horns I planted head's, —There is not so variable a thing in nature as a lady's head-dress: I have known it rise and fall. Addison.

And a conftable, a man of fame, —I have known it rise and fall. Addison.

A filet for the head; a top-knot. Pope.

A fillet for the head; a top-knot. Prideaux.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.

A discompos'd head-dress, —There is not so variable a thing in nature as a lady's head-dress. Pope.
rope which terminates the fall on the upper edge to
which it is fastened.
HEAD-SAIl, f. A fail that belongs to the fore-part
of the ship.
HEAD-SEA, f. A sea term: a great wave coming
directly towards the head of the ship.
HEAD-SILVER, f. The fine of forty pounds or up¬
wards, which the sheriff of Northumberland heretofore
exacted of the inhabitants twice in seven years.
HEAD-STILL, f. Part of the bridge that covers the
head.—His horse, with a half-check'd bit, and a head-
still of his, had been oft enough burnt. Shakespeare.
HEAD-STONE, f. The first or capital stone.—The
stone, which the builders refused, is become the head-
stone. By. cxviii. 24.—A stone at the head of a grave.
HEAD-TO-WIND, adj. Having the head of the ship
directly to the wind.
HEAD-WAY, f. The act of moving forward; the
motion of advancing; room for the head to pass.
HEAD-WORKMAN, f. The foreman, or chief ser¬
vant over the reft. Properly 'two words.—Can Wood
be otherwise regarded than as the mechanic, the head¬
workman, to prepare furnace and flamps? Swift.
HEADER, f. One that heads nails, or pins. In ma¬
forty, the first brick in the angle.—If the header of one
side is toothed as much as the flretcher on the out¬
side, it would be a stronger tootthing, and the
joins of the headers of one fide would be in the middle
of the headers of the course they lie upon of the other
side. Moxon.
HEADFAST, f. A sea term: a rope employed to
fallen the head of a ship.
HEADFORD, a town of Ireland, in the county of
Galway: twelve miles north of Galway.
HEADINESS, f. Hurry; rashness; flubbornnes; pre¬
cipitation; obduracy.—If any will rally blame fuch his
choice of old and unwonted words, him may I morejudly
headlong.—Him I may more judly blame and
headlefs.—Heads broke on our associates bleeding backs.
And headlong lab'ring till they blunt their axe. Dryden.
HEADSTRONG, adj. Unrestrained; violent; un¬
governable; refolute to run his own way; as a horse
whole head cannot be held in.—An example, for head¬
strong and inconfiderate zeal, no lefs fearful than Achi¬
tophel for proud and irreligious widom. Hooker.
Now let the headstrong boy my will controul;
Virtue's no flave of man: no fex confines the foul:
I, for myself, th' imperial feat will gain,
And he thall wait my leisure for his reign. Dryden.
HEADSTRONGNESS, f. Stubbornnes; obstinacy.
HEADY, adj. Raffi; precipitate; haity; violent; ungovernable; hurried on with pillon.—Men, naturally
warm and heady, are transport'd with the greatest flush
of good-nature. Addison.
Take pity of your town and of your people,
While yet the cool and temp'rate wind of grace
O'erblows the filthy and contagious clouds
Of heady murder, spoil, and villainy. Shakespeare.
Apt to affect the head.—I was entertained with a fort
of wine which was very heady, but otherwife seemed to
be fack. Byll.
Flow, Weftfead! flow, like thine inspirer, beer;
Heady, not strong; and foaming, though not full. Pope.
Violent; impetuous:
Never came reformation in a flood
With such a heady current fcow'ring faults;
Nor ever hydr-a-headed wilfulnfs
So foon did lofe his feat. Shakespeare.
To HEAL, v. a. [halgan, Goth. helcan, Sax. hecan,
Dut.] To cure a perfon; to refore from hurt or fick¬
nes.—I will refore health, and heady thfe of thy wounds.
Jer. xxx.—To cure a wound or defemer.—Thou haft
no healing medicines. Jer. xxx. 13.—To perform the aft
of making a fole to oratine, after it is cleansed.—After
feparation of the efchar, I deterged and
HEADSTRONG, f. Stubs; obduracy; headlefsness; in¬
comfort.—I will redore health, and
headlong.—To cure a wound or defemer.—Thou had
nefs.—I will redore health, and

HEAD, f. The ftep of moving forward; the
part. adj.
HEADLING, adj. Steep; precipitous. Raffi;
thoughtlefs. Sudden; precipitate.—It suddenly fell
from an excefs of fentour, which many examples having
taught them, never flop his race till he came to a head¬
long overthrow. Sidney.
HEADLONG, adv. With the head foremost. It is
often doubtful whether this word be adjectuve or adverb:
Headlong from thence the glowing Fury springs,
And o'er the Theban palace spreads her wings. Pope.
Raffily; without thought; precipitately.—To give Ahab
fuch warning as might infallibly have prevented his de¬
ftruction, was esteem'd by him evil; and to push him on
headlong into it, becaufe he was fond of it, was accounted
good. South.
Some ask for envi'd pow'r, which public hate
Purifies, and hurries headlong to their fate. Dryden.
Haftily; without delay or refpite:
Unhappy offspring of my teeming womb!
Dragg'd headlong from thy cradle to thy tomb. Dryden.
HEADFORD, a town of Ireland, in the county of
Galway: twelve miles north of Galway.
HEADINESS, f. Hurry; rashness; stubbornness;
precipitation; obstinacy.—If any will rashly blame
such his choice of old and unwonted words, him may I
more judly blame and condemn, either of witnesses
injudicious and headlong. Pope.
Now let the headstrong boy my will controul;
Virtue's no slave of man: no sex confines the soul:
I, for myself, the imperial seat will gain,
And he shall wait my leisure for his reign. Dryden.
HEADSTRONGNESS, f. Stubbornness; obstinacy.
HEADY, adj. Rush; precipitate; hasty; violent;
ungovernable; hurried on with passion.—Men, naturally
warm and heady, are transport'd with the greatest flush
of good-nature. Addison.
Take pity of your town and of your people,
While yet the cool and temperate wind of grace
O'erblows the filthy and contagious clouds
Of heady murder, spoil, and villainy. Shakespeare.
Apt to affect the head.—I was entertained with a fort
of wine which was very heady, but otherwise seemed to
be sack. Byll.
Flow, Weftfead! flow, like thine inspirer, beer;
Heady, not strong; and foaming, though not full. Pope.
Violent; impetuous:
Never came reformation in a flood
With such a heady current flowing faults;
Nor ever hydr-a-headed wilfulness
So soon did lose his seat. Shakespeare.
of a building. The healing is various; as of lead, tiles, slate, slates, lead, earth, flour, &c.

HEAL'LY, adv. Without fickness or pain. Heath's.

HEALTHi'NESS, f. The state of health. Heath's.

HEALTH'SOME, adj. Wholesome, salutary. Not us'd. Shall I not then be stifled in the vault, To whose foul mouth no health'ome air breathes in, And there be strangled ere my Romeo comes? Shakespeare.

HEALTHY, adj. Enjoying health; free from sickness; hale, sound. The husbandman returns from the field, and from manuring his ground, strong and healthy, because innocent and laborious. South. Conductive to health; wholesome. Gardening or husbandry, and working in wood, are fit and healthly recreations for a man of study or business. Locke.

HEALTHY COVE, a bay of the island of Jamaica, situated on a river, about four days' journey from the sea, where the French have a factory; it is the residence of a mandarin.

HEAP, f. [heap, Sax. hop, Dut. and Scot.] Many little things thrown together; a pile; an accumulation. The dead were fallen down by heaps, one upon another. W. Sh. xviii. 23. —A crowd; a throng; a rabble. —A cruel tyranny; a heap of vassals and slaves, no freemen, no inheritance, no heir or ancient families. Bacon. —Clutter; number driven together:

An universal cry refounds aloud; The sailors run in heaps, a helpfull crowd. Dryden.

To heap, v. t. To throw on heaps; to pile; to throw together. —Heap on wood, kindle the fire. Ezek. xxiv. 10. To accumulate; to lay up. —Though the wicked heap up silver as the dust, and raiment as the clay; but the juit shall put it upon, and the innocent shall divide the filver. Job, xxi. 16. —How great the credit was, where in that oracle was preferved, may be gathered from the vain riches which were there heaped up from the offerings of all the Grecian nations. Temple. —To add to something else:

For those of old, And the late dignities heap'd up to them, We reit your hermits. Shakespeare.

HEAP'ER, f. One that makes piles or heaps. Heaping, f. The act of making heaps; the act of laying up in heaps.

HEAP'Y, adj. Lying in heaps:

Where a dim gleam the paly lanthorn throws
O'er the mid pavement the heap'y ruins;
Rais'd o'er the heap'y wretch, the branching elk
Lies fumbling fallen in the white aby's. Thomson.

To hear, v. n. [hep, Sax. horen, Dut.] To enjoy the fene by which sounds are distinguished. —The object of hearing is found, whose variety is fo great, that it brings in admirable store of intelligence. Holder. —Princes cannot fee far with their own eyes, nor hear with their own ears. Temple. —To listen; to hearken to; as, He heard with great attention:

4 A
So spake our mother Eve, and Adam heard, Well-pleas'd, but answer'd not.

To be told; to have an account: with of. I have heard by many of this man. (Acts, ix. 13.) I was bowed down at the hearing of it; I was dismayed at the feeling of it. (Heb. ix.)

Hear of such a crime. As tragic poets, since the birth of time, 

Ne'er feign'd. As the French ambaflador upon that inftant received.—Bees are called with sound upon brafs, and hearing. (Shakespeare.)

Tell thou the lamentable fall of me, And fend the hearers weeping to their beds. (Addison.)

Tell thou the hearers, where the dead are conveyed to the grave. A temple in which the dead are conveyed to the grave. (L'Esfrange.)

HEAR'N, v. n. [heareen, Sax.] To listen; to listen eagerly or curiously. He hearkens after prophecies and dreams. (Shakespeare.)

The chief part; the vital part; the vigorous or efficacious part. (Dryden.)

So pleasant a noise, than it suits their humour. (Locke.)

There's not a blessing individuals find, but some word steals and hearkens to the kind. (Pope.)

HEARKKEN, f. Litterer; one that hearkens.

HEARNE (Thomas), an induftrious antiquarian, fon of the paretherlands of White Waltham in Berkshire, where he was born, in 1660. His active and early genius being noticed by Francis Charny, esq; a gentleman who refided in the fame place, he generously lent him, at the age of thirteen, to the grammar-school of Bray; and in 1665, entered him at Edmund-hall, in Oxford, where he acquired a great taste for antiquarian reftudies, to which he was now shown a predilection. He took his degree of bachelor of arts, and became so attached to Oxford on account of the advantages it offered to his reftudies, that he refused to take orders, and fettle in a curator. He was fo confant a frequenter of the Bodleian library, that Dr. Hudson, the librarian, took him for his coadulator. He afterwards obtained the poft of Janitor, and in 1712 of second librarian, to which were added some other collegiate advantages. All these, however, he resigned through his confcientious fcruples of taking the oaths to George I. These fcruples had probably grown upon him in the course of his antiquarian fudies; for he had in his youth written a tract in order to undermine his patron, Mr. Churchill, to take the oaths, but without success. He continued to devote at the university, and avidly to pursue his great bufinefs of editing old authors, till his death in 1735. The works, edited by him amount to thirty-eight. Of these are some classics, fuch as Pliny the younger, Eutropius, Jullin, and Livy; but much the greater number are Chronicles, Annals, Lives, and other works, relative to the hisory and antiquities of England, the publication of which has entitled him to the gratitude of thofe engaged in fimilar pursuits.
And, better'd by cultivation, bear the grain
again,
Mortimer.

To find in the heart. To be not wholly averse—For
my breaking the laws of friendship with you, I could
find in my heart to ask your pardon. Sidney.—It is much
used in composition for mind, or affection.

HEART-HEAVINESS, f. Heaviness of heart. —By so much the more shall I to-morrow be at the height of heart-heaviness. Shakespeare.

HEART-QUELLING, adj. Conquering the affection; and let fair Venus, that is queen of love, with her heart-swelllingion, upon you smilé. —Spenser.

HEART-RENDING, adj. Killing with anguish:

Heart-rending news, and dreadful to those few who her relish, and her defires pursue; that death should licentious have to rage among the fair, the wife, the virtuous, and the young. —Wallace.

HEART-ROBBING, adj. Ectatic; depriving of thought. —Spenser.

Sweet is thy virtue, as thystelf sweet art; for when on me thou shinedst, late in face of the day, a melting pleasure ran through every part, and me revived with heart-robbing gladness. —Spenser.

HEART-SEED, f. in botany. See Cardiospermum.

HEART-SICK, adj. Pained in mind. —If we be heart-sick, or afflicted with an uncertain foul, then are we true deliers of relief and mercy. —Taylor.

—Mortally ill; hurt in the heart.

Good Romeo, hide thyself. —Nay, unless the breath of forrow flood.

The fair, the wise, the virtuous; and the young. —Shakespeare.

Yield up, O love, thy crown and hearted throne to tyrannous hate. —Shakespeare.

It is now mostly used in composition; as, hard-hearted.

He never like bullies, coward-hearted.

Attacks in public to be parted. —Gay.

To HEARTEN, v. a. To encourage; to animate; to stir up:

My royal father, cheer these noble lords, and hearten those that fight in your defence. —Shakespeare.

Thus heart'd well, and heart'd upon his prey, the youth may prove a man another day. —Dryden.

To melliorate or renovate with manure: the ground one year at rest; forget not then. With richest dung to hearten it again. —May's Virgil.

HEARTH, f. The pavement of a room on which a fire is made; the ground under the chimney:

Good luck befriend thee, son; for at thy birth the fairy ladies danc'd upon the hearth. —Milton.

The vanquish'd fires withdraw from every place; or, full with feeding, sink into a deep:

Each household genius shews again its face, and from the hearths the little lores creep. —Dryden.

HEARTH-MONEY, f. A tax levied by flat. 14 Car. II. c. 2. It was productive of great discontent, and in consequence thereof abolished.

HEARTILY, adv. From the heart; fully:

I bear no malice for my death; but those who fought it I could with more Christians; be what they will, I heartily forgive them. —Shakespeare.

Sincere; actively; diligently; vigorously. —Where his judgment led him to oppose men on a public account, he would do it vigorously and heartily; yet the opposition ended there. —Addison.

This entertainment may a free face put on; derive a liberty from heartiness, and well become the agent. —Dryden.

Heartiness, f. Sincerity; freedom from hypocrisy:

Vigour; eagerness. —The anger of an enemy represents our faults, or admonishes us of our duty, with more heartiness than the kindnees of a friend. —Taylor.

HEARTLESS, adj. Without courage; spiritless:

Thousands besides flood mute and heartless. —Cowley.

Heartless they fought, and quitted from their ground, while our's with easy victory were crown'd. —Dryden.

HEARTLESSLY, adv. Without courage; faintly; timidly.

HEARTLESSNESS, f. Want of courage or spirit; dejection of mind.

HEARTY, adj. Sincere; undifsembled; warm; zealous. —They did not bring that heartiness than the kindnees of a friend. —Taylor.

HEARTLESS, adj. Without courage; spiritless:

Thousands besides flood mute and heartless. —Cowley.

Heartless they fought, and quitted from their ground, while our's with easy victory were crown'd. —Dryden.

In full health. Vigorous; strong:

Whole laughs are hearty, though his jests are coarse, and loves you beft of all things, but his horse. —Pope.

Strong; hard; durable. —Oak and the like true hearty timber, being strong in all positions, may be better trusted in crofts and transverse work. —Wotton.

HEARTY-HALE, adj. Good for the heart:

Vein-healing verrens, and head-purging dill, sound savoury, and balm hearty-hale. —Spenser.

HEAT,
The notion caused by the approach or touch of fire. — Heat is a very brisk agitation of the inelastic parts of the object, which produces in us that sensation from whence is heat, in the object is nothing but motion. Locke.—The word heat is used to signify the sensation we have when we are near the fire, as well as the cause of that sensation, which is in the fire itself; and hence we conclude, that there is a sort of heat in the fire resembling our own sensation; whereas in the fire there is nothing but little particles of matter, of such particular shapes as are fitted for smiths to make. Fire is the cause of the sensation of burning.

To agitate the blood and spirits with action. — When he was well heated, the young orator could not stand before him; and we find the elder contend not for the gift, but for the honour. Dryden.

The investigation of the properties of heat, or caloric, and the importance of its agency in the grand laboratory of Nature, are objects of considerable interest to the philosophical world. It has been laid down as a maxim, that the principal agent employed to balance the power of attraction or cohesion, is fire. By the natural effect of attraction we should possess none but solid and compact bodies; but the caloric, unequally dispersed in bodies, tends to destroy this adherence of particles. Hence the metals and substances which compose this globe are subjected, on the one hand, to a general law which tends to bring them together; and on the other, to a powerful agent which tends to remove them from each other: and upon the respective energy of these two forces, the confidence of all bodies depends. When the attraction prevails, they are in a solid state; when the caloric is most powerful, they are in a fluid state; and when both forces appear to be the point of equilibrium between these two powers. The term heat, in common language, has a double signification; it is used indiscriminately to express a sensation of the mind; and an unknown principle, which is the exciting cause of that sensation. Philosophers and chemists in the latter sense. See the article Caloric, vol. iii. p. 634. The effects of heat are known and measured, first, by the peculiar sensations which it excites in animals; and, when considered as exciting those sensations, it is called feyble heat. Secondly, heat is known by the effect it produces on the thermometer. This is called the temperature of heat in bodies. It is found by experiment that in bodies of different kinds, the quantities of absolute heat may be unequal, though the temperatures and weights be the same. Heat has a constant tendency to diffuse itself over all bodies, animate and inanimate, till they are brought to the same temperature. Thus it is found, by the thermometer, that if two bodies, of different temperatures, are mixed together, or placed contiguous, the heat passes from one to the other till their temperatures become equal; and that all inanimate bodies, when heated, and placed in a cold medium, continually lose heat, till they are brought to the state of the surrounding medium. — See this subject most amply discussed and explained under the heads Fire, Light, and Caloric; in the article Chemistry, vol. iv. p. 179-189.

But though heat or caloric has a constant tendency to diffuse itself over all bodies; yet it does not permeate all bodies alike. This has been lately proved in a very satisfactory manner, by the interesting and curious experiments of Mr. Leflie, as given in his Enquiry into the Nature and Propagation of Heat, published in 1804. This ingenious philosopher provided himself with a peculiar apparatus, consisting of reflectors or specula, and of tubes containing hot water, formed on purpose to facilitate this enquiry. These reflectors were hammered out of block-tin, and highly polished, exhibiting great brightness, smoothness, and regularity of surface. When the tubes were exposed to the direct light of the sun, they collected the rays into a distinct focus, which was so powerful, that bits of wood or cloth, held in the focus, were burnt through, or set on fire, in a few seconds. The part of the apparatus intended to contain hot water, consisted of hollow tin tubes or canisters, formed exactly, and harmonized to a smooth and bright surface. The reflectors had an orifice at the middle of the upper side, from half an inch to an inch in diameter, and the same in height, fitted to receive a cap through which was inserted a thermometer, whose bulb might reach nearly to the centre of the water. The tubes were of different sizes of three, four, six, and ten inches. In two of
If heat, however, can be concentrated at a certain point, is one substance more qualified than another to receive such heat? Cover the focal ball with tinfoil, present the blackened side of the canister to the reflector, and the effect is $90^\circ$; present the bright side, and the effect is $12^\circ$, that it reflects bounding effects below were $100^\circ$, and $12^\circ$. Hence the power of tin to emit heat that can be concentrated, and to receive or absorb concentrated heat, is much inferior to the power of glass; and the two circumstances are concomitant, viz., the powers of emitting and absorbing heat. If glasses be received to absorb heat abundantly, then, to be different, the must say that the instrument is very small, and the same whether the back of the glasses spectrum be filtered or not, whether it is smooth or rough: but, if the front of the speculum be covered with tinfoil, then the effect on the thermometer is increased tenfold.

The human mind is so impatient during the interval which separates new and strange facts from acknowledged principles, that it soon forms for itself a mode of connection, and in some way unites effects with causes. To account for the curious facts which now present themselves, it might be supposed that heat is a fluid, but, if the front of the speculum was deftroyed: he placed a screen of plate glass, and the effect was $90^\circ$ at a certain distance, but less when the distance was increased; consequently, emitted heat does not permeate all bodies equally, nor similarly to light. If, instead of glass, a paper screen be used, the effect is $20^\circ$. "What then, asks Mr. Leslie, is this calorific and frigoric fluid after which we are enquiring? It is incapable of permeating solid substances. It cannot pass through tin, nor glasses, nor paper. It is not light, it has no relation to aether, it bears no analogy to the fluids real or imaginary, of magnetism and electricity. But why have recourse to invisible agents?"

Quod petis, hic est.

It is merely the ambient AIR!

"But how shall we explain the diversified effects of different screens? By all of them, the current or pulse of hot or cold air, in its progress towards the reflector, will be constrained. A body of a different substance from that of the reflector, the effect is $20^\circ$; any inclosure between the reflector and canister would account for the curious facts which now present themselves. The reflector and canister are differently heated; the current of heat, therefore, must remain stationary. But if, for instance, the ball which holds a portion of the liquid be warmer than the other, the superior elasticity of the confined air will drive it forwards, and make it rise in the opposite branch above the zero, to an elevation proportional to the excess of elasticity or of heat. The interval between freezing and boiling water being distinguished into 100 equal parts called centigrade, each of these subdivided decimally constitute the degrees which I employ, and which, following up the same system of nomenclature, would be termed milligrade. With the measures thus fixed, each differential thermometer will consist of 100 to 150 degrees. I would observe, however, that such graduation is seldom positively required, and that, in most cases, it is less important to know the absolute quantities of heat than their relative proportions."

The apparatus being fixed in a close room without a fire, the canister was placed opposite to the reflector, and one of the balls of the thermometer (called, for the sake of distinction, the focal ball) was placed in the focus of the reflector. Almost immediately, the coloured liquor rose. When the blackened side of the canister was opposed to the reflector, the effect was denoted by $100^\circ$; when a side covered with paper, by $98^\circ$; when a side covered with crown glasses, by $90^\circ$. Any one of these experiments, then, clearly manifests an accumulation of heat in the focus of the reflector; and, compared together, they indicate a flight alteration of effect attendant on the quality of the substance, of which the side of the heated canister is formed. Present to the reflector the polished side, or any side covered with tinfoil, and the liquor in the differential thermometer depressed to $12^\circ$. Here, then, is a manifest difference of effect; and, without trespassing against the cautionary precepts of inductive philosophy, we may safely say, that the power of emitting heat, so far as to be concentrated, is materially different in glasses and tin; and again, for the sake of convenience, glasses, paper, or lamp-black, as producing nearly equal effects, may be put in the same glass of substances that powerfully emit heat, which can be again concentrated.
From the preceding statements it appears, that these screens act merely as second canisters; but, to put the matter beyond all doubt, the author made the following extremely ingenious experiment:—Select two pieces of crown-glass, placing them with the thickest parts outmost: the liquor of the differential thermometer will now sink back again to the beginning of the scale. Such is the experimentum crucis. It establishes beautifully, and, I think, beyond the power of contradiction, the simple theory to which we have been led by a close train of induction. In both cafes the obstacle presented, or the compound screen, is absolutely the same. If the effects in the focus of the reflector were produced by some subtle emanation capable of permeating solid substances, how could such a singular contrast obtain?—It seems impossible to elude the force of this argument; but to confirm and illustrate the same conclusion, further experiments were made, which fully established the conclusion thus deduced.

From the concentration and accumulation of heat, then, on the focal point of the reflector, and from the stoppage of heat by the interposition of screens, it appears that a flow of heated matter proceeds from the heated canister. Would such a flow, under such circumstances, take place in non-elastic fluids? I do not believe it would. For water, for instance? The following experiment gives a decisive answer to this question: Place the apparatus within a large tub, and secure each separate part in its proper position. Fill the tub with cold water, so as to cover the whole, except a funnel folded to the mouth of the canister, and the vessel being thus distended, pour boiling water into the canister; and whether the reflector be water or air, the differential thermometer will not be at all affected. Thus, by means of these skilfully-conducted experiments, we arrive at two very important facts: first, that, in air and clastic fluids, bodies discharge part of their heat with powers and energies that depend on the quality of the heated surface; and, secondly, that in non-elastic fluids, this peculiar mode of discharging heat does not take place. This property, or mode of discharging heat, then, seems intimately to depend on the elasticity of the medium through which it is conveyed; and therefore may not heat be conveyed by the pulsations of the clastic medium, and, when the medium is water, by waves, more than by heat in a fluid in motion through bodies, and that the chief distinction consists in the velocity with which light impinges. If the velocity were less, the equality of incidence and reflection may be explained by the amazing velocity with which light impinges. If the velocity were less, the equality of reflection would not take place; and heat, therefore, impinging only with the velocity with which found is propagated, is imperfectly reflected; consequently, there must be an aberration in its focus; and the experiments before us clearly show that such is the fact.

Mr. Leslie introduces many strong arguments to prove, that light and heat are the same fluid; that light is propagated with a velocity so great as to sublime the contemplation of man; and that the chief distinction consists in the velocity with which the former is conducted. He further observes, that if a body be exposed to the sun's rays, it will, in every possible case, be found to indicate a measure of heat exactly proportioned to the quantity of light which it has absorbed; a fact which, if well founded, furnishes a logical inference that light and heat are identical.

The cooling or refrigerating principle is the next subject of discussion. Metal bodies conduct heat more rapidly than earthen, or vitreous, or wooden, bodies; and from this fact it has been inferred, that heated metal bodies cool faster in air than vitreous bodies: but the local experiments first related show, that the latter bodies emit a portion of heat, which can again be concentrated, more copiously than the former. There is, therefore, one cause why a vitreous ought to cool faster than a metal body. But in these experiments, it is proper to be governed by experiments, as the following:—(says Mr. Leslie) having placed a thin hollow globule of planished tin, four inches in diameter, and with a narrow neck, on a slender metal frame or foil, and retreating against the sharp edge, I filled it with warm water, and inferred a thermometer. The air of the room
Heat.

The exchange of heat between a body and its surroundings is a fundamental process in thermodynamics. When a body is in contact with a medium, heat is transferred from the body to the medium until a state of equilibrium is reached, where the temperature of the body and the medium are equal. The rate of heat transfer depends on various factors such as the temperature difference between the body and the medium, the material properties of the body and the medium, and the nature of the contact between them.

The process of cooling a body can be described by the equation:

\[ \frac{dH}{dt} = -k(\Delta T) \]

where \( H \) is the heat content of the body, \( t \) is time, \( k \) is the thermal conductivity of the body, and \( \Delta T \) is the temperature difference between the body and its surroundings.

The cooling process is accelerated by the exchange of heat with the surroundings, which is facilitated by the circulation of air or water around the body. The rate of cooling can be measured by the rate of decrease in temperature over time. The cooling process is often observed in experiments involving the cooling of hot objects in water or air.

In the context of the experiment described in the text, the cooling of a heated body was studied by measuring the rate of temperature decrease. The experiment involved the cooling of a heated body in contact with a medium, and the rate of cooling was found to be proportional to the temperature difference between the body and the medium.

The cooling process is also influenced by the properties of the medium, such as its thermal conductivity and specific heat capacity. The rate of cooling is faster in media with higher thermal conductivity and specific heat capacity, as these properties facilitate the exchange of heat between the body and the medium.

In summary, the cooling process is a fundamental thermodynamic process that governs the exchange of heat between bodies and their surroundings. The rate of cooling is influenced by various factors, including the properties of the body and the medium, and the nature of the contact between them. Understanding the cooling process is crucial for various applications, such as heat exchangers, cooling systems, and the design of thermal insulation materials.
contiguous shell of air, feel at once the pulsatory influence: the other particles, which constitute the general mass, probably imbibe their share of heat, and passively obey the impression of their augmented elasticity.

To determine the law of the rate of cooling with regard to the temperature, recourse was again had to experiments. Air, by repeated trials, found that at the temperatures 10°, 40°, 70°, the rates of cooling for a metallic surface were 2, 3, 4; and for a painted surface, 5, 6, 7. Consequently, if we increase the temperature by 10°, we increase the rate of cooling by 1, the pulsatory energy remaining the same. Hence, denoting by $P$ the pulsatory energy, and by an unknown quantity $v$, the refrigerating cause, independent of the nature of the heated surface, we have:

$$ P + v = 4 $\quad P + v = 2.$$  

Consequently, the portion of heat thus confined is more certainly not annihilated; neither is it transported to a distance, by any species of motion excited in the encircling fluid. It is, therefore, absorbed by the contiguous shell of matter, and afterwards slowly diffused through the extended mass. Air is still the sole medium by which heat endeavours to maintain the balance among remote or detached bodies; but here its operation is of a passive nature, and it receives and conveys the calorific impressions through its substance as in the finite manner as a bar of inflexible solid material.

This completes the analysis of the refrigerating action of air. There are four distinct modes in which it produces the effects: three of these are always conjoint, and the fourth only throws in its occasional influence. They all conspire to the same end, but their relative shares of operation are various and mutable. One source of communication depends on the quality of the heated surface, another on its elevation of temperature, a third on the permanent conducting disposition of the air, and afterwards slowly diffused through the extended mass. Air is still the sole medium by which heat endeavours to maintain the balance among remote or detached bodies; but here its operation is of a passive nature, and it receives and conveys the calorific impressions through its substance as in the finite manner as a bar of inflexible solid material.

Such is Mr. Leslie's beautiful analysis of the process of the cooling of heated vessels in elastic fluids, or atmospheric air:—the real cause of the difference in the rates of cooling is pulsation. This theory the author applies to explain an anomaly that shewed itself in one of his experiments above recited, viz. when the painted surface of the camiller was turned towards the reflector, and the bulb of the thermometer was covered with.tinfoil, the effect indicated was $4^2$ when the metallic surface was used, and the bulb was covered with the reflector; the effect indicated was only $2^2$: the procedure then being inverted, the same effects did not take place. The cause is thus affigned: the metallic bulb cools slower than the glass, and consequently is proportionally more affected by the same impression of heat.

This ingenious philosopher next proceeds to investigate the phenomena of refrigeration in non-elastic fluids; and the fluid which he chooses for the subject of his experiments, is water. A hot body placed in water is cooled, not by refrigeration, chiefly by two causes: first, the refrigerating power of the fluid, which acts in an elastic medium; a portion of the heat is uniformly absorbed by the surrounding water, and conducted through the internal mass, in the same manner as if it were congealed into solid ice; and the remaining portion is discharged by the slow recession of the heated particles. In water, however, the law of this refrigerating cause is not the same as in air, in which it varies amply as the excess of temperature; and the proof that the law is not the same is derived from experiment. Thus, suppose a ball containing hot water, and furnished with a thermometer, to be immersed in a water-bath, and the temperature of the bath to be in three experiments $100°,60°,$ and the corresponding temperatures of the immersed ball, $110°, 60°, 80°$; then in the first experiment the thermometer sinks $10$ degrees in six minutes; in the second $10$ degrees in $12$ minutes; and in the third, $10$ degrees in two minutes; but in air the expression for the time being:

$$ H = \log_2 \frac{\alpha + h}{\alpha + H} $$ \begin{align} \text{must evidently be} & \\ \text{the same, since} & \text{h and H are the same whether they} \\ \text{are} & \text{10, 0 and 20, or 40, 30, and 50, 30,} \\ \text{which indicates} & \text{30 degrees above zero, and, in its descent beyond this stationary limit,} \\ \text{again undergoes a slight dilatation. Water expands about the 24th part of its bulk between freezing and boiling; and glafs, in the same interval, expands longitudinally the 12000th part, and consequently its dilatation, in all the three dimensions, must amount to the 40000th part of its whole volume. The expansion of water that corresponds to any temperature

\[ x \text{ is therefore denoted by } \frac{x}{40,000} \]

Equating these two expressions, we obtain

\[ \frac{x}{24} = \frac{y}{40,000} \]

and therefore \( x = 60 \). This remarkable coincidence seems to dispel every shadow of doubt, and we may embrace it as an established fact, that the successive dilatations of water, counting from zero, are as the natural progression of numbers.¹

The most important question relating to this subject, which has agitated the minds of philosophers, is, whether heat be matter or motion. The ancients undoubtedly conceived that heat was material; and this opinion appears to have been generally received till about the time of Chancellor Bacon, who in his treatise De Corpore Calido, considers heat as the effect of an expansive undulatory motion in the minute particles of the body, by which they tend with some rapidity towards the circumference, and at the same time incline a little upwards; which idea was, with some modification, adopted by Descartes, Newton, Boyle, and other philosophers of that and the succeeding age. The modern chemists, however, from their being more used to the observation of the effects of this agent, in the innumerable experiments of more enlightened days, revived the doctrine of the materiality of heat; which doctrine again became general, and continued so, till some recent experiments of Count Rumford, which tended to prove that heat is considerabler, and capable of being produced ad infinitum from a finite quantity of matter, again involved the question in considerable doubt. It is an undoubted fact that when water freezes, a portion of heat is given out by it during the congelation, which is so considerable, that if we were to conceive it to be imbibed by an equal quantity of water at the temperature of 32° of Fahrenheit's thermometer, the latter would be heated no less than 140°, or to 172°. If, therefore, heat were a ponderable substance, it might be imagined that a given quantity of water would become lighter when frozen in a vessel hermetically sealed. Count Rumford accordingly made this experiment with great care by the help of a balance of extreme accuracy; but the result was, that the ice produced appeared to be of precisely the same weight as the water had originally been of at the temperature of 61°, viz. 4214·28 grains; from which he infers, that all attempts to discover any effect of heat on the apparent weights of bodies will be fruitless.

The other deduction, of the possibility of producing an inexhaustible supply of heat from a given quantity of matter, seems to have been suggested to count Rumford's mind. ²

By meditating on the results of these experiments, (says count Rumford,) we are naturally brought to that great question which has so often been the subject of speculation among philosophers, namely, What is heat? Is there any such thing as an igneous fluid? Is there any thing that can with propriety be called caloric?

We have now seen that a very considerable quantity of heat may be excited in the friction of two metallic surfaces, and given off in a constant stream or flux in all directions, without interruption or intermission, and without any signs of diminution or exhaustion. From whence came the heat which was continually given off in this manner in the foregoing experiments? Was it furnished by the water which surrounded the cylinder, or by the air? This could not have been the case; for in three of these experiments, the cylinder and the borer were surrounded with water, and at the same time did not impede the motion of the instrument. The quantity of water amounted to 1877 lbs. avoirdupois, and at the beginning of the experiment was at the temperature of 60°. After the cylinder had worked for an hour at the rate of 32 turns in a minute, the temperature of the water was 178°; and in 2 hours and 30 minutes after the experiment began, the water actually boiled. According to the computation of count Rumford, the caloric produced would have been sufficient to heat 265 lbs. avoirdupois of ice-cold water boiling hot; and it would have required nine wax candles of a moderate size, burning with a clear flame all the time the experiment lasted, to have produced as much heat. In this experiment all access of water into the hole in the cylinder where the friction took place was prevented. But in another experiment, the result of which was precisely the same, the water was allowed free access.

Was it furnished by the small particles of metal detached from the larger piece as they were being rubbed together? This, as we have already seen, could not possibly have been the case. Was it furnished by the air? This could not have been the case; for in three of these experiments, the machinery being kept immersed in water, the access of the air of the atmosphere was completely prevented. Was it furnished by the water which surrounded the machinery? That this could not have been the case is evident; first, because this water was continually receiving heat from the machinery, and could not at the same time be giving to and receiving heat from the same body; and, secondly, because there was no chemical decomposition of any part of this water. Had any such decomposition taken place (which indeed could not reasonably have been expected), one of its compound elastic fluids (most probably inflammable air) must at the same time have been set at liberty, and, in making its escape into the atmosphere, would have been detected; but though I frequently examined the water to see if any air-bubbles rose up through it, and had even made preparations for burning them, I could catch them in order to examine them if any should appear, I could perceive none; nor was there any sign of decomposition of any kind whatever, or other chemical processes going on in the water.

Is it possible the heat could have been supplied by
means of the iron bar to the end of which the blunt steel-borer was fitted; or by the small neck of gun-metal by which the hollow cylinder was united to the cannon? There is no position apparent which is improbable even to the eye; and, besides, it was found to be communicated through a Torricellian vacuum. And, in reasoning on this subject, we must not forget to consider that no matter must be visible to the eye, nor capable of being detected by it; hence the lightness of a body is imperceptible by our senses. It is hardly necessary to add, that any thing which can be perceived in the vicinity of the particles of matter is visible; and that the quantity contained in the heated body is not diminished by a portion of that becoming already heat, nor is it at any time rarer than the preceding, of which, though the heat was excited and communicated in the usual manner the heat was excited and communicated. A place overgrown with heath.—Health and long life have been found rather on the peak of Derbyshire, and the heaths of Staffordshire, than fertile soils. A place covered with shrubs of whatever kind.—Some woods of oranges, and heaths of roemey, will smell a great way into the sea. Bacon.

HEATH, f. in botany; see Erica. BERRIED HEATH; see EMPETRUM. SEA HEATH; see FRANK-ENIA.

HEATH, a township of the American States, in Hampshire county, Massachusets. It was incorporated in 1783 and is 135 miles north of Boston, and about eighteen miles north-north-west of Northampton.

HEATH (Benjamin), a learned lawyer, and town-clerk of Exeter. He published, in 1740, An Essay towards a demonstrative Proof of the Divine Existence, Unity, and Attributes; to which is prefixed, a short Defence of the Argument commonly called a priori. This is esteemed one of the best defences of Dr. Clarke's hypothesis. He employed much of his time in the study of the Greek language; and in 1763 published Note-five Lectiones, ad Tragicorum Graecorum veterum, Aeschyli, Sophoclis, Euripidis, qua superfuerant Dramata, deperditorumque reliquias. He was a learned scholar, and was highly esteemed by his contemporaries. He died in 1763, at the age of 70.

HEATH-COCK, f. The male of the Tetrao tetrix.

---Cornwall hath quill, rail, partridge, pheasant, heathcock, and powte. Carew's Survey.

HEATH-POINT, a cape of the south-east extremity of the island of Anticosti, in the Gulf of St. Lawrence.

---Seven miles north-north-west of Northampton.

HEATH-POUT, f. Young grouse.

Not heath-pout, or the rarer bird Which Phaës or Iona yields.

---More pleasing morfels would afford Than the fat olives of my fields. Dryden.
dained to alter the laws of heathenish religion, chosen they were, St. Paul excepted; the rest unchurched altogether, and unlettered men. Hooker.—Wild; savage; rapacious; cruel. That execrable Cromwell, made a heathenish or rather inhuman edit against the episcopal clergy, that they should neither preach, pray in public, baptize, marry, bury, nor teach school. South.

HEATHENISHLY, adv. After the manner of heathens.

HEATHENISHNESS, f. The disposition or manners of the heathen.

HEATHENISHLY, adv. After the manner of heathens.

HEATHENISHNESS, f. The disposition or manners of the heathen.

HEATHENISH, adj. Full of heath; commons of heath.

HEATING, f. The act of making hot.

To HEAVE, v. a. pret. heaved, anciently have; part. heaved, or hewn. To lift; to raise from the ground: so stretch'd out huge in length the arch-fiend lay, Tow'd Calais: grant him there: and there being seen, Left him at large. Milton.

To carry:

Now we bear the king Tow'd Calais: grant him there; and there being seen, Have him away, upon your winged thoughts, Athwart the sea. Shakespeare.

To raise; to lift:

I cannot have My heart into my mouth. Shakespeare. Save when he had his shield in my defence, And on his naked side receiv'd my wound. Dryden.

To cause to swell:

The glittering finny swarms That heave our friths and crowd upon our shores. Thomson.

To force up from the breast:

The wretched animal heaved forth such groans That their discharger did stretch his leathern coat; Almoft to bursting. Shakespeare.

To exalt; to elevate:

Poor shadow-painted queen; One heaved on high, to be hurl'd down below. Shakespeare.

To puff; to elate.—The Scots, heaved up into high hope of victory, took the English for foolish birds fallen into our net., forsook their hill, and marched into the plain. They, who adopted the first manner of spelling, derived the word from Cela, to "puff; to elate."—Ye shall offer a cake of the firft of your dough for an heave-offering, as ye do the heave-offering of the threshing-floor. Numbers.

HEAVEN, f. (from the Saxon word heapan, or peapan, or peopan, or peopan: for all these variations of the Saxon word occur. But in whatever form we take the Saxon word, it is in reality the passive participle of the verb heapan, or peapan, which signifies to Heave, or Lift up, or Elevate. The passive participle will in English be Heaven, or Heaped, or Elevated. So, by way of distinction and emphasis, the Saxons called the Region, which is above our Earth, Be peapan, or peopan, The Heaven, because it is elevated above all things and places terrestrial.)

The word, by which the Greeks expressed what we call Heaven, was well adapted to the idea of the thing signified. It was Orgos, the Greek word for a Boundary, and Aos, the Greek word for Above. So that Orgos implied, That Boundary or Limit of all things, which is highest above us. And this appellation was given sometimes to the Region of the Air from the Earth to the Clouds: and sometimes to the Region above the Clouds called Ethereal; or, The Region filled with Stars. For the etymology of the word, we have the authority of Aristotle himself, who in his book concerning "The World," expressly says, "We properly call it Orgos, from its being the Boundary of things above."

The Latins express the same, either by Caelum, spelt with ae, or Céleum, spelt with oé. Those, who adopted the first manner of spelling, derived the word from Cela, to "pothi, or embos, or itud," as though the "Heaven was embosbed, or fluided with stars." Pliny conceived this was the etymology of the word. Hodorus, Iulius Liphus, and Aldus Manutius, follow Pliny. Those interpreters, who spell the word with oe, derive Céleum from the Greek word Koános, which signifies Hollow or Conoscope, in which sense Virgil took the word, in his explication Céle Convexa, Bn. iv. 451. "The Vault of Heaven." The manner of spelling with oe is the most classical, and should now be followed by accurate scholars. Neither Greeks nor Romans appear to have ideas concerning Heaven, more sublime than the conception of its being occupied alike by the Sun, Moon, Stars, and Conftellations, and their imaginary divinities. With those ideas, they speak of Heaven, sometimes fabulously, sometimes gravely.

One of the most ancient among Greek poets alligns to Earth the production of Heaven; Earth first an equal to herself in fame Brought forth, that covers all, the Starry Frame, The spacious Heaven. Hesiod's Thogony. Cooke's Translation, v. 206.

This Heaven is fabulously said to be supported by the head, neck, and shoulders, of Atlas. Thus Ovid, in Met. iv. 1 speaking of Atlas, has these words:

"Heaven, let us be firm unto it, let us remain in it."—Ver. 661.

"On him all Heaven hath refted with its stars." Again, B. vi. 175.

"Ethereum qui fort cervicibus acem."

"Who bears the ethereal pole upon his neck." In Virgil we read,

Apelem at intera arunda cernit
Atlantis duri, Caelum qui vortice satis.—Bn. iv. 247.

"Who supports Heaven with his head." Again,
HEAVEN.

Ptolemy, who was an Egyptian philosopher, and who was eminent for his skill in Mathematics and Astronomy about 138 years before the Christian Era, adopted that System, which has ever since been known by the name of the Ptolemaic System. According to this Principle, the Earth is the Centre of the Universe, above which is the Air, and Fire: then comes Mercury; then Venus; then the Sun; then Mars; then Jupiter; then Saturn; then the Firmament with Fixed Stars; then the Crystaline Orbs; lastly, the Caelum Empyreum, i. e. Heaven of Heavens. All these Bodies, each in its respective Orbit, were suppofed by Ptolemy to move round the Earth in twenty-four hours.

In the beginning of the Sixteenth Century of the Christian Era, Copernicus, who was a native of Thorn in the year 1473, introduced a new Philosophy respecting the Heavens and Heavenly Bodies. Improving on the hints suggested by Pythagoras, and proceeding on observations made by himself, Copernicus maintained that the Sun was the Centre of this our Planetary System, and that Mercury, Venus, the Earth with its Moon, Mars, Jupiter, Saturn, all move round the Sun, each in certain periods. Above all these, he conceived were the Fixed Stars in the Firmament.

Taking for their basis the Copernican System, subsequent philosophers have progressively unfolded more magnificent ideas concerning The Heavens. As the Sun is the Centre of our Planetary System, they conceive each Fixed Star to be the Centre and the Sun of other Planetary Systems. So that the Heavens are the Region in which are contained Suns, Systems, and Worlds, innumerable. For this purpose, the Space of the Heavens must be innumerable. And when we consider, that the Universe is the work of Infinite Power, it is analogous to such Power, that the Space in which its energy is exerted should be without bounds or limits. How sublime a conception of Almighty God should arise in our minds, from contemplation of Innumerable Worlds existing through Infinite Space, and all directed in their respective courses with uniform regularity, need fearlessly be remarked to any one who thinks and feels as a Man living in the light of enlarged Philosophy and of Christian Religion. "An Undevout Philosopher is mad," says the excellent Author of Night-Thoughts, Dr. Young.

On Heaven, as connected with Revealed Religion, we shall speak what we collect from the Scriptures of the Old and New Testament.

In the Old Testament, the word "Heaven" is used to denote, sometimes the Region above us, in which Birds fly, and from which Dews and Showers descant: being what we commonly call the Air, or Atmosphere. Sometimes the word "Heaven" means the Firmament in which the Sun, Moon, and Stars, are seen placed. But the inspired Lawgiver of the Jews entertained more lofty ideas of the Supreme Being, than to fix his habitation in either of these Heavens; and therefore he speaks of "The Heaven of Heavens," (Deut. x. 14.) i.e. the Regions above all other Heavens, as belonging to the Lord God.

St. Paul, in his Second Epistle to the Corinthians, makes mention of a "Third Heaven," (2 Cor. xii. 2.) taking for his basis the Ptolemaic System, that which he supposes the admirable order and incredible regularity by which Heavens, Bodies are governed! In the beginning of the Sixteenth Century of the Christian Era, introduced a new Philosophy respecting the Heavens and Heavenly Bodies, above which is the Air, and Fire: then comes Mercury; then Venus; then the Sun; then Mars; then Jupiter; then Saturn; then the Firmament with Fixed Stars; then the Crystaline Orbs; lastly, the Caelum Empyreum, i. e. Heaven of Heavens. All these Bodies, each in its respective Orbit, were supposed by Ptolemy to move round the Earth in twenty-four hours.

vey, but laboured for language adequate to convey, their ideas of the unspeakable eminence and distance, at which The Almighty and His Exalted Son are removed above every thing visible or conceivable by the eye, palate, or mind, of Man.

And now, if we combine what has hitherto been said, we may define Heaven to be, "that Region above and around our Material System, which being not Solid, but being in Expansion and Extension Immeasurable, contains the whole of our Planetary System, and other similar Planetary Systems, without number." We may add, moreover, "that in a part raised above all Systems, and at a distance inconceivable and incomprehensible by Man, The Supreme Being, in Light glorious and inaccessible, doth in a more conplicious manner manifest the ineffuence of Deity; and the term Heaven is given emphatically, to that part of the Region where such effuence is manifested."

To Heaven, as the residence of the Almighty, Christianity directs the thoughts of our hearts. It is the seat of Infinite Perfection; we are taught therefore to purify our nature, if we would enter "Heaven." It is the abode of Happiness; we are animated under all circumstances of distress and affliction, our nature to Heaven;" since there, and there only, we shall find that peace to our Souls, which no sorrow shall interrupt, no care disturb, no alloy diminish. It is a Mansion durable; "Heaven" therefore is pointed out to us as our Real Home, towards which we are now but travelling, as pilgrims pressing on to the end of their journey.

Heaven, confidered under these various descriptions, is seen to be the object deserving the profoundest speculations of the Philosopher; and the most solemn and devout contemplations of every Christian.

Heaven in extent of Space is Immeasurable. As therefore it contains Innumerable Planetary Systems, it may by parity of reason be supposed capable of containing Innumerable Habitations for the Just and Good, God in his Influence is Unlimited and Infinite. As by his energy through the Universe He preserves all the Planetary Systems in their uniform courses, so by his Influence, or by some more visible demonstration of his Glory, He may occasion unspeakable happiness in all the Habitations of the Just and Good. Indeed the declarations of our Lord and his Apostles so strongly recommend to us to believe there are diversities of Habitation, into which as many states of felicity we shall hereafter enter, in proportion as we improve in moral and spiritual perfection. For, although in St. Luke xvii. 20 he says, "The kingdom of God is within you," yet he is there to be understood as speaking of the Kingdom to be established by Messiah within this World only. He meant to say, that as far as Messiah's Kingdom concerned this World, it was not to be a Kingdom like that of Earthly Monarchs, attended with pomp, power, and noise; it was to be of a spiritual nature, having dominion over the hearts, passions, and affections of Men, working inwardly and silently, though effectually and powerfully. But when in obedience to this his spiritual Kingdom Men had reformed their lives and improved their nature, then they were to expect an adequate retribution in Heaven; of which our Lord says, "In my Father's House are many Mansions." St. John xiv, 2. Our Lord uses the terms House and Mansions, in accommodation to the understanding of his hearers, that by visible objects they might form some, though imperfect idea, of objects invisible. The general purport of his words in this passage unhappily is, as Stilus, Lucas Brugensis, Clemens Alexandrinus, and Grotius, conceive, "That in a Diversity of Habitations referred for the Just and Good, different degrees of felicity will hereafter be appropriated."

From the universal persuasion that Heaven is the seat of transcendent excellence, hath arisen that usage among Poets, of applying either the word "Heaven" in compounds, or "Heavenly," when they would describe what is admirable. Hence in Mason:

Let not a partial faithfulness,
Let not a Mortal's vain command
Urge you to break the unbreakable laws
Of heaven-defended Charity.—Effida.

Whence can it rise, but from the sober power
Of Confinacy? She, heaven-born Queen,
Defends, &c.—Effida.

In Milton we read,

Likest to thee in shape and countenance bright,
Then shewing heavenly fair, &c.—Par. L. ii. 756.

Left that too heavenly form, &c.—Par. L. x. 872.

With a view to the same perfection; but with the additional consideration of the spirituality and eternity, which are attached to every Christian idea of "Heaven," Divines (for Instance, Tillotson, Stanhope, Stackhouse,) enforce Heavenly-Mindedness. By which assuredly they do not mean, that Enthusiastic Temper, which leads to a criminal neglect of relative, civil, and social Duties: but they certainly do mean and recommend, what by the affilience of The Holy Spirit, by prayer, by vigilance, by self-government, Thousands attain; viz. a Disposition of Mind, which shall feel God, Religion, and Virtue; Purity and Holiness, Justice, Charity, and Kindness; to be objects of desire, labour, and admiration, infinitely more worthy than most of those objects which engage the whole attention of the Worldly-Minded; which create such competition, confusion, and distraction, in Human Society; which, after all, are unsubstantial and transient, and in the very contempt of which there is a degree of wisdom and magnanimity.

Heaven, adj. Belonging to the heavens: heavenly. Much used in composition. As,

Heaven-born, adj. Descended from the celestial regions; native of heaven:

If I am heaven-begot, affect your fon
By some true sign.

Dryden.

Heaven-born filters! source of art!
Who charm the sense, or mend the heart;
Who lead fair virtue's train along,
Moral truth, and mystic song.
Pope.

Heaven-born, adj. Produced or cultivated in heaven.—Mush is the force of heaven-bred poetry. Shakespeare.

Heaven-built, adj. Built by the agency of gods:

Of sacred Troy, and raz'd her heaven-built wall.
Pope.

Heaven-directed, adj. Raised towards the sky.—Who taught that heaven-directed spire to rise?
Pope.

—Taught by the powers of heaven:

O sacred weapon! left for truth's defence;
To all but heaven-warring champions could be found
So hardly, as to prove or accept
Alone the dreadful voyage.

Heavenward, adv. [heaven and peepab, Sax.] Toward heaven:

I profane lay,
By various doubts impell'd, or to obey,
Or to object; at length, my mournful look
Heavenward erect, determin'd, thus I spoke. Prior.

Heaven-warring, adj. Warring against heaven:

None among the choice and prime
Of those heaven-warring champions could be found
Milton.
HEAVENLINES, s. Heavenly personage:
Goddes of women, fith your heavinesse.
Hath now vouehfaed itself to represent
To our dim eyes, &c. Davis on Dancing.

HEAVENLY, adj. Refembling heaven; supremely excellent:
Not Maro's mufe, who sung the mighty man;
Nor Pindar's heau'ny lyre, nor Horace when a fwan.

Celestial; inhabiting heaven:
Adoring firft the genius of the place,
Then earth, the mother of the heau'ny race. Dryden.

HEAVENLY, adv. In a manner refembling that of heaven:
In thefe deep folidities and awful cells,
Where heau'ny penive contemplation dwells,
And ever-mufing melancholy reigns,
Penfive contemplation dwells.

Where Prov.

word maketh it glad.

in the heart of man maketh it (loop; but a good

Wilkins.—Dejedtion of mind; deprefion of fpirit.—
of feveral bodies, or the proportion that is required be-

HEAVENLY, adj. With an air of d ejection:
I came hither to tranfport the tidings.

HEAVY, adj. [heau'y, Sax.] Weighty; ponderous;
tending strongly to the centre; contrary to light.—
Merfemus tells us, that a little child, with an engine
of an hundred double pulleys, might move this earth,
though it were much heavier than it is. Wilkins. Sor-
rowful; dejected; deprefsed.

Let me not be light;
For a light wife doth make a heavy husband. Shakespeare.

Grievous; opprefive; afflitive.—Menelaus bore an
heau'ny hand over the citizens, having a malicious mind.

Let not your ears defpife my tongue for ever,
Which shall poftefs them with the heaviest found
That ever yet they heard. Shakespeare.

Wanting alacrity; wanting briskness of appearance:
A heau'ny eyes, you fay, confefs
A heart to love and grief inclined.

Wanting spirit or rapidity of fentiment; unmanned.

A work was to be done, a heavy writer to be encouraged,
and accordingly many thousand copies were bifepoke.

Swift. Wanting activity; indolent; lazy:
Fair, tall, his limbs with due proportion join'd;
But of a heavy, dull, degenerate, mind. Dryden.

Drowiny; dull; torpid.—Peter and they that were with
him were heavy with sleep. Luke.—Slow; fluggifh:

But let thy fpiders that fuck up thy venom,
And heavy-gaited toads, lie in their way.

Dryden.

This heau'y-headed revel, exift and weft
Makes us traduced, and taxed of other nations. Shaksp.

Burdenfome; troublefome; tedious.—When alone, your
time will not lie heavy upon your hands for want of
fome trifling amufement. Swift.—Loaded; incumbered;
burthened.—Hearing that there were forces coming a-

Sethnic.—Noteafily digefted; not light to the ftomach.—

Burthenfome; troublefome; tedious.—When alone, your
time will not lie heavy upon your hands for want of
fome trifling amufement. Swift.—Loaded; incumbered;
burthened.—Hearing that there were forces coming a-

Sthetic.—Noteafily digefted; not light to the ftomach.—

Such preparations as retain the oil or fat, are most heavy
to the ftomach, which makes baked meat hard of di-
gestion. Arbuthnot.—Rich in foil; fertile; as, heavy lands.
Deep; cumberome; as, heavy roads.

HEAVY, adj. As an adverb it is only used in com-
position; heavy.—Your carriages were heavy laden;
they are a burden to the weary beaL 7& xvi. 1.—Confe
unto me, all ye that labour and are heavy laden, and I
will give you reft. Matth. xi. 28.

HEAVY-HANDED, adj. Having a heavy hand;
clumin about the hands.

HEAVY-HEELED, adj. Slow in motion; clumin-
about the legs.

HEBBERMEN, f. Fishermen, or poachers, below
London-bridge, who fish for ftithings, flounders, fmelts,
&c. commonly at ebbing water; mentioned in one of
the articles of the Thames jury, at the court of confer-
vance of the river Thames, printed anno 1632. These
persons are punifhable by lat. 4 Hen. VII. c. 15.

HEBBER, f. The privilege of claiming the
goods and trial of a thief within a certain liberty. Ag
old text.

HEBBING-WEARS, f. A device for catching fish in
ebbing water. Bailey.

HEBDOMAD, f. [hebobdoma, Lat.] A week; a space
of seven days.—Computing by the medical month, the
fird hebobmad or tertenary comitts of fix days seventeen
hours and a half. Brown.

HEBDOMADAL, or HEBDOMADARY, adj. [heb-
domus, Lat.] Weekly; confiting of seven days.—As for
hebdomad periods, or weeks, in regard of their fabbaths,
they were observed by the Hebrews. Brown.
HEBDOMADE, f. The hebdomad; a septenary; the space of seven days. Bailey.

HEBDOMADER, f. The hebdomadary. Scott.

HEBDOMADIUS, f. The week's-man, canon, or president, in the churches at Church, who had the care of the choir, and the offices belonging to it, for his own week. See the article EBDOMARY, vol. vi. p. 220.

HEBE, in mythology, a daughter of Jupiter and Juno. According to some, she was the daughter of Juno. According to others, she was the daughter of Jupiter and Juno. Bailey.

HEBE, or Hebe, the cup-bearer to all the gods. She was dismissed from her prebendary, in the cathedral church, who hath the care of the choir, and the officers belonging to it, for his own week. See the article EBDOMARY, vol. vi. p. 220.

HERDOMADE, f. The hebdomad; a septenary; the space of seven days. Bailey.

HEBEDJESU, a Syrian prelate of the Nestorian sect, who was made bishop of Sigara and Arabia, about the year 1285, and afterwards appointed archbishop of Nisibis, called by the Assyrians Soba. He died in 1318. He is recorded as the author of A Catalogue of Chaldean Ecclesiastical Writings, frequently referred to by oriental scholars, and in which is given a list of the books of Scripture which were generally received by the Syrian Christians in his time. Of this work Ecchellenius published an edition in 1633, with deviations from the original, for which he has been deservedly censured by the learned Dr. Joseph Asleman, physician and botanist, born at Neuftadt on the Orla, in 1703. In 1724 he was sent to Africa, at the command of Frederick-Augustus II, king of Poland. Having explored the neighbourhood of Tripoli and Tunis, travelled through the desert lying between those two towns, and examined the ruins of Carthage, he was obliged to return to the king's death in 1733. From this time he was brought into contact with many curious animals, with a fine collection of plants, herbs, shells, and other curiosities. The animals were placed in the museum at Dresden, and part of the curiosities were sent to the king's museum. He was afterwards patronised by Augustus III. in the same manner as he had been by his father the late king; and was now appointed professor of medicine at Leipzig, where he died in 1757. He is supposed to have been born 2443 years before Christ, and to have lived 464 years.

HEBERDEN (William), a physician of distinguished abilities, born at London in 1710. In 1724 he was sent to St. John's college, Cambridge; and, after a residence of...
HEBREWS, or EPISTLE TO THE HEBREWS, a canonical book of the New Testament; written by St. Paul. The Hebrews to whom this Epistle was addressed were the two chief sects of Palestine, that of Pharisees, who con-
vinced them, and by their means all the Jews conversed
whereof ever differed, of the insufficiency and abolished
of the ceremonial and ritual law.

HEBRIAN, f. [from Hebrew.] One skilful in Hebrew.

THE nature of the Hebrew verse, as the meaning
Hebrews, commonly called Jews. See the article Hebrew, and Jews.

HEBREWS, or EPISTLE TO THE HEBREWS, a

The Hebrews to whom this Epistle was addressed were the

Two chief sects of Palestine, that of Pharisees, who con-
vinced them, and by their means all the Jews conversed
whereof ever differed, of the insufficiency and abolished
of the ceremonial and ritual law.

HEBREWS, the defendants of Heber, commonly
called Jews. See the article Hebrew, and Jews.

HEBRIDES.

Argyle, with Mull, and the islands north of it, fell to the share of the first; Ilay, Caantere, and the southern isles, were the portion of the last; a division that formed the disaffection of the Sudereys and Norderays. These chieftains were the scourges of the kingdom; they were likened in history to the devastations of a tempest; their paths were marked with the most barbarous devastation. Encouraged by their dislike from the seat of royalty, and the presence of the time, which gave their marches full employ, they exercised a kingly power, and often assumed that title. They are known in history by the style of "the Lords of the Isles," or "the Earls of Rofs;" and sometimes by that of "the Macdonalds." Historians are silent about their proceedings, from the very time of the Danes, in the year 1066, till that of 1225, when John, lord of the isles, withdrew his allegiance. In the beginning of the next century, his successors were to independent, that our Henry IV. entered into a formal alliance with the brothers, Donald and John; which was to be included in it. But about the year 1476, Edward, from a change of politics, courted the alliance of James III. and dropped his new allies. James, determined to subdue this rebellious race, sent against them a powerful army under the earl of Athol, and took leave of him with this remarkable injunction: "Lay, with all your forces, and bring home many captives; which the family of Athol have used ever since for their motto. Rofs was submitted to a submilion; obtained his pardon, but was deprived of his earldom, which, by act of parliament, was then declared unalienably annexed to the crown; at the same time the king restored to him Knapdale and Caantyre, which the earl had resigned, and invested him anew with the lordship of the isles, to hold them of the king by service and relief.

In the fifth year of the great power of the isles was broken; yet, for a considerable time after, the petty chieftains were continually fomenting fresh rebellions, or harafling each other in private wars, while tyranny seems to have been multiplied. James V. found it necessary to make the campaign of the isles in person, in the year 1562, seized and brought away with him several of the most considerable leaders, and obliged them to find security for their own good behaviour, and that of their vassals. He examined the titles of their holdings, and, finding several to have been usurped, reunited their lands to the crown. On this occasion he had the glory of causing a survey to be taken of the coasts of Scotland and of the isles, by his pilot, Alexander Lindesay, the particulars of which were published in 1583, at Paris, by Nicholas Nicholay, geographer to the French monarch. The troubles that succeded the death of James occasioned a neglect of these inhabited parts of the Scottish dominions, and left them in a state of anarchy. In 1614, the Macdonalds made a formidable insurrection, opposing the royal grant of Caantyre to the earl of Argyle and his relations. The petty chieftains continued in a sort of rebellion, and the sword of the greater, as usual in weak governments, was employed against them; the encouragement and protection given by them to pirates, employed the forces of the Campbell during the reign of James VI. This prince, however, determined to keep the distant islanders more in check, by planting a colony amongst them. It appears that he drew from Fife, where the inhabitants were industrious in husbandry, and good fishermen, an efficient colony, headed by Sir James Anstruther and other gentlemen, which he planted on the isle of Lewis. Murdoch Macleod, a base-born but potent and ferocious chief, was at that time lord of Stornoway, a district where the new comers landed, and him they expelled, probably with inconsiderate haste. His people on shore submitted; but the active step, putting to sea with a bark peculiar to the Western isles, soon found an opportunity to surprise one of the colonial ships, which a calm had prevented from taking measures for flight or defence. The whole crew were hanged by the inhuman captor, except the bard of Balgonie, who was on-board; and he, after a rigorous confinement, was ransomed, and died at Orkney. Soon after Murdoch was seized by his own brother, Neil Macleod, who held him to the Scots, and he was hanged at St. Andrews's. The colony in the meantime was surrounded and harafled by the natives under a third brother, Norman Macleod; and, when most of the adventurers were slain or starved, the residue yielded themselves up to the infalute. Instead of avenging the insult, bought the freedom of the few survivors with a promise 'that the islanders of Lewis should remain unmolested savage.'

In this state, or in a very small remove from it, the inhabitants of this remotest part of the Hebrides appear still to remain; or at least under oppredion and cruel usage; and canons written on their state, and the islanders of Lewis; and whose interesting account of them we shall recite in his own words:

"Though several travellers have visited Skye, Mull, Ilay, and the other islands skirting the western shores of the main land, we have never yet had any written accounts of the Long Island, or rather chain of islands; or,
or, at least, any accounts relating to the domestic and political situation of the inhabitants. This, indeed, is at present most deplorable; the relief of emigration, offered to fome, being denied to the far greater number by extreme poverty; and a petty tyranny, arising from immemorial usages established in times of feudal oppression, added to their anguish and remote situation, feeks to keep the natives enslaved, people, from the benign influence of the British laws and government. A right avails nothing without a remedy. The poor Hebridean, as well as the Highland cottager in the more fequestered parts of North Britain, would find it impossible to escape, if he had courage to attempt, to escape the domination of the independent, petty lairds or landlords, who keep them in subjection. I say petty lairds and tackfmen; for, with regard to the great proprietors of land and sea-coal, in those parts, lord MacDonald, Mr. Humberstone Mackenzie, captain Macleod of Harris, Mr. Macdonald of Boisdale, and a few other gentlemen of large estates, they have given undeniable proofs of a disposition to protect the great body of the poor people against their immediate superiors and oppressors; by encouraging general industry, which cannot exist without liberty, or, in other words, without justice. But it too often, and indeed for the most part, happens, that non-refidence, and various other circumstances, prevent the part of the lord opportunities to the tackfmen, among whom their estates are divided, by leafhold, in large lots, or rather districts, to conceal the real state of affairs from the distant chief, and to enter into such combinations, as at once, in fact, frustrate the good intentions of those chiefs, and defy the free genius of the British constitution. The land is parcelled out in small portions, by the tackfmen, among the immediate cultivators of the soil, who pay their rent in kind, and in personal services. Though the tackfmen, for the most part, enjoy their leaves of whole districts on liberal terms, their exactations from the subtenants are in general most severe. They grant them their pollutions only from year to year; and, left they should forget their dependent condition, they are every year, at a certain term, with the most regular formality, warned to quit their tenements, and to go out of the bounds of the leafhold estate. The subtenant, by what presents he can command, or by humble supplications, endeavors to work on the mind of the tackfman, and, on his condition he pleases to retain for himself, his wife and children; for he has no other resource. And here I am to disclose to the English nation, as well, I hope, as the greater part of the Scotch, and to the whole world, a matter of fact, which cannot fail to excite a very general sympathy and concern for a sober, harmless, and most injured, people.

It is an invariable custom, and established by a kind of tacit compact among the tackfmen and inferior lairds, to refuse, with the most invincible obduracy, an asylum, on their ground, to any subtenant without the recommendation of his landlord. The wretched outcast, therefore, has no alternative, but to sink down into the state of a pauper, and to groan under the circumstances of the numerous chiefs of men known under the name of Scallags. The scallag, whether male or female, is a poor being, who, for mere subsistence, becomes a prey to the want of another, whether a subtenant, a tackman, or a laird. The scallag builds his own hut with fods and branches of trees; and, if he is fortunate enough to be possessed of a small patch of ground, on his tricks, and, by means of these, forms a new hut in another place. He is, however, in most places, encouraged by the possession of the walls of a hut, which he covers in the best way he can with his old tricks, flabbles, and fern. Five days in the week he works for his master, and he is allowed to retain a portion of the crops of land, on the edge of some moor; on which he raises a little kale, or cole-words, barley, and potatoes. These articles, boiled up together in one pot, and often without salt, are his only food; except in those seasons and days when he can catch some fish, which he is obliged not unfrequently to eat without bread or salt. The only bread he takes is a cake made of the flour of barley. He is allowed coarse shoes, with tartan hose, and a coarse coat, with a blanket or two, for clothing.

Although the Western Hebrides lie beyond the route pursued by the most distinguished travellers from the south, who have published accounts of their travels and voyages, (Mr. Pennant, Dr. Johnston, and captain Newe,) yet several gentlemen have visited most of those islands, with a view of acquiring such local knowledge as might enable them to employ the people in a filthy trade, or other industry; though most of them have never touched on the horrid island of Harris. But from want of time, and their not being able to converse with the common people, who know no other language than the Celtic, and who alone could or would point out their grievances in their native colours, the benevolent purpose of those gentlemen was, in a great measure, frustrated. The tackfmen, with whom they conversed, and their own factors, had an interest in concealing some truths, the knowledge of which might have equally benefited the independent freeholders, and the great body of the labouring people.

The writer of these notes, whose commission from the Society for propagating Christian Knowledge, from 1782 to 1791, gave him an opportunity of becoming acquainted with the actual situation of affairs in the Western Hebrides, truths, that he shall do no disservice, but on the contrary promote the interests of both the chiefs and the natives at large, by disclosing scenes industriously concealed from the eye of the benevolent landholder, as well as of the inquisitive stranger; in the hope that humanity and found policy may devise some means for alleviating the miseries, and converting, to both public and private advantage, the industry of a sober, ingenuous, but ill-treated, people. The picture, on the whole, is a grievous and melancholy one; and it is hoped that those legislators who fludder at the idea of human slavery, will exert their endeavours to relieve some thousands of their poor remote countrymen from lawless thraldom and tyranny, and not content themselves with searching for objects of benevolence in Africa.

The situation of the Hebrides in the North Atlantic Ocean, renders the air cold and moist; the principal part of them. In the most northern isles, the sun, at the summer solstice, is not above an hour under the horizon at midnight; and not longer above it at mid-day in the depth of winter. The soil of the Hebrides varies also in different isles, and in different parts of the same isle; some are mountainous and barren, producing little else than heath, wild myrtle, fern, and a little grass; while others, being cultivated and manured with seaweed, yield plentiful crops of oats and barley. Lead mines have been discovered in some of these islands, but not worked to much advantage; others have been found to contain quantities of marble, lime-stone, and iron-stone; for which they fell to their greatest advantage.

The commodities which may be deemed the staple of the Western Islands, are black cattle, sheep, and fish; for which they are well known. Part of the wool they work up into knit-ockings, coarse cloth, and that variegated stuff called tartan. They also
LIKEWISE fall mutton in the hide, and export it in boats or barklings to different parts of the main-land. Cod, herring, mackarel, whiting, haddock, and soles, are here caught in abundance, together with a small red cod, of a very delicate flavour. But the greatest treasure the ocean possesses is the prodigious quantity of herrings, which, at one season of the year, swarm in all the bays along the shores of the Hebrides. These are counted the largest, fattest, and finest, herrings caught in any part of the northern seas. The fishery employs a great number of people, and brings a considerable advantage to the kingdom.

The islands of these islands might easily be extended, so as to render them a staple of trade, and an excellent nursey for seamen. They are furnished with an infinite number of bays, creeks, and harbours, for the convenience of navigation; the inhabitants are numerous, and formed by nature for a maritime life; and such is the nautical situation, that the navigator is immediately in the open sea, and almost in the neighbourhood of Denmark, Sweden, Hamburg, Holland; nay, with a favourable wind, he can reach the coasts of France and Spain in a week's sailing; or if bound for America, or any part of the known globe, he is at once dimensioned of the land, and proceeds his voyage through the open ocean, without obstruction or difficulty.

Of the beautiful and sublime in nature;—of scenes at once grand, magnificent, and awful;—perhaps no part of the universe affords more striking examples than the Hebrides. They have been in part described by the able writers above-mentioned; but by none with more happy or elevated sentiments than Mrs. Murray, in her excursion to Staffa; the notices of the Boat-cave, Fingal's cave, the Clam, and the superb assemblage of basaltic pillars on that island, we shall give in her own words:

"On the north-west point, rises to a great height a small promontory almost perpendicular from the sea to its summit. The base of this promontory is rough and irregular for perhaps more than half its height, and, where the uneven rock ends, the most beautiful perfect uniform pillars rest upon it, in a convex semi-circle; and were it not for their stupendous appearance, it might be thought that the finest flatory ever existing had stretched ed its chisel powers beyond human art in forming them. Advancing from this beautiful convex circle of pillars, I observe huge rocks and caves, exhibiting the utmost variety; but, when I came within sight of the very regular pillars and elevated dome over the great caves, I was in an ecstasy.

"Conceive, if you can, an infinity of small pillars thrown together in every direction at a very consider able height from the eye, bearing the resemblance of arched architecture executed in the most masterly style, and highly beautified by various tints made by time and weather, composing an irregular and continued façade to magnificent domes, from which descend perpendicular, compact, smooth, prismatic pillars, some reeling (particularly those at the Boat-cave, Fingal's cave) on rough irregular found masses of basaltic rock washed by the sea; others mortified in the angles of flumps of pillars once entire, the uppermost joints of which have separated from the main masses of pillars forming the island.

"It is said that the Boat-cave is much larger than that of Fingal; but it is very little known, owing to ideal or real danger in going into it. The mouth of it is far from striking or beautiful; its form somewhat resembling a barn-door; but the dome or outside roof resting on the perpendicular prisms, with the symmetry of the pillars ranged in a compact form along that part of Staffa, are beyond all description beautiful, even more so, in my opinion, than those of the Boat-cave. But the striking coup-de-ceil of them is lost to all who approach Staffa by the south-east side of it; and it is not seen at all if the boatmen do not choose to be at the trouble of rowing to the west. I was almost overcome with astonishment and delight, on viewing the parts around the outside of the Boat-cave; and I remained in silent amazement at every succeeding object that met my eye, till I came to the entrance into Fingal's cave, which I did not perceive till I was nearly close to it, occasioned by a round or elevated dome, from the magnificent crown or dome of small pillars in every direction to a solid rough base of basaltites. The romantic grandeur of the scene is beyond all description. "When I came to what is called the Clam-shell cave, I was astonished by other pillars, more extraordinary, if possible, in point of variety, than those of Staffa had been before. They are the large bending pillars. I crossed the creek at the mouth of the cave, and sat down on huge convex prisms lying horizontally in a compact mass, and running a vast length into the sea. Opposite to where I sat, huge prisms curve in the arch of a circle down the side of the island, from the summit to the fumps near the mouth of the Clam-shell cave, forming a figure something resembing the ribbed inside of a scallop-shell, which I imagine has given the cave its name. These concave pillars exhibit at their angles, joints exactly similar to the perpendicular ones at Fingal's cave, and form a scene more sublime than I am able to describe. I advanced without obstruction or difficulty.

The commerce of these islands might eaily be extended, so as to render them a staple of trade, and an excellent nursey for seamen. They are furnished with an infinite number of bays, creeks, and harbours, for the convenience of navigation; the inhabitants are numerous, and formed by nature for a maritime life; and such is the nautical situation, that the navigator is immediately in the open sea, and almost in the neighbourhood of Denmark, Sweden, Hamburg, Holland; nay, with a favourable wind, he can reach the coasts of France and Spain in a week's sailing; or if bound for America, or any part of the known globe, he is at once dimensioned of the land, and proceeds his voyage through the open ocean, without obstruction or difficulty.

The ifland of Hyona, or Iona, has been celebrated by many authors as the venerable and primitive seat of Scotch literature and religion, founded by St. Colum. The ruins of the sacred edifice, it affords us a panorama view of the surrounding islands, and an expanse of the Atlantic towards America, as far as the eye can reach.

The island of Hyona, or Iona, has been celebrated by many authors as the venerable and primitive seat of Scotch literature and religion, founded by St. Columba, in the sixth century. The ruins of the sacred edifice, it affords us a panorama view of the surrounding islands, and an expanse of the Atlantic towards America, as far as the eye can reach.
Marathon, or whose piety would not grow warmer among the ruins of Iona."

HEBRIDES. See New Hebrides.

HEBRON, or Kirjath-Abba, or Arba, in ancient geography, a city of Palestine, belonging to the tribe of Judah; situated upon the borders of Hebron, that province. It was one of the cities of the Levites of the family of Kohath, (though the fields and other dependencies were given to Caleb son of Jephunneh for his inheritance) and was also one of the six cities of refuge. This city appears to have been of great antiquity, being built seven years before Zoan or Tanis in Egypt; and was the residence of the patriarch Abraham, who built an altar here. The original name of this place was Kirjath-arba, or Arba, i.e. the city of Arba, a great man among the Anakims, who dwelt here previous to the conquest of Canaan by Israel, and who probably founded this city. It afterwards became the seat of one of the Canaanitish kings, the last of which, named Hoham, fell at the taking of this place by Joshua. Here David commenced his reign, and having reigned seven years and six months over Judah, the elders of the remaining tribes assembled here for the purpose of appointing him king over Israel at large. Here Abner fell by the treacherous hands of Joab, and here he was buried; David attended his obsequies. As Jerusalen after the destruction of the capital of the kingdom, Hebron appears to have gradually declined, for we find nothing more concerning it, until the Maccabean wars; when the enemies of Judas Maccabaeus having sheltered themselves here, he totally destroyed the city and fortress, and thus rendered it of no further consequence. Gen. xiii. 18. Numb. xiii. 22. Josh. ii. 2, 36. xiv. 15. xv. 24. xxii. 10–13. 1 Sam. xi. 4–11. iii. 17. &c. 1 Mach. vi. 45. It is now called Hebron.

The Christians have a church here, which they say contains the tombs of Abraham and Sarah, to which the Mahometans, as well as Chriftians, come in pilgrimage. The plain of Mamre is not far from Hebron; it is fertile, and planted with excellent vineyards. Conflantine built a church here, the walls of which are yet in existence: eight leagues south-west of Jerusalen.

HEBRON, in ancient geography, a city of Palestine, belonging to the tribe of Abar, situated upon the borders of Hebron, that province. Josh. xix. 28.

HEBRON, a town of the American States, in Cumberland county, Maine, situated on the north-east side of the Kennebec, and founded in 1792. It is thirty-five miles north-by-west of Portland.

HEBRON, a township of the American States, in Washington county, New York, containing 1703 inhabitants.

HEBRON, a town of the American States, in Tolland county, Connecticut, settled in 1704 from Northampton. Most of the lands were given by Joshua Sachem of the Mohrgan tribe, in his last will and testament. It lies between Lebanon and Glastonbury, about eighteen miles south-east of Hartford, and sixteen south of Tolland.

HEBRON, a Moravian settlement in Pennsylvania, sixteen miles from Lititz, which is seventy miles northly of Philadelphia. This village was established in 1757.

HEBRONITE, n. A descendant of Hebron, an inhabitant of Hebron.

HEBRUS, in ancient geography, the largest river of Thrace, rising from mount Scrombus, and running in two channels till it reaches Philippopolis, where they unite. It empties itself at two mouths into the Aegean sea, to the north of Samos and Naxus. It was supposed to roll its waters upon golden sands. The head of Orpheus was thrown into it after it had been cut off by the Ciconian women. Meta.

HEB'TICH, a town of Germany, in the circle of the Upper Rhine, and county of Spanheim; two miles south-east of Trierbach.

HEBUDES. See Hebrides.

HECATE, or the name of a nymph, a huntress.

HE'CATE, in ancient geography, a town of Attica.

HECAL'TISIA, a festival in honour of Jupiter of Hecele, instituted by Thebeus, or in commemoration of the kindred of Hecele, whom Thebeus had experienced when he went against the bull of Marathon, &c.

HECAM'EDA, a woman's name, daughter of Arbas.

HECATE'US, an historian of Miletus, born 549 years before Christ, in the reign of Darius Hystaphes. He was a geographer.

HEC'A'TE, in mythology, a daughter of Perseus and Afteria, the same as Proserpine or Diana. She was called Luna in heaven, Diana on earth, and Hecate or Proserpine in hell; whence her name of Triune, terrina, tricepts. She was supposed to prelude over magic and enchantments; and was generally represented like a woman, with the head of a horse, a dog, or a boar; and sometimes she appeared with three different bodies, and three different faces; with one neck. Dogs, lambs, and horses, were generally offered to her, especially in high-ways and cross-roads; whence the name of Triune. She was placed in the high-ways, it is said, to induce her to avert any evils on account of pious crimes committed on the public roads. When Judas Maccabaeus had fled to the mountains of that province, it was supposed to extend over the heavens, the earth, the sea, and hell; and to her kings and nations supplicated themselves indebted for their prosperity. Pasifamus, Profior Vofh's has endeavoured to trace the origin of this goddess, which he finds first in Thrace; to show the probable cause of the great variety of attributes beffowed on her, and to reduce them to some sort of unity. He adopts it as a principle, the truth of which is confirmed by the history of Hecate, whose image Pasifamus found still in a similar shape at Ägina, where all deviations from the noble figure of man, in the representation of deities, were their origin to later myftics and artists; and he considers it as singular that the triple goddess has never been transformed into one multiplied by the fixed number seven or nine, or even by a hundred; that though the name of Hecate is often used for Selene, Artemis, and Persephone, or Proserpine, we never find a triple Selene, or Persephone, but often a three-headed Artemis, mentioned; and that frequently, by the side of Hecate, a three-headed Artemis is introduced. The festival of Hecate is celebrated by the Stratoniceans in honour of Hecate. The Athenians paid also particular worship to this goddess, who was deemed the patroness of their families and of children. From this circumstance the statues of the goddesses were erected before the doors of the houses; and upon every new moon a public supper was always provided at the expense of the richest people, and let in the streets where the poorest of the citizens were permitted to retire and feast upon it, while they reported that Hecate had vowed it. There were also expiatory offerings, to supplicate the goddess to remove whatever evils might impend on the head of the public. Plutarch.

HECATOMB, f. In antiquity, a sacrifice of a hundred head of the same kind, at the time of the holiday, and by an hundred priests or sacrificers. The word is formed of the Greek deixtome, which denotes a magnificent sacrifice. Concerning the origin of hecatombs Strabo relates, that there were one hundred cities in Laconia, and that each city used to sacrifice a bullock every year for the common safety of the country. Others refer the origin to a plague, wherewith the one hundred cities of Peloponnesus were afflicted; for the removal whereof, they jointly contributed to send a splendid sacrifice. Julius Caesar relates, that for a hecatombe they erected one hundred altars of turf, and on these sacrificers one hundred sheep and one hundred hogs. He adds, that when the emperors offered sacrificers of this kind, they were called...
acrificed one hundred lions, one hundred eagles, and one hundred other beasts of the like kind.

HECATOMBÆON, the first month of the Athenian year, consisting of thirty days; beginning on the first new moon after the summer solstice, and consequently answering the 8th distributed among the poor citizens. There were also public games first instituted by Archimedes of Argos, in which the prize was a shield of brass with a crown of myrtle.

HECATOMPHONIA, a solemn sacrifice offered by the Maccabees to Jupiter when any of them had killed an armed enemy.

HECATOMPOLIS, an epitaph given to Crete, from the hundred cities which it once contained.

HECATOMPYLOS, in ancient geography, the metropolis of Parthia, and royal residence of Arsaces, situated at the springs of the Araxes. Thebes in Egypt had also the same name from its hundred gates.

HECATONNE/SI, in ancient geography, small islands between Asia and Africa.

HECHINGEN, a town of Germany, in the circle of Swabia, which gives name to a branch of the family of Hohenzollern, and is the residence of the prince: thirty miles south of Stuttgart, and fifty-two east-south-east of Strasburg.

HECHT (Christian), a German Protestant divine, born at Halle, in Saxony, about the year 1696. He became minister of Esen in East-Friesland, where he died in 1748, leaving behind him various works of considerable reputation. Among these are, 1. Commentatio Philologico-Critico-Exegetica, de Sella Scribarum. 2. Antiquitates Haraeorum inter Judaeos in Polonia & Turrici Imp. Regionibus floretis Solis, &c. and numerous treatises in the German language.

HECHT (Godfrey), a learned German writer, born at Juterbach, in the latter part of the seventeenth century. He received his academic education at the university of Wittemberg. In 1711, he was appointed rector of the college at Lucca, in Lower Lusatia, where he died in 1748, leaving behind him various works of considerable reputation. Among these are, 1. Commentatio Philologico-Critico-Exegetica, de Sella Scribarum. 2. Antiquitates Haraeorum inter Judaeos in Polonia & Turrici Imp. Regionibus floretis Solis, &c. and numerous treatises in the German language.

HEC (from the name of HeElor, \( \text{Hec'tic} \)), or \( \text{Hec'tical} \), adj. [helique, Fr. from \( \text{Hec'tie} \), Gr.] Habitual; constitutional.

A hellic fever hath got hold

Of the whole subsistence, not to be controul'd. 

Dune.

Troubled with a morbid heat.—No hellic student fears

The gentle maid. 

Taylor.

HECTIC, f. An hellic fever.

Like the hellie in my blood he rages,

And thou must cure me. 

Shakespeare.

HECTOR, the son of King Priam and Hecuba, celebrated as the most valiant of all the Trojan chiefs that fought against the Greeks. He married Andromache the daughter of Priam, by whom he had Aeneas. He was appointed captain of all the Trojan forces when Troy was besieged by the Greeks; and the valor with which he behaved showed how well qualified he was to discharge that important office. He engaged with the bravest of the Greeks, and according to Hyginus, no less than thirty-one of the most valiant of the enemy perished by his hand. When Achilles had driven back the Trojans toward the city, Hector, too brave to fly, waited the approach of his enemy near the Scæan gates, though his father and mother blamed his rashness, and entreated him to retire. The fight of Achilles terrified him, and he fled before him in the plain. The Greek purified, and Hector was killed, and his body was dragged in cruel triumph by the conqueror round the tomb of Patroclus where Hector had lain. The body, which had received the groffest insult, was ransomed by Priam, and the Trojans obtained from the Greeks a truce of some days to pay the lait offices to the greatest of their leaders. The Thébans boasted in the age of the geographer Pausanias that they had the ashes of Hector preserved in an urn, by order of an oracle, which promised them unfidurb'd victory, if they were to call him s Telèus or Telèor. The epithet of \( \text{Hel'tor} \) is applied by the poets to the Trojans, as beav expressive of valour and intrepidity.

HECTOR, f. [from the name of HeElor, the great warrior.] A bully; a blustering, turbulent, perversious.
and drink to this celestial herc.

Prior.  

To HECTOR, u. a. To threaten; to treat with infolent authoritative terms:

The weak low spirit Fortune makes her slave.

But she's a drudge, when herc'd by the brave. Dryden.

To HECTOR, u. a. To play the bully; to bluster.

One would think the herc'ring, the formimg, the fullen, and all the different species of the angry, should be cured. Spætator.

Don Carlos made her chief director, That she might o'er the servants herc. Swift.

HECTOR, a military township of the American States, in the State of New York, on the east side of Seneca Lake, towards the fourth end, having Ovid on the north and Newtown township on the fourth : twenty-nine miles south-west of the ferry on Cayuga Lake.

HERCUBING, f. The act of threatening; the conduct of a bully.

HECUBA, daughter of Dymas, a Phrygian prince, or, according to others, of Ciffes, a Thracian king, was the second wife of Priam king of Troy, celebrated as the chastest of women, and the most tender and unfortunate of mothers. When she was pregnant of Paris, she dreamed that she had brought into the world a burning torch which had reduced her husband's palace and all Troy to ashes. So alarming a dream was explained by the footsayers, who declared that the son she should bring into the world would prove the ruin of his country. When Paris was born, she exposed him on mount Ida, to avert the calamities which threatened her family. Paris was brought up by the shepherds, to whom he was fruitfully and the prediction of the footsayers was fulfilled. During the Trojan war she saw the greatest part of her children perish by the hands of the enemy, and like a mother she confessed her grief by her tears and lamentations, particularly at the death of Hector her eldest son. When Troy was taken, Hecuba, as one of the captives, fell to the lot of Ulysses, a man whom she hated for his perfidy and avarice, and she embarked with the conquerors for Greece. The Greeks landed in the Thracian Chersonesus to load with fresh honours the grave of Achilles. During their stay the hero's ghost appeared to them, and demanded, to endure the safety of their return, the sacrifice of Polyxena, Hecuba's daughter. They complied, and the head of Polyxena was torrid by her mother to be sacrificed. Hecuba was inconsolable, and her grief was still more increased at the sight of the body of her son Polydorus washed on the shore, who had been recommended by his father to the care and humanity of Ponymetor king of the country. She determined to revenge the death of her son, and with the greatest indignation went to the house of his murderers, tore out his eyes, and attempted to deprive him of his life. She was hindered from executing her bloody purpose, by the arrival of some Thracians, and she fled with the female companions of her captivity. She was purified, and when she ran after the fones that were thrown at her she found herself suddenly changed into a bitch, and when she attempted to speak found that she could only bark. After this metamorphosis she threw herself into the sea, according to Hyginus; and that place was, from that circumstance, called Gynenus. Hecuba had a great number of children by Priam, among whom were Hector, Paris, Deiphobus, Panion, Helenus, Polites, Antiphon, Hippolitus, Leucippos, Phorbas, and among the daughters, Creusa, Ilione, Laodice, Polyxena, and Cassandra. Ovid. Virgil.

HED, a town of Sweden, in the province of Weftmannaland: eighteen miles north-west of Stremholm.

HEDA, f. In old records, a haven, a port.

HEDAGIUM, f. In old records, wharfage, a custom or tribute paid at a wharf.

HEADING, or Store Hedding, a town of Denmark, in the island of Zealand: twenty miles south-west of Copenhagen.

HED, a town of Sweden, in the province of Weftmannaland: thirty-two miles north-west of Uddevalla.

HEDER, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of Rennes: two posts and a half north of Rennes, and five and a half south of St. Maloos. Lat. 48° 18'. N. lon. 14° 42'. E. Ferro.

HEDIMOIRA, a town of Sweden, in the province of Dalecarlia, and one of the principal towns of the kingdom, situated near a lake, well built and commercial; here is a large manufacture of gunpowder: fifty-three miles north-west of Ufpal. Lat. 60° 17'. N. lon. 16° E. Greenwich.

HEDENG (John-Reinhard), a learned German Lutheran divine, born at Stuttgard in 1684. He accompanied two princes of Wirtenberg on their travels, in the capacity of chaplain, and on his return to his country was appointed professor of civil and canon law in the university of Gießen. Afterwards he was nominated preacher to the court, and consitatorial counsellor. He died in 1764. He was the author of Critical Remarks on the Psalms, and on the New Testament; and editor of an impression of The Bible, with corrections of the version in common use.

HEDERA, f. [from ende, Lat. eat, because it waftes and devours trees; or from herendo, to flick.] Ivy.

In botany, a genus of the class pentandria, order monogynia, natural order of hederaceae, (caprifolia, jul.) The generic characters are—Calyx: involucro of a simple umbel, very small, many-toothed; perianthium very small, five-toothed, furious. Petals five, oblong, spreading, with the tips bowed inwards. Stamina: filaments five, tubulate, upright, of the same length with the corolla; antherae trifid at the base, incumbent. Pistillum: germ turbinate, surrounded by the receptacle; style simple, very short; stigma simple. Pericarpium: berry globose, onecelled, fivecelled, (fivecelled, Gertner.) Seeds: five, large, gibbous on one side, angular on the other. Efsetial Character. Petals five, oblong; berry five-seeded, surrounded by the calyx.

Species. 1. Hedera helix, or common ivy: leaves ovate and lobed. The varieties are:—f. Hedera poetica, with leaves ovate, undivided. 7. Hedera major ferrilis, with leaves five-lobed. 8. Hedera humi repens, with leaves lanceolate.

Common jy is a well-known parasitical shrub. Where it meets with any support, such as walls, buildings, or trees, the stem will adhere to them, and rie to a very great height, infinuating itself by a great abundance of fibres into the joints of walls, or the bark of trees. If no support is near, the flarks trail upon the ground, taking root with their whole length, so that they cover the surface close ly, and are difficult to eradicate; for where any small parts of the flarks are left, they will soon spread and multiply. Whilst ivy is fixed to any support, or trails upon the ground, the flarks are fonder and flexible; but when it has reached to the top of its support, they shorten and become woody, forming themselves into large bulky heads; their leaves are larger, more of an oval shape, and not divided into lobes like the lower leaves: this difference occasioned the old botanists to take them for different species. Whilst the flarks trail, ivy does not produce any flowers; and in this state it is called beard or creeping ivy; but when the branches get above their support, they produce flowers at the end of every floor; these are successeed by berries, formed into round bunches called by the ancients corymbi, and turning black before they are ripe. In this state it is called climbing or berried ivy.
The trunk in old trees is covered with a ash-coloured chopped bark; in the young branches it is of a green or purple colour. Leaves alternate, evergreen, glossy, smooth; while the plant creeps, three-lobed or sometimes five-lobed; but, when it quits its support, ovate; they are sometimes tinctured with red, sometimes painted with white veins, particularly in the young branches. The flowers are yellowish, or greenish white, in a very close thick umbel, at the extremities of the twigs. The berry is placed below the receptacle of the flower, and is crowned with the five-cornered streaked rudiment of it; at first it is succulent, with a purple juice; afterwards it becomes coriaceous, dry, and very obscurely quinquangular. The five cells are invested by their proper filthy-white membrane; the partitions are very thin, one or more frequently obliterated when the berry is in a state of maturity. The seeds are wrinkled and yellowish.

It is found wild all over Europe; but Linnaeus says it is by no means common in Sweden. Kalm remarks, that he never saw the common ivy in North America, except once against a lone building, and this was apparent from Europe; he planted the plant, and it spread upwards, leafy, terminated by flowers. Leaves scattered, more crowded towards the tops of the branches, on foot-stalks, wide, spreading, pointed, waved on the margin, very smooth, obscurely three-nerved, veiny, bright green. Jacquin, the first discoverer, long ago, said it proper to the genus Heder, or ivy, and it was so admitted in the collection of Aralia. This fine plant was discovered in the woods of Martinique, by professor Jacquin, and in Jamaica by Dr. William Wright and Mr. Francis Maffon. In the catalogue of the royal garden at Kew, it is said to have been introduced in 1778, by Mr. William Forbush; but it has not been noticed in the collection of the late marquis of Rockingham long before the year 1793. It is said to have flowered for the first time in Europe in the flower of the marchioness in 1787.

3. Hedera quinquefolia, or five-leaved ivy: leaves elliptical, entire; racemes compound, terminating; flowers yellow, in little heads. Stem arboresecent, eight points high in the above, erect, cylindrical, abruptly branch.

In the latter part of the 17th century, when it was the fashion to fill gardens with all sorts of evergreens, many of these plants were trained into round heads, clipped into globes, cones, &c. and being so hardy as not to be injured by weather, and growing in any soil, were then much esteemed; since this taste has been exploded, the ivy is seldom admitted into gardens, unless to cover walls, or run over ruins, &c. for which purposes no plant is so well adapted. Mr. Curtis, however, observes, that few people are acquainted with the beauty of ivy when suffered to run up a flat wall at length, to form itself into a flagged, the singular complication of its branches, and the vivid hue of its leaves, give it one of the first places amongst evergreens in a shrubbery. In woods, when suffered to grow large and rampant, this plant, by twining round the bodies of timber-trees, does them great damage, and therefore should be carefully destroyed, as it may easily be, by cutting any where through its trunk. But in ornamental out-lets, where evergreens do not abound, a few trees covered with ivy have a very pleasing effect; and induce birds of song to haunt those thickets for the sake of the berries and haller. Ilyr also produces very picturesque effects in large masses of ruined buildings. Linnaeus affirms, that it does no injury to buildings; but that can scarcely be admitted, when we consider that it must harbour wet and filth, and that the branches will make their way into any suffure or defect in the wall, and enlarge it.

Besides the varieties enumerated above, which arise merely from age and situation, there are two that may be found in the nurseries; one with five-lobed leaves, and the other with yellowish leaves on the top of the branches.

2. Hedera capitate, or cluster-flowered ivy: leaves elliptical, entire; racemes compound, terminating; flowers yellow, in little heads. Stem arboresecent, eight feet high in the above, erect, cylindrical, abruptly branch.
Into thy promise; for thy life preserved,
When I was hasty, thou delay'dst me longer:
in some business of your own.
—When you are sent on an errand,
I pray thee, let me hedge one moment more
Into thy promise; for thy life pretend'd.

To HEDGE, v. n. To shift; to hide the head.—I myself, sometimes hiding mine honour in my necessity, am fain to shuffle, to hedge, and to lurch. Shakespeare.

HEDGE-BORN, adj. Of no known birth; meanly born:
He then, that is not furnish'd in this sort,
Doth but usurp the sacred name of knight,
And should, if I were wise, be call'd a hedge;
Be quite degraded, like a hedge-born swain.
That doth presume to boast of gentle blood. Shakespeare.

HEDGE-BOTHE, f. Stuff necessary to make hedges; which the leafe for years, &c. may of common right take in his ground leaved.

HEDGE-BREAKER, f. By flat. 43 Eliz. c. 7, those who are detected in breaking hedges shall pay such damages as a justice of the peace shall think fit; and, if not able to pay the damages, shall be committed to the common-fence to be whipped. And by flat. 15 Car. II. c. 8, confables, and others, may apprehend persons suspected of hedge-breaking, and carry them before a justice; where not giving a good account how they came by wood, &c. they are not only to make such recompence as the justice of peace shall advise, but pay a sum not exceeding ten shillings for the life of the poor, or be sent to the house of correction for a month; persons convicted of buying stolen wood, shall forfeit treble value to him from whom taken.

HEDGE-CREEPER, f. One that skulks under hedges for bad purposes.

HEDGE-HOG, f. An animal set with prickles, very familiar, but on a smaller scale, to those of the porcupine. For its natural history and species, see the article ERINACEUS, vol. vi. p. 902, and the correspondent Engraving.

HEDGE-HYSSOP, f. in botany. See GRATiola.

HEDGE-MUSTARD, f. in botany. See SYZYGMUS and ERYXHUM.

HEDGE-NET'TLE, f. in botany. See Galeopsis.

HEDGE-NOTE, f. A word of contempt for low-writers. When they began to be somewhat better bred, they left their hedge-notes for another sort of poem, which was also full of pleasant ranterly. Dryden.

HEDGE-PIG, f. A young hedge-hog:
Thrice the brinded cat hath mew'd,
Thrice and once the hedge-pig whin'd. Shakespeare.

HEDGE-ROW, f. The series of trees or bushes planted for inclosures:
Sometime walking not unseen
By hedge-row elms on hillocks green. Milton.

HEDGE-SPARROW, f. A sparrow that lives in bushes. See the article MOTACILLA.

The hedge-sparrow fed the cuckoo so long,
That it had its head bit off by its young. Sidney.

HEDGE/ER, f. One who makes hedges.—He would be laughed at, that should go about to make a fine dancer out of a country hedger at past fifty. Locke.

HEDGING, f. The act of making hedges; the fences.

HEDGING-BILL, f. A cutting hook used in making hedges; the name with HAND-BILL.—Here comes master Danitas with a hedging-bill in his hand. Shakespeare.

HEDJAS, a considerable province of Arabia, bounded on the east by Nejed, on the north by the defert of Sinai, on the south by Yemen, and on the west by the Arabian Gulf. It contains the cities of Mecca, Medina, and Taif, with many other considerable towns and villages. On the coast are several good harbours; and in the interior is a range of elevated ground called the Highlands; which produce abundance of fruits, and other commodities of various kinds. The celebrated balm of Mecca comes from these lofty regions, but chiefly from the extensive mountain called Sofra, which is three days' journey from the Arabian Gulf.
HE'DIC, a small island in the Atlantic, about five leagues from the coast of France, chiefly inhabited by fishermen; it contains a town of the same name, and a fort called Pengarde: two leagues and a half east of Belle-Ille. Lat. 47° 23'. N. long. 42°. E. Ferro.

HE'DINGHAM CASTLE, a market town in the county of Suffolk, about eighty miles from London by land, forty-eight miles from Sudbury, and four fromHalfted; it is pleasantly situated, and has many respectable inhabitants. There is no particular manufactory carried on, but the growth of hops is very considerable, as its situation for that purpose seems preferable to any other place in the county of Essex. The castle was founded by Aubrey de Vere, about the time he built the castle at Sopwell, by whose grantall the advowson of the church of St. Mary, in the town, is vested in the abbey of Westminster. It was surrendered to the king in the reign of William the Conqueror, anno 1066.

A priory was also founded in this place for black-veiled nuns of the Benedictine order, by Lucia de Vere, which in the latter end of the fifteenth century. He purfued his aca demical studies at Friburg, in the Brifgaw, where he was created doctor of divinity in 1520. At that time Luther's opinions were rapidly spreading in Germany, and were embraced by Hedio. Being afterwards appointed preacher at the principal church in Mentz, he gave offence to some of his hearers by the freedom of his opinions; and drew from them the persecution of the monks, by boldly exposing their abuses. These circumstances occasioned his withdrawing from Mentz, in 1523, and retiring to Strafburg, where he became an able coadjutor to Wolfgang Capito and Martin Bucer, in propagating the doctrines of the reformation. He next paid a visit to Venice; and thence proceeded through Germany to Copenhaghen, and then returned to Stockholm. He now struck several medals relating to the Swedish commerce, manufactu res, and mines, with a chronological series of the Swedish kings. The empress of Russia having requested the queen of Sweden to permit him to come to Pet erburgh, he went thither in 1755; and, having struck an excellent likeness of her imperial majesty, he returned, at the end of two years, loaded with favours. After passing some years partly in Swiflerland, and partly at Berlin and Stockholm, he finally settled in his own country about the beginning of 1746. In 1748 he went to Nuremberg to execute the medals distributed as prizes by the academy of Berlin, for which he received first impressions of each in gold, and was elected a member. He laboured to the very last with unimpaired faculties; a proof of which is, his medals of George II. the em press queen, and Charles XII. of Sweden, executed in the same year; and, besides his ordinary business, he is engaged in the execution of other medals of medals to commemorate the principal events in the history of Switzerland; but this undertaking was beyond the compass of his life. He died at Schweiz of a fit of apoplexy in 1771, at the age of eighty. All his medals were engraved and published in Swiflerland by M. Mecheln, under the title of Euvres de Chevalier Hedinger, &c. Basel, 1776, folio; to which is prefixed, an account of his life. A catalogue raisonne of his medals may be seen in the third volume of I. C. Fuefelin's History of the Helvetic Artists.
Hedwigia dulg'd his ardour for botanical pursuits as much as his other avocations permitted. He was most earnest in his enquiries into the internal structure of vegetables; and in these researches he made a wonderful progress. He had the good fortune to receive from Kocher, of Dresden, an exact account of the corolla, incumbent, in the calyx, of which, to the minutest parts, he became extremely skilful. He also, at the age of forty, taught himself to draw and paint the objects which he discovered. In January, 1770, he had the satisfaction of seeing a capsule of the brumum pulvinum burst and yield its pollen, by which he ascertained the male organ of this genus. His early love for botany was already kindled by frequent experiments, and those of others, that the little heads called by Linneus anteria, were the seed-veils of the mofles. On these grounds he examined and described the fructification of all the mofles which fell in his way; and, in 1778, he published an account in the Leipzig Miscellany of Physics and Natural History. Having removed to Leipzig in 1781, he there published his capital work, Fundamentum Historiae Naturalis Mycorum Frondosorum, 4to. Parts I. 1783; II. 1785. He next obtained the prize offered by the Petersburg academy, for the detection of the flowers of the cryptogamous plants, by a dissertation entitled, Theoria Generationis & Fructificationis, &c. He also, at the age of forty, taught ordinary professor of medicine in the university; and in 1789 was made professor of botany, with the superintendence of the physic garden. In this appropriate situation he continued to cultivate botanical knowledge with great ardour, and composed many valuable works. Besides his continued attention to the cryptogamous plants, of his Theory of the Generation and Fructification of which he published a corrected and augmented edition in 1798; he diligently purified his researches into the structure of plants, and rectified the false opinions which had prevailed upon the following points; the efficacy of the medulla or pith; the pre-formation of the flowers; the excrement of plants; the nature of trunks; the cotyledons of seeds; the living births of plants; and hybrid germination. He also ascertained the nature, the structure, life, and duration of vegetable organisms, and the several uses of the leaves; for particulars of all which see the article BOTANY, vol. iii. p. 237-253; and the correspondenr Engravings. In the midst of these occupations his spirits received a great shock from a nervous fever, under which he funk on February 7, 1799, in the sixty-ninth year of his age. Dr. Hedwig was a man of great modesty and candour, benevolent, friendly, and upright; little solicitous of wealth and honours, and void of all parade in teaching and writing. He attained his eminence solely by patient and laborious industry. He is said to have been endowed with a remarkably strong sight, which was of infinite assistance to him in making his compound microscopes for the inspection of mofles, and other microscopic researches. His numerous writings are chiefly in the German language. A poetical work entitled Specierr Mycorum frondosorum 4to. with many plates, was published at Leipzig in 1801, by Frederic Schwartigren. He left two sons; one an eminent painter at Magdeburg; another, Romanus Adolphus, Dr. of Divinity, of Leipsic, and already known by several botanical publications.

Hedwigia, [from the above Dr. Hedwig.] In botany, a genus of the clafs oecandria, order monocotyledon, family Mycorum. The generic characters are—Calyx: perianthium one-leaved, cup-shaped, four-toothed; teeth minute, ovate, sharp, upright. Corolla: monopetalous, tubulous; the tube the length of the calyx, narrower at top; border quadrid; the clefts ovate, sharp, upright, converging. Stamina: filaments eight, broad, inserted into the base of the corolla, incumbent, the upper truncated, oblong, sharp, converging above the stigma. Perigynium: germinal, eight-stalked, superior, style none; stigma blunt. Pericarpium: capsule trilocous (composed as it were of three ovate acuminate capsules), large, three-celled. Seeds: nuts solitary, ovate, acuminate, one side convex and very smooth, the other wrinkled and close; kernels the shape of the line nuts.—Essential Character. Calyx four-toothed; corolla four-cleft; style none; capsule trilocous; seed a nut.

Hedwigia balsamifera, a solitary species. It is a lofty tree, growing to the height of more than sixty feet, with a trunk four or five feet in circumference; outer bark grey and even; inner red, thick and gummy; wood folid, and reddish. Leaves oval, ending in a lengthened point at top, without any indentations, thin, shining, waved, yellowish green, five or six inches long, and three inches wide, ranged in pairs along a midrib, terminated by an odd one. The flowers grow in a raceme on the extremities of the stems, and are of a pale yellow. The fruit is the size of a small nut, divided into two or three parts, covered with a green coriaceous rind, and containing a white fleshy sweet pulp, having an aromatic smell; each division has in it a flattened woody shell, including a bitter oily kernel. Native of St. Domingo; where the wood is used as timber for various purposes.

Hedyacarya /a/ [from the Greek κακός, sweet, and μοίος, a nut]. In botany, a genus of the clafs dioecia, order iccoendria, natural order of febrabilis, (urtice, juf/). The generic characters are—Calyx: perianthium one-leaved, flat-wheel-shaped, eight or ten cleft; clefts lanceolate, nearly equal. In the female permanent. Corolla: none. Male. Stamina: filaments none; antherae very many (fifty), oblong, four-furrowed, bearded at the tip, distributed along the whole bottom of the calyx. Female. Perigynium: germs numerous, flattened-globular, placed each on a cylindrical pedicle in the middle of the calyx; styles none; stigmas papillose flattened over the pericarpium. Pericarpium: none. Seeds: nut, globular, four or ten, pedicelled, of vegetable substance; kernels solitary, globular. Keel: in the middle of the calyx, woolly.—Essential Character. Calyx, eight or ten cleft; corolla none. Male. Filaments: none; antherae in the bottom of the calyx, four-furrowed, bearded at the tip. Female. Genus pedicelled; nuts pedicelled, one-fed. Hedyacarya dentata, the only species known, is a smooth shrub. Leaves alternate, oblong, ferrate, on short petioles, very smooth, veined; the veins almost transverse; racemes axillary; calyces hirsute; nuts very sweet. Native of New Zealand.
itself every year. The wood is hard, whitish, and when young grows only to the height of three or four feet, with a reddish heart, covered with fibres, one celled; the shell hard.

The flowers grow in a spike at the ends of the branches and twigs; they are white, close, and sepalate: none; drupe oval, one-celled; nut ovate, covered with fibres, more or less, and separated with difficulty from the fibres in the pulp: the kernel is two-lobed. Native of Guiana, where it is called calignia by the natives, which is very fond of the fruit, which is ripe in October and November.

2. Hedyotis rupestris: leaves four-faceted awl-shaped, flowers stalked, axillary, corolla villose with a crooked tube. This is a shrub, seldom exceeding three feet in height. Branches diffused, often procumbent at the base, otherwise erect. Leaves linear, acuminate, quite entire, fleshy, thick, shining, grooved at the back, convex on the sides, opposite, numerous. The petals are united on each side by a membrane embracing the branch, and blunt with a point. Flowers in axillary clusters, without smell. Native of Jamaica. Native of Havannah, on rocks by the sea coast; also of Jamaica.

3. Hedyotis sinuata: flowers oblong, leathery, corolla villose with a crooked tube. This is a shrub, seldom exceeding three feet in height. Branches diffused, often procumbent at the base, otherwise erect. Leaves linear, acuminate, quite entire, fleshy, thick, shining, grooved at the back, convex on the sides, opposite, numerous. The petals are united on each side by a membrane embracing the branch, and blunt with a point. Flowers in axillary clusters, without smell. Native of Jamaica. Native of Havannah, on rocks by the sea coast; also of Jamaica.

4. Hedyotis auriculata, or earwort: leaves lanceolate-ovate, flowers in whorls. Stems smooth, long; branches long, jointed, alternate. It is accounted a specific in deafness. Native of Ceylon.

6. Hedyotis graminifolia: leaves linear, stem decumbent, panicle racemose with the flowers directed one way, peduncles following the fun. Perennial; seeds fleshy, weak as in Stellaria graminea, a foot long. Leaves remotely opposite. Corolla white, the segments before noon expanding very wide, in the evening two upright, and two bent back. Seeds very minute, numerous. Native of the East Indies. It is repeated under the name of Oldenlandia fricta in Syll. Veg. 162. 10. but it belongs rather to this genus.

7. Hedyotis hispida: leaves linear-lanceolate, flowers in whorls. Stems half a foot in length, decumbent, quadrangular, hispid, with a branch or two. Brought from Canton by Wennergberg.

8. Hedyotis rupestris: leaves four faced awl-shaped channelled; flowers fleshy, axillary, corolla villose with a crooked tube. This is a shrub, seldom exceeding three feet in height. Branches diffused, often procumbent at the base, otherwise erect. Leaves linear, acuminate, quite entire, fleshy, thick, shining, grooved at the back, convex on the sides, opposite, numerous. The petals are united on each side by a membrane embracing the branch, and blunt with a point. Flowers in axillary clusters, without smell. Native of Jamaica. Native of Havannah, on rocks by the sea coast; also of Jamaica.

HEDYNIUS, f. in botany. See CUNILA.

HEDYOTIS, f. [from the Greek χεδός, sweet, and ετερ, a fpecies (specific in deafness).] In botany, a genus of the clafs monandria, order monogynia. Essential generic characters—Calyx: one-leaved, appearing as if broken; corolla white; stigma long, and free from the ovary at the base by two opposite (fipules). The flowers grow in a spike at the ends of the branches and twigs; they are white, close, and sepalate: none; drupe oval, one-celled; nut ovate, covered with fibres, more or less, and separated with difficulty from the fibres in the pulp: the kernel is two-lobed. Native of Guiana, where it is called calignia by the natives, which is very fond of the fruit, which is ripe in October and November.

1. Hedyotis maritima: leaves oval blunt; flowers oblong, leathery, corolla villose with a crooked tube. This is a shrub, seldom exceeding three feet in height. Branches diffused, often procumbent at the base, otherwise erect. Leaves linear, acuminate, quite entire, fleshy, thick, shining, grooved at the back, convex on the sides, opposite, numerous. The petals are united on each side by a membrane embracing the branch, and blunt with a point. Flowers in axillary clusters, without smell. Native of Jamaica. Native of Havannah, on rocks by the sea coast; also of Jamaica.

2. Hedyotis rupestris: leaves oval blunt; flowers oblong, leathery, corolla villose with a crooked tube. This is a shrub, seldom exceeding three feet in height. Branches diffused, often procumbent at the base, otherwise erect. Leaves linear, acuminate, quite entire, fleshy, thick, shining, grooved at the back, convex on the sides, opposite, numerous. The petals are united on each side by a membrane embracing the branch, and blunt with a point. Flowers in axillary clusters, without smell. Native of Jamaica. Native of Havannah, on rocks by the sea coast; also of Jamaica.

3. Hedyotis graminifolia: leaves linear, stem decumbent, panicle racemose with the flowers directed one way, peduncles following the sun. Perennial; seeds fleshy, weak as in Stellaria graminea, a foot long. Leaves remotely opposite. Corolla white, the segments before noon expanding very wide, in the evening two upright, and two bent back. Seeds very minute, numerous. Native of the East Indies. It is repeated under the name of Oldenlandia fricta in Syll. Veg. 162. 10. but it belongs rather to this genus.

4. Hedyotis hispida: leaves linear-lanceolate, flowers in whorls. Stems half a foot in length, decumbent, quadrangular, hispid, with a branch or two. Brought from Canton by Wennergberg.

8. Hedyotis rupestris: leaves four faced awl-shaped channelled; flowers fleshy, axillary, corolla villose with a crooked tube. This is a shrub, seldom exceeding three feet in height. Branches diffused, often procumbent at the base, otherwise erect. Leaves linear, acuminate, quite entire, fleshy, thick, shining, grooved at the back, convex on the sides, opposite, numerous. The petals are united on each side by a membrane embracing the branch, and blunt with a point. Flowers in axillary clusters, without smell. Native of Jamaica. Native of Havannah, on rocks by the sea coast; also of Jamaica.
HEDYSARUM. 301

pappus of five eréthifh awned chaffs. Receptionum: naked.—Essential Character. Calyx calyciform, with short
scapes; seeds crowned with the calyx, outer without
down, covered up in the scales of the calyx; inner having a
down of five eréthifh awned chaffs; receptumum naked.

This genus embraces some species of Hysoraris and
of Croçis; and, according to Junius, Lafana zac-
cinthia, Linna. For Hudson's species of Hedynopsis, see
Apargia; see also Leontodon and Tragopogon.

HEDYSARUM, [from the Greek, sweet, and
seed. In botany, a genus of the clafs diad-
phils, order decaandria, natural order of papilionaceae
or leguminòse. The generic characters are—Calyx : 
perianthium one-leaved, half five-cleft; clefts subulate,
upright, permanent. Corolla: papilionaceous, frefked;
reflex-comprifed, ovate-oblong, emarginate, long;
wings oblong, narrower than the other petals,
fray, keel ftraight, comprifed, broader outwardly,
transversely blunt, from the bafe to the fwellig part
bifid. Stamina : flaments diapholous, (fimple and nine-
cleft,) bent in at a right angle; antherc roundiged,
comprifed. Poftillum: germ flender, comprifed, linear;
style flubulate, bent in with the flamens; stigma very
fimple. Persicarpium: legume with roundiged com-
prifed one joint, containing one feed. Some have
one joint only, containing one feed. Some few have both
joints, two-valved and containing one feed. Seed:
flamineous, bent in with the stamina; fubfipulated
with a filiform ftipule. The

The numerous fpecies of this genus are moftly herba-
cous: some few, however, (1, 6, 12, 13, 17, 18, 27, 29, 39,
49, 43, 46, 55, 57, 60, 72, 74, 75, 81, 83,) are shrubby, at
leaf at bottom. The leaves are fimple, ternate, or une-
qually pinnate; in one cafe only binate: hence the
fubfordinate division of the genus into four parts. The
ftipules are diftant from the petiole. The petiolules of
the ternate leaves are joined into the petiole, and are
frequently fubftipulated with a filiform ftipule. The
flowers are axillary with one or many flowered pedun-
cles; or they frequently terminate the fem in spikes or
panicles. The bracts are fometimes large, varying in
their conftitution; sometimes small, or even almost
avenefcent. The legume varies in form, being in some
fpecies subcylinigdic with truncate joints; in others com-
prifed, or fometimes cone-shaped, contiguious; the density
of the legumes is diftinguished by its three-fded faramentofe
fem, its fpotted leaves, and its two-jointed legumes.

Native of India; perennial.

Hedyfarum fororium: leaves kidney-shaped, emar-
ginate, fimple. Pericarpium : legume with roundiged
comprifed, one joint, containing one feed. Native of
India, and the fuburbs of Canton in China.

8. Hedyfarum fororium: leaves kidney-shaped, emar-

9. Hedyfarum vespertilionis, or bat-winged hedy-

10. Hedyfarum Gangeticum, or oval-leaved hedy-

11. Hedyfarum malacatum, or spotted hedy-

Vol. IX. No. 566.

Hedyfarum: leaves lanceolate acute; ftem unarmig-
flipules fcariofe. Native of India.

3. Hedyfarum linifolium, or flax-leaved hedy-

4. Hedyfarum unifolium, or hare's-ear-leaved

5. Hedyfarum moniliferum, or necklace hedy-

6. Hedyfarum jflarifolium, or flax-leaved hedy-

7. Hedyfarum reniforme, or kidney-leaved hedy-

8. Hedyfarum fororium: leaves kidney-shaped, emar-

9. Hedyfarum vespertilionis, or bat-winged hedy-

10. Hedyfarum Gangeticum, or oval-leaved hedy-

11. Hedyfarum malacatum, or spotted hedy-

Vol. IX. No. 566.

Hedyfarum: leaves lanceolate acute; ftem unarmig-
flipules fcariofe. Native of India.

3. Hedyfarum linifolium, or flax-leaved hedy-

4. Hedyfarum unifolium, or hare's-ear-leaved

5. Hedyfarum moniliferum, or necklace hedy-

6. Hedyfarum jflarifolium, or flax-leaved hedy-

7. Hedyfarum reniforme, or kidney-leaved hedy-

8. Hedyfarum fororium: leaves kidney-shaped, emar-

9. Hedyfarum vespertilionis, or bat-winged hedy-

10. Hedyfarum Gangeticum, or oval-leaved hedy-

11. Hedyfarum malacatum, or spotted hedy-

Hedyfarum: leaves lanceolate acute; ftem unarmig-
flipules fcariofe. Native of India.
one above another, or sometimes three together, on very slender peduncles, forming a long thin spike, in which each pair of flowers is placed in a contrary situation to the next; corolla pale violet, (reddish yellow, Miller,) the wings white at the base, and pale blue towards the end. The keel is also white above, and of a filthy, hoary-villosous underneath; stems branched, procumbent; racemes simple, erect, terminating. Root long, small, woody; leaves a foot long, reddish, round, rough, woody. Leaves at unequal distances, on pedicles half an inch in length; leaflets pale underneath, the middle one longest. Corolla purple. Legumes crooked, forming a ferrule, the joints united by fo small an isthmus, that when they adhere by their roughness to the clothes, they separate, whence the Portuguese name of erva d'amor. Every joint contains one pale yellow seed. It grows almost in every where in the woods of Jamaica.

26. Hedyfarum canum: leaves ovate, acuminate, hoary underneath; stem columnar, branched, erect; racemes terminating erect; legumes declined, rough with hairs; stem roughy, about five feet high, dividing into several branches. Native of Jamaica, whence Dr. Houftoun sent the seeds to Mr. Miller, and also of Hispaniola.

27. Hedyfarum retroflexum: racemes erect; legumes pendulous, many-jointed. A shrub; very much resembling H. lineatum, No. 24, but the legumes have several joints united by so small an isthmus, that when they adhere to the clothes, they separate. Native of Jamaica; whence the seeds were sent by Dr. Houftoun to Mr. Miller, who must therefore have cultivated it before 1733.

28. Hedyfarum trigonum: leaves ovate, acute, rough with hairs; stem climbing three-sided; racemes very long, axillary; legumes withered, bent in. It is a climber, and raifes itself generally to the top of the taller trees in the wood. The stem is everywhere beset with small hooked bristles, or rough hairs. The leaves are much like those of the kidney-bean; and all the branches terminate in a large and beautiful flower-spike. Native of Jamaica; whence the seeds were sent by Dr. Houftoun to Mr. Miller, who must therefore have cultivated it before 1733.

29. Hedyfarum umbellatum: peduncles umbelliform; stem roughy, a shrub with woody branches, the lower ones round and brown, the upper ones angular and villous; flowers white. Native of India, Tanna, and New Caledonia.

31. Hedyfarum lappaceum: leaves ternate, obcordate; flowers axillary, subfolitary; legumes two-jointed, with hooked bristles. Stems subterraneous, prostrate, pubescent, round, the thickness of a pigeon's quill, very much branched.

32. Hedyfarum heterocarpon: flowers panicule-spired; legumes jointed, the lowest one-seeded; lips bristle-shaped. Stems round, herbaceous, draked, smooth, drooping, two feet high and more. Flowers flesh-coloured. Native of Ceylon, China, Japan, and the Society Isles.

33. Hedyfarum vividum: legumes membranaceous, even, entire; stem and branches hispid. Native of India.

34. Hedyfarum scoripinus: leaves oblong, bifoliate underneat; stems procumbent, three-cornered; racemes axillary; legumes roundish, upright. It grows in tufts, and seldom rises above sixteen or seventeen inches from the root. Native of Jamaica and Hispaniola.

35. Hedyfarum Canadense, or Canadian hedyfarum: leaves simple and ternate; stem even; flowers racemose. An upright plant, and musily hispid; perennial. Native of Virginia, and Canada; flowering in July and August. Cultivated in 1692, according to Parkinson, by Dr. Houftoun from the seeds sent by Mr. Miller, to whom Dr. Houftoun sent the seeds from Vera Cruz. There is a variety called H. bifolium, which is found wild near Canton, and in Ceylon.

36. Hedyfarum gyrans, or sensitive hedyfarum: leaves ovate-lanceolate, obtuse; the lateral ones minute. Root branching, perennial. (biennial, Hort. Kew, annual, Swartz.) Stem roughy, three feet high, wand-like, upright.
HEDYSARUM, AND HELOTIUM.

London: Published as the act directs March 2, 1829 by J. Walker.
HEDYSARUM.

upright, very smooth, round, without knots. Leaves of a bright green, with the middle part of a more glossy appearance than the rest. Flowers pale red, slightly tinged with blueish, and sometimes yellowish. The singular motion with which the lateral leaflets or appendages of this plant are ended is thus described in Linnaeus's Supplement. "This is a wonderful plant on account of its voluntary motion, which is not occasioned by any touch, irritation, or movement in the air, as in Mimosa, Oxalis, and Dionaea; nor is it so evanescent as in Amorpha. No sooner had the plants raised from feed acquired their ternate leaves, than they began to be in motion this way and that; this movement did not cease during the whole course of their vegetation, nor were there any times when it was entirely stopped. Swartz observes that the motion is irregular, and that it sometimes ceases entirely; that in a very hot day it is impossible, being agitated only in the evening, and that flowly. In our climate the leaves in general only make a faint and feeble attempt towards the middle of the day at exerting their extraordinary faculty. We are at a loss to determine what is the cause of this motion; whether it is occasioned by any external cause that we can trace, and which we are not able to excite by any art that we possess. It is not the action of the sun's rays, for this plant is fond of shade, and the leaves revolve well on rainy days, and during the night; exposed to too much wind or sun, it is quiet. Perhaps says Linnaeus, there may be some part in vegetables, as in animals, where the cause of the motion resides. It is a native of Bengal near the Ganges; and is called there buram chandali or barum chandali. It grows luxuriantly, and flowers, in the gardens at Jamaica. It was introduced here in 1775 by Patrick Ruffell, M.D. and flowers in July and August.

47. Hedyfcarum canescens, or rough-leaved hedyfcarum: leaves scabrous underneath; stem hispid; flowers red, oblong, obcordate; ftem upright; racemes very long, upright. Native of North America; introduced in 1787, by Thomas Walter, esq. Perennial. Stems two or three, shrubby, hairy, near two feet high, branching on every side near the top. Flowers at the ends of the branches in short spikes, purplish-yellow and small. It was sent by Dr. Dale from South Carolina. Jacquin's H. frutecens is probably a different plant.

48. Hedyfcarum repandum: leaves rhombic-rounded; stem creeping, rooting; petioles upright; spikes axillary longer than the leaves. This runs many feet from the roots, sending out a few shoots from all the joints that touch the ground, which greatly forwards its luxuriant growth. The leaves are marked with some prominent veins on the under side, and are seldom less than an inch and half in length. Common in the shady hills of Jamaica and St. Domingo.

49. Hedyfcarum viridiflorum, or green-flowered hedyfcarum: leaves ternate, repand, oval-oblong, obtuse, smooth; flowers white, in spikes oblong; calyxes and fruits hirfute, one-seeded. In gardens, the first year it bears mutilated flowers, and yet is fruitful; the second year the corollas are white. Native of Virginia.

51. Hedyfcarum repens, or creeping hedyfcarum: leaves ovate; stems hairy; spikes oblong; calyxes and fruits hirfute, one-seeded. In gardens, the first year it bears mutilated flowers, and yet is fruitful; the second year the corollas are white. Native of Virginia.

53. Hedyfcarum violaceum, or violet-flowered hedyfcarum: leaves ovate; flowers in pairs; legumes naked, veined, jointed, rhomb-shaped; peduncles fubumbellated, lateral. Root perennial. Stem herbaceous, two feet high, rushy, wand-like, round, somewhat furrowed, smooth, somewhat pubescent towards the end; branches of the same length with the stem. When the plant first grows up in the spring, the stems are much pubescent, in greater number, more simple, purple and almost blood-red; in the summer they are green; the lower leaves are fimpie, not ternate, and purplish. Native of India. Linnaeus received the seeds from David van Royen in 1761; it was introduced here in 1776, by Mons. Thouin; and flowers in July and August.

55. Hedyfcarum paniculatum, or panicled hedyfcarum: leaves linear-lanceolate; flowers p anciled; legumes rhomb-shaped. 50. Hedyfcarum nudiflorum, or naked-flowered hedyfcarum: flowering stem naked; leafy stem angular. Flowers purple.

51. Hedyfcarum repens, or creeping hedyfcarum: leaves obtuse; stems procumbent; racemes lateral. Clayton describes the American plant to have procumbent woody stems; smooth leaves; flowers variegated red and
A R U M.

52. Hedyarum hamatum, or hook-podded hedyarum: leaves nerv'd, naked; spikes fissile; legumes two-seed'd, covered, having a hooked point. Root long, deep. Stems many, round, hairy, from seven or eight inches to a foot in length, creeping, branched. Leaves small, smooth, shining, ciliate, having many beautiful white nerves on the under surface. The flowers come out towards the end of the stalks, sometimes flat, sometimes roundish, like those of strawberry-trefoil, sometimes oblong, sometimes not; thickish, frequent; smooth above, somewhat hoary underneath, on slender hairy petioles; at their base a pair of broad flat stiff lines, and another pair at the base of the leaves, which are tender. The flowers consist of a kind of claw, with a keel shorter; that and the wings nearly of the same length; the claw longer; the keel shorter. Germ commonly red. Legume oblong, short, reflex, almost covered, as well as the calyx, and an inferior germ, in the same manner almost as Oenothera.

53. Hedyarum triflorum: leaves obcordate, stems angular, pubesk'd; racemes axillary. 54. Hedyarum barbatum, or bearded hedyarum: flowers axillary, solitary. 55. Hedyarum lagopodioides: racemes oblong, bracteate, with short bracts. 56. Hedyarum microphyllum: leaves ovate, villos; stem frutefcent, upright, smooth; flowers terminating, panicked. 57. Hedyarum racemofum: leaves oblong, filipul'd, smooth; stem frutefcent, upright; racemes axillary, upright, very long; legumes smooth. 58. Hedyarum caudatum: leaves oblong, smooth; stem herbaceous; racemes axillary, terminating. 59. Hedyarum tomentosum: leaves tomentos'd underneath; stem angular, tomentos'; racemes axillary. 60. Hedyarum fruticosum: leaves emarginate, villos; stem frutefcent, upright; flowers axillary, solitary. 61. Hedyarum virgatum: leaves obtuse, with a point; stem angular, hairy; peduncles capillary, three-flowered. 62. Hedyarum fuscum: leaves obtuse, acuminate; stem decumbent, rough with hairs; racemes axillary. 63. Hedyarum striatum: leaves oblong, filipul'd; stem herbaceous; flowers axillary, solitary. All these are natives of Japan.

63. Hedyarum volubilis, or twining hedyarum; leaves ovate-oblong, stem twining. Root perennial. Stems ramping, six feet high and more, slender, not thicker than a quarter of an inch in diameter, more or less glaucous on the under surface, they are shorter than at top, finely haired, twining from left to right, having joints divergent from each other a hand or a span; at every one of these is a trifoliate leaf, on long, slender, smooth, petioles; leaflets blunt, veined, deep green and shining on the upper surface, paler and much glaucous on the under, with a down scarcely visible except in the young leaves. Native of North America.

65. Hedyarum triangulare: flowers ovate, acute, marked with lines; umbels axillary; branches three-branch'd, flexu'oife. This resembles H. lineatum in many respects, but the flowers are more acute, silky-tomentos'd over all the back and on the edge of the upper surface, they are also darker. Native of Jamaica, Ceylon, and Ceylonese plant, which is probably different from the H. alpinum of Linnaeus, which reaches the height of from two to six inches or a little more; hence differing materially from the H. alpinum of Linneus, which reaches the human stature. Root perennial, creeping. Stem annual, seldom branched, upright, terminated by a raceme. Root-leaves on the flowering plant none; stem-leaves from three to eight on each side, with an odd one, ovate-oblong, blunt, with a small point, entire, opposite, on short petioles, hispifate underneath when viewed with a magnifier, marked with lines by veins ascending obliquely. Flowers eight lines in length, imbricate, pendulous, on short peduncles, varying in number, having no fucert; corolla violet-purp'e or red, feldom white; banner spotted with white above the claw; that and the wings nearly of the same length; the keel shorter. Germ commonly red. Legume oblong, compressed, smooth, brownish, with from one to four roundish or oblong joints. Native of the higher Alps, where it flowers in July. Linneus named this species from the obscurity attending it; that, however, has been well cleared up by Jacquin, and we are happy to say it has been successfully cultivated in this country. Haller makes this the same plant as H. alpinum, but Linneus's specimen from Switzerland is very well represented in Haller's figure, and it is certainly a species very distinct from the H. alpinum of Siberia.

66. Hedyarum coronarium, or common hedyarum, or French honey-fuck'le; leaves jointed, prickly, naked,
HEDYSARUM.

naked, straight; stem diffused. Roti biennial. Stems from two to three feet high, hollow, smooth, branching. Leaves composed of five or six pairs of oval leaflets, terminated by an odd one; they are alternate, and from the angles which they form with the stem and branches, peduncles come out five or six inches in length, fluctuating spikes of beautiful red flowers, which open in July and August, perfectly formed in September, after which the roots commonly decay; but if the plants be cut down before they feed, they will last longer. A leaf of this species is shown on the Botany Plate VII. fig. 13. Native of Spain and Italy; Ray observed it in Sicily; in Calabria it grows wild in great luxuriance, near four feet high, affording excellent nourishment to horses and sheep. In the north of Italy it does not well bear the spring in the north of Italy; we may presume, therefore, that it will scarcely bear our climate well enough to answer the purposes of husbandry. Obbeck mentions, that he saw it brought into Cadiz in great bundles, as food for the cattle. In German, French, Italian, and Spanish, it has the name of fuliga; in German it is called kroneschleife, fästschleife, and spanfche klee; in French, fainfoin d'Espagne, and sainfoin à bouquets; in Dutch, jorlyk kaanekop. Parkinson calls it red fainfoin, red flowered fætchleife, and observes that some foolishly call it red or French fætchleife: the foolish name; however, has obtained in England. He informs us (1629), that the variety with a white flower, that some foolishly call it, red or French fætchleife, is an annual plant, and grows naturally forming an obtuse angle at each joint; the seeds ripen are composed of two or three pairs of ovate leaflets terminated by an odd one. The flowers come out in spikes at the top of the stalks, and are of a pale red, intermixed with a little blue. They appear in July, and are succeeded by jointed pods, which are waved on both sides, forming an obtuse angle at each joint; the seeds ripen in autumn. It is an annual plant, and grows naturally in the Levant.

71. Hedyasarum humile, or humble hedyasarum: legumes jointed, prickly, flexuofe; stem diffused. This has some resemblance to the foregoing, but is much smaller. The stalks rise near a foot high, and the leaves are composed of two or three pairs of ovate leaflets terminated by an odd one. The flowers come out in spikes at the top of the stalks, and are of a pale red, intermixed with a little blue. They appear in July, and are succeeded by jointed pods, which are waved on both sides, forming an obtuse angle at each joint; the seeds ripen in autumn. It is a biennial plant, and grows naturally in the Levant.

72. Hedyasarum flexuofum, or waved-podded hedyasarum: legumes jointed, prickly, flexuofe; stem diffused. This has some resemblance to the foregoing, but is much smaller. The stalks rise near a foot high, and the leaves are composed of two or three pairs of ovate leaflets terminated by an odd one. The flowers come out in spikes at the top of the stalks, and are of a pale red, intermixed with a little blue. They appear in July, and are succeeded by jointed pods, which are waved on both sides, forming an obtuse angle at each joint; the seeds ripen in autumn. It is an annual plant, and grows naturally in the Levant.

73. Hedyasarum Virginicum: Stem fhrubby; legumes one-feded, wrinkled; spikes ovate, very hairy; stems erect, hairy. This is an elegant plant, a foot in height, with a perennial root. Stems several, herbaceous, quite simple, the thicknefs of a pigeon's quill, frrated-angular, erect, very hairy; hairs white, long, foft, spreading very much. Native of the Levant and Barbary. See Escaena pinnata, and No. 88.

74. Hedyasarum fruticosum: leaflets alternate, ob-long, foft; lippes fubulate; racemes axillary; joints of the legumes nerved. This is a very handfome plant, grateful to horses, and extremely useful in fixing driving fand. Native of Siberia.

75. Hedyasarum pumilum: stem undershrubby, wings shorter than the banner, and banner shorter than the keel, legumes one-feded. A small fhrub, only a hand in height, the length of the stem, with oval-oblong leaflets. Native of Spain.

76. Hedyasarum argenteum: leaves pinnate; legumes one-feded, wrinkled, without prickles; wings
of the corolla very short; scapes subradiate. Stems under ground woody, above ground scarcely any. The spikes resemble those of the foregoing species, but is whitish. Native of Provence, the county of Nice, and Siberia. Perennial.

79. Hedyasarum caput galli, or cock's-head hedyasarum: legumes one-seeded, teeth of the crest pubescent; wings very short, stem diffused. Native of France and Sicily. It flowers in July and August.

80. Hedyasarum cornutum, or horned hedyasarum: racemes long; legumes bent in; stem shrubby. The structure of the fruitification perfectly resembles that of H. lagopodioides and barbatum; and it is angular, that after the flowering is over, each pedicel is bent back in an arch, the three larger hairy segments of the calyx being bent back, so that the smooth legume is hid, and wrapped up among the pedicels so as not to be visible perfectly, as in the above-mentioned species. It differs, however, in having a lofty, upright, shrubby, stem, almost arboreous; and pinnate leaves, with five oblong leaflets. Native of India, China and Cochin-China. Introduced in 1780, by Sir Joseph Banks, bart.

81. Hedyasarum comosum: leaves pinnate, lanceolate; racemes elongated, cylindrical; stem shrubby. Branches angular, villose. Leaflets three pairs, with an odd one, linear-lanceolate, a span long and more, smooth on both sides, almost equal, veined. It is sufficient to gather enough from H. crinitum, from which it differs in having narrower longer leaves, and a more slender raceme, terminated by bracts in form of a coma. According to Jacquin, this very handsome plant has a perennial root; an upright round stem, a foot and half high, leafy all over, closely hifped, with very white hairs; flowers at first red, but changing early in the spring. It was found in the East Indies by Koenig, and in Guinea by Iffert.

82. Hedyasarum cornutum, or horned hedyasarum: racemes linear; legumes one-seeded, even; stem shrubby; peduncles permanent, thorny. Native of the Levant.

83. Hedyasarum cinnatum, or hoary-leaved hedyasarum: leaves without stipules, hoary underneath; stem erect; flowers in racemes, drooping. Native of Japan.

84. Hedyasarum linearis, or linear-leaved hedyasarum: leaflets lanceolate-linear; spikes terminating; legumes straight, smooth, and even; stem diffused. Stem fuscum, two feet high, branched. Flowers dark violet-colored, small, in upright spikes. Native of Cochin-China. The root is esteemed to be decoftruent, emmenagogue, and to create an appetite.

V. New Species from Miller's Dict. 86. Hedyasarum fericicae: leaves ternate; leaflets ovate, silky underneath; flowers in spikes, axillary, and terminating. Stem hirsute, fix or seven feet high; dividing into several branches. Leaflets pale, green above; flowers small, bright purple. Thunberg and Vahl have given the same trivial name of fericicae to other species. See No. 60, and 76. Native of Vera Cruz.

87. Hedyasarum villosum: leaves ternate; stem diffused, villose; flowers in terminating spikes; calyxes very villose. This is an annual plant, feldom rising more than eight or nine inches high, sending out several branches from the root, which are diffused and hairy. Native of Vera Cruz.

88. Hedyasarum glabrum: leaves ternate; leaflets obcordate; stem panicked; legumes smooth, one-seeded. Stem about two feet high; the upper part branches into pappose flowers, which are of a pale purple colour. Native of Campeachy.

89. Hedyasarum scandens: leaves ternate; leaflets obovate; stem twining; spike very long, bent back. Stem twining, and climbing, to the height of ten or twelve feet. Leaves on pretty long footstalks. Flowers dark purple, fitting close to the stalk. Native of Vera Cruz.

Hedyasarum pedunculatum: leaves ternate, the middle leaflet on a longer petiole; racemes axillary, upright, very long. Root perennial; stem annual, erect, about two feet high; the flowers are produced in long axillary spikes, growing erect; they are small, and of a bright yellow colour, filifile, and succeeded by jointed pods, flat on one side. Native of South Carolina.

Propagation and Culture. The first species is propagated by seeds, which will frequently lie a year in the ground before they vegetate; sow them therefore in pots filled with light earth, and plunge them into a moderate hot-bed; if the plants do not appear by the beginning of June, take them out of the bed, and set them where they may have only the morning fun, and in the autumn plunge them into an old bed of tanner's bark under a frame; in spring plunge them into a fresh hot-bed, which will bring up the plants. When these are fit to remove, put them separately into small pots filled with light earth, and plunge them into a very moderate hot-bed, shading them from the fun till they have taken new root; then gradually inure them to the open air, in which remove them in June, placing them in a sheltered situation, where they may remain till the autumn; at which time plunge them into an old tan-bed under a frame, where they may be protected from frost, and in mild weather enjoy the free air. In a warm house by cover, the plant will endure our winters, when they are not severe.

The other simple-leaved sorts (20-18) and the two-leaved fort, together with the greatest part of the rest, are too tender to thrive in the open air; for their native places of growth are the East or West Indies. They are propagated by seeds, which must be sown upon a hot-bed early in the spring. When the plants are fit to remove, they must be each planted in a separate small pot, filled with light earth; plunging them into a fresh hot-bed, where they should be screened from the sun till they have taken new root; after which they may be treated in the same manner as other tender plants; always keeping them in the dark. If veifile or glass-case, other wise they will not produce seeds, nor even always flowers, in England. They require as much air as possible in warm weather. Many of the sorts seldom flower till the second year.

Of No. 35, the seeds may be sown the beginning of April, in a bed of light fresh earth. When the plants are grown high, they should be transplanted into a hot-bed, and then kept in a sheltered situation, where they are to remain until the following autumn; at which time they should be carefully taken up, and transplanted into the borders where they are designed to stand; for their roots generally run down very deep, so that it is not easy to remove them often. This plant produces its flowers about the same time of the year as the former, and, if the season proves favourable, perfects its seeds in autumn; and the roots will abide in the open air very well, refting the severest cold, provided they are planted in a dry soil.

The common French honeysuckle, and other hardy sorts, are propagated by fowing their seeds in April, in a bed of light fresh earth; and when the plants come up, they should be transplanted into other beds of the like earth, and in an open situation, at about six or eight inches distance from each other, leaving a path between every four rows, to go between them to hoe, and clear the room weeds. In these beds they may remain until Michaelmas, then may be transplanted into the large borders of a parterre or pleasure-garden, allowing them at least three feet distance from other plants, amongst which they should be interperfed, to continue the succession of flowers; where they will make a fine appearance.
ance when blown, especially the red fort, which produces very beautiful flowers. As these plants decay after they have perfected their feeds, there should annually be a fresh supply of plants raised, where they are desirable, for the roots of the menzoo kind continue longer. If hens are very proper ornaments for large borders, or to fill up vacancies among shrubs, but they grow too large for small borders, unless their stumps are pruned off, leaving only two or three on each plant; which, if kept up right with ficks, will prevent their hanging over other flowers. They furnish abundance of food agreeable to cattle, if not suffered to hand till the stumps are too hard and ficky.

Saint-foin, No. 77, if fown upon a dry, gravelly, or chalky, soil, will continue eighty or ninety years; but on a deep moif soil the roots will run down into the ground, and in the winter feaon the moifure will rot them, so that it seldom lasts above two years in such places. It is esteemed one of the beft sorts of fodder for moft cattle, and is a great improvement to chalk hills, upon which it succeeds better than in any other soil, and will continue many years, provided there be a surface of six or eight inches upon the chalk. The bell time for fowing the feed is the beginning of April, according to the feaon, observing always to do it in dry weather, otherwise the feed will be apt to burf, and never come up. The feed being large, the common allowance is four buifhels to an acre, but three is amply fufficient. If it were fown in rows, as directed for lucerne, it would be a great improvement to the plants; for, when the have room enough, they branch out on every fide, and become very ftrong; and by hoefing between them the natural grafs may be kept down, which, if permitted to grow, will rob the faint-foin of its nourifhment, and in time deftruy it. Saint-foin is frequently fown with oats or barley, but this is a very bad method, for what is gained from the crop of corn will be fcarcely deftruyed by the feed, and the feed being large, the com¬ mon holds true in most sorts of grafs-feeds, for the corn growing over it fo weakens the crop beneath, that it fcarceiy recovers its strength in a year after.

The ground in which this feed is fown fhould be well ploughed, and made very fine. If it be fown in drills, the drills fhould be eighteen inches apart, and about an inch deep; if the plants come up too thick, they fhould be hoed out to the diftance of six or eight inches, when the ground is hoed to deftruy the weeds. The firlt year by no means feed the crop down; for, the crowns of the roots being then young and tender, cattle would eat it fo low as to deftruy the roots; and, if large cattle eat it, they will deftroy it fo much as to prevent its floothing again; the firlt year therefore it fhould be mowed, and this fhould be done when it is in flower. The fooner it is carried off the ground, when cut, the better it will be for the plants. It does not require to be fo often turned as other hay, for the flacks being large, they will not lie fo close in the cocks as to ferment; in catching-weather therefore, the cocks may be made large; and, if they be turned and spread every other day, or once in three days, there will be little danger of its heating, fo as to receive damage; but if it be spread, and much exposed to rain and dew, the goodnefs of the hay will be exhaufled.

The crop will be fit to cut the firlt year towards the end of July, or at the beginning of Auflui. After this is cleared off, the roots will foon fhoot again; and by the end of September, provided the fefon be favourable, there will be a fine crop fit for feeding. Sheep will enrich the ground with their dung, and greatly strengthen the roots; but they fhould not be fuffered to remain upon them during the winter. The root of the faint-foin is much troubled with the obftruction of black-grafs which botanifts call brooma flerifus, and farmers know by the name of black-grafs. The fcythes flips it over, the feed ripens very early, and is difficult to separate from the faint-foin feed. It may eafily be pulled up by hand, when...
the crop begins to fail, or the land is wanted for some
thing else, a fain-fain hay may be broken up success-
fully for potatoes; for the red-worm, which makes such
ruines if torn down without purring and burning, will not touch the potatoes.

Modern writers affect to write fain-fain, as it it were
"wholesome hay," whereas it is fain-fain, or "holy hay," from a preformation of its superior excellence. Vulgar persons confound it with eam-fool, from the
found merely, for no two vegetables can be more differ-
He did unfeal them; and the firfl he view'd,
and birds give more

ideas, that have no natural cohefion, come
to take notice of; to attend:
Cautioufly; vigilantly.
Caution; vigilance; attention.

To HEED, v. a. [hebe, Sax.] To mind; to regard;
to take notice of; to attend:

HEEDY, adj. Careful; cautious.

HEEEL, f. [hele, Sax.] The part of the foot that
protrubates behind.—If the luxated bone be difforted
backward, it lieth over the heel bone. Wifeman.—The
whole foot of animals:
The flag recals his ftrength, his speed,
Wifeman.

The feet, as employed in flight.—Nothing is commoner,
in times of danger, than for men to leave their matters
to bears and tygers, and flew them a fair pair of heels
for't. L' Esfrange.—Any thing shaped like a heel.—At
the other fide is a kind of heel or knob, to break clots
with. Mortimer.—The back part of a flocking: whence
the phrase to be out at heels, to be worn out.—A good
man's fortune may grow out at heels. Shakefpeare.

To be at the HEELS. To pursue clofeely; to follow
hard:

Sir, when comes your book forth?
—Upon the heels of my prefentment.
Shakefpeare.

To attend clofeely:

Could we break our way
By force, and at our heels all hell should rife
With blackeft infurrection, to confound
Heaven's pureft light.

Milton.

To pursue as an enemy.—The Spaniards fied on towards
the North to feek their fortunes, being full chafed by the
English navy at their heels, until they were fain to
give them over for want of powder. Bacon.

Want! hungry want! that hungry meagre fend,
Is at my heels, and chases me in view.
Orway.

To follow clofe as a dependant:

Through proud London he came fighing on,
After th' admired heels of Bolingbroke.
Shakefpeare.

To be out at HEELS. To be worn out; to be ruined,
or bankrupt.

To lay by the HEELS. To fetter; to fackle; to put
into gyves. —I began to fmoke that they were a parcel of
mummers; and wondered that none of the Middlefex
juftices took care to lay them by the heels. Addifon.

One half of man, his mind,
Is, fai jurif, unconfin'd,
And cannot be laid by the heels.
Hudibras.

HEEL of a MAST, in a flip, that part of the foot of
it that is pared away flafting, that it may be itaid afted-
ward on.

To HEEL, v. n. To dance:
I cannot fling,
Nor hee the high lavolt, nor sweeten talk. Shakefpeare.

To lean on one fide; as, the fhip heels.

To HEEL, v. a. To arm a cock.

HEEL-PIECE, f. A piece fixed on the hinder part of
the fhoes, to supply what is worn away.

To HEEL-PIECE, v. a. To put a piece of leather on
a fhoes heel.—Some blamed Mrs. Bulf for new heel-peeving
her fhoes. Arboufnets.—Armour for the heel.—Courts are
to be the theatres of your wars, where you fould al-
ways be as completely armed (as Achilles), and even
with the addition of a heel-pieces. Cheferfield.

HEEL-PIECING, f. The act of repairing or renew-
ing the heels of shoes or boots.

HEELING, f. The act of putting on heels; or of
dering.

HEEM (John David de), an eminent painter, born
at Utrecht, in 1604. He was brought up under his father
David, also a painter; and the objects on which he
employed himself were thofe of still life, fuch as flowers,
fruits, vessels of gold and silver, glass, musical instruments, &c. In representing these, no one ever carried far beyond the limits of what the fancy felt to be pleasing. His pictures were highly valued, and sold, even during his life, for astonishing prices; for, although the mere copying of imitations is an inferior department of the art, yet it is one of which all are judges; and perfection in it will always command applause. The objects he chose had likewise intrinsic beauty, and he grouped them with good taste; in short, he was an excellent imitator. He painted the scenery of his native land in all its beauties; and in representing them, no one ever carried them farther east of Nordhausen, and thirty-two north of Erfurt, and county of Schwartzburg Rudolstadt: six miles south of Tubingen, and superintendent of the churches return to Tubingen, to fill the chair of theological professorship, upon very advantageous terms. When he had finished his course of studies in the university, he spent two years in travelling for the tuition of Luther and Melancthon. Having continued there till Eleutherius was chosen to that office, in 177, according to the chronicle of Alexandria, he died in the reign of the emperor Commodus, about the year 180. He was the first author of an ecclesiastical history from the death of Christ to the time in which he lived, which, Eusebius says, contained a faithful relation of the apostolic preaching, written in a simple style. Of the five books of which this work consisted, there now remain only some fragments, preserved in Eusebius's Ecclesiastical History, and one more in Photius's Codex. To Hegesippus, likewise, has been ascribed an History of the Wars of the Jews, and the Destruction of Jerusalem, which has been often published, and particularly at Cologne in 1559, with the notes of Guattarius. It is also inserted in the Biblioth. Patr.

HEEMSTEDE, a town of Holland: three miles south of Haelrem.

HEEPEN, a town of Germany, in Westphalia, and county of Ravenberg: four miles north-north-east of Bielefeld.

HEERBRAND (James), a learned German Lutheran divine, born at Nuremberg, in 1521. He acquired his classical learning at Ulm, from whence he was sent, in 1538, to the university of Wittemberg, and placed under the tuition of Luther and Melancthon. Having passed his examination for the ministry with great applause, in 1544, he was appointed a deacon at Tubingen, where he sedulously devoted himself to the study of theological and critical learning. In 1550, he was honoured with the diploma of doctor of divinity by the university of Tubingen; and in the following year he was nominated one of the deputation of protestant ministers who were to attend the council of Trent; and he repaired to that city with the ambassadors of the duke of Bavaria. In 1556, he was prevailed upon, by Charles marquis of Baden, to remove to Pfortzeim, where he sedulously devoted himself to the study of the Lutheran religion and discipline throughout the dominions of that prince; but was soon induced to return to Tubingen, to fill the chair of theological professor in that university. He was afterwards appointed bishop of Tbingen, and superintendent of the churches in the district of that city; and honoured with the titles of counsellor to the duke, and chancellor of the university. He died in 1600, in the seventeenth year of his age. Besides his Compendium Theologiae, which was his principal work, he left behind him numerous dissertations, sermons, practical pieces, controversial treatises, &c. in the Latin and German languages.

HEERENBERG, a town in the kingdom of Holland, in the county of Zutphen: fifteen miles south-east of Arnhem.

HEERINGEN, a town of Germany, in Upper Saxony, and county of Schwartzburg Rudolphiad: six miles south-east of Nordhausen, and thirty-two north of Erfurt.

HEFT, f. [from heave.] Heaving; effort; may be in the cup.

A spider's web, and one may drink, depart. Vol. IX. No. 337.

And yet partake no venom; for his knowledge is not infected: but if one present
To his Lordship, his ingenuity, in his, make known
How he hath drunk, he cracks his gorge, his sides,
With violent Hefts. Shakespeare.

[For Hefts.] Handle.—His oily side devours both blade and left. Walter.

HEFT, pret. of heave; [used by Spenfer for] threw: The other part behind yet sticking fast
Out of his headpiece Cambell fiercely reft,
And with fuch furie backe at him it left,
That making way unto his dearest life
His weaft-and-pipe it through his gorget eft. Spenfer.

HEFTED, adj. Disposed; as, tender-hefted, tenderly disposed, &c. Shakespeare.

HEGAI, or Heggai. [Heb. meditation.] A man's name.

HEGAU', or Hegow', a name under which is comprehended all that part of Germany, in Schwabia, which borders on the Bodensee, or Lake of Constance.

HEGENSANDORF, a town of Germany, in Westphalia, and bishopric of Paderborn: two miles south-east of Bremen.

HEGESIPPUS, an historian of the second century, and supposed to be born about the commencement of it, as a Jew by birth; but afterwards he became a convert to the Christian faith. He came to Rome while Anicetus was bishop, most probably in 168, and continued there till Eleutherius was chosen to that office, in 177. According to the chronicle of Alexandria, he died in the reign of the emperor Commodus, about the year 180. He was the first author of an ecclesiastical history from the death of Christ to the time in which he lived, which, Eusebius says, contained a faithful relation of the apostolic preaching, written in a simple style. Of the five books of which this work consisted, there now remain only some fragments, preserved in Eusebius's Ecclesiastical History, and one more in Photius's Codex. To Hegesippus, likewise, has been ascribed a History of the Wars of the Jews, and the Destruction of Jerusalem, which has been often published, and particularly at Cologne in 1559, with the notes of Gualterius. It is also inserted in the Biblioth. Patr.

HEGG'BACH, a princely abbey of Germany, in the circle of Swabia, said to have been founded in the eleventh century. The abbess was assisted in the matricula florins, and taxed to the imperial chamber at sixteen rixdollars forty-six kruitzers: twelve miles south of Ulm.

HEGI'RA, f. [Arabic.] A term in chronology, signifying the epocha, or account of time, used by the Arabians and Turks, who begin their computation from the day that Mahomet was forced to make his escape from the city of Mecca, which happened on Friday, July 15, A. D. 622, under the reign of the emperor Heraclius.

See the article Chronology, vol. iv. p. 536, 539.

HEI'BACH, or Heibach, a town of Germany, in the circle of Franconia, and county of Wertheim, situated on the Maine: twelve miles west of Wertheim.

HEICHERLICH. See HAICHERLICH.

HEIDANUS (Abraham), professor of divinity at Leyden, born in Frankenthal, in 1597. At an early age he was placed in the Walloon college at Leyden, where he distinguished himself by his proficiency in the different branches of academic learning, and particularly in theology. When he had finished his course of studies in the university, he spent two years in travelling for further improvement, through Germany, Switzerland, France, and England. About the year 1674, the province of Guelders, having determined on the establishment of an university at Harderwic, offered him the divinity professorship, upon very advantageous terms. This offer he declined, in consequence of having equivalent advantages secured to him by the church of Leyden; and he was soon afterwards appointed to the theological...
theological chair in that university. The duties of that office he discharged for many years, with great reputation; but was in his old age deposed from it. In 1676, the curators published a decree, forbidding the professors to discuss at all certain propositions, some theological, and others philosophical, which they specified, to the number of twenty; prohibiting at the same time the discussion of the metaphysics of Des Cartes. On this decree Heidmann animadverted with freedom and spirit, and published his remarks in the Dutch language. So highly were the curators offended at the appearance of these remarks, that they deposed the author from his post of professor. He died at Leyden, in 1676, after he had completed the eighty-first year of his age. He was the author of:

1. Corpus Theologiae Christianae in quindecim Locis digestum, in 2 vols. 4to. which was published in 1686, by M. Crucius, the author’s grandson. 2. A treatise De Origine Erroris, 4to. 3. An Examination of the Catechism of the Remonstrants. 4. The Cause of God maintained against the Pelagians and Semi-Pelagians. 5. Testamentum Joannis Damascenus, in 2 vols. 4to. which was published in 1690, 4to. 6. De ratione Studiorum Opuscula Aurea, 1670, 12mo. together with Theses, Dissertations, Controversial Tracts, &c.

HEIDEGGER (John Henry), a learned Swiss professeur divin, born at Urfeyelen, near Zurich, in 1633. After studying at the university in Zurich, he visited different seminaries in Germany, and attended a course of theology at Marburg. From that place he removed to Heidelberg, where he studied the oriental languages under the learned Hattinger, and was admitted by him in 1666, the year of his cure, to the degree of doctor of philosophy. Not long afterwards he was appointed professor-extraordinary of the Hebrew language in that university, and also professor of philosophy. In 1659, he accepted of the chair of theology and ecclesiastical history in the college of Steinfurt, in Westphalia; which he resigned in 1665, and returned to Zurich. In that university he filled the post of professor of moral philosophy till the year 1669, when he was appointed professor of divinity. In 1679, when the opinions of Amyrau on the divine decrees had made a considerable progress in the reformed churches of Europe, the Helvetic divines became alarmed for the fate of the genuine Calvinistic doctrine, and employed the pen of Heidigger to draw up a formulary of faith in opposition to that written by a French professor. To this production the magistrates were engaged to give their authority; and to add to it the articles of faith received in the Helvetic church, under the denomination of the Form of Concord. But, like all similar expedients for producing uniformity of opinion, instead of answer-
same height as Peru to the South. *Sibb.*—Summit; ascent; towering eminence; high place.

From Alpine height the father first descends; His daughter’s husband in the plain attends. *Dryden.*

Elevation of rank; flattion of dignity; great degree of excellence.

Ten kings had from the Norman conqueror reign’d, When England to her greatest height attain’d, Of pow’r, dominion, glory, wealth, and state. *Daniel.*

The utmost degree; full completion.—Despair is the height of madness. *Shelley.*

Hid me from the face
Of God, whom to behold was then my height
Of happiness! *Milton.*

Utmost exultion.—Come on, sir; I shall now put you to the height of your breeding. *Shakespeare.*—State of excellence; advance towards perfection.—Social duties are carried to greater heights, and enforced with stronger motives, by the principles of our religion. *Addison.*

**Heights or Land.**—A range of mountains in North America, which extends from south-west to the north-east, and separates the district of Maine from Lower Canada, giving rise to many rivers which fall into St. Lawrence river, and others which fall into the Atlantic Ocean. The principal growth between the Height of Land and St. Francis river is beech, maple, birch, hemlock, and fir, very few white pines, and no oak of any sort. Some of the rivers pass through fine rich fertile vales. *To heighten,* v. a. To raise higher. To improve; to meliorate. To aggravate.—Foreign states used their endeavours to heighten our confusions, and plunge us into all the evils of a civil war. *Addison.* To raise higher. To improve by decorations.—As in a room, contrived for state, the height of the roof should bear a proportion to the area of the rooms pass through fine fertile vales. *To heighten,* v. a. To raise higher. To improve; to meliorate. To aggravate. *Foreign dates.*

At the end of three years he was recalled by his Prussian majesty to Frankfort on the Oder; to which place his Prussian majesty to Frankfurt on the Oder; to which place he was removed in 1733, with a request made by the king, he removed, though, as professor of moral philosophy, and logic. He now considered himself settled for life; but, in compliance with the flowers of polite literature. His principal works are the following: *1. Synagoga Antiquitatum Jurisprudentiae inlustrantium; secundum ordinem institutionum,* Lugd. Bat. 1738. 1741, 8vo. 10. *Hijlona quibus praemia Hisloria Philosofhica,* Halle, 1729, 8vo. 7. *Hijlona quibus praemia Hisloria Philosofhica,* Halle, 1729, 8vo. 6. *Elementa Juris civilis.*

At the end of three years he was recalled by his Prussian majesty to Frankfurt on the Oder; to which place he was removed in 1733, with a request made by the king, he removed, though, much against his will, to Halle, where he arrived in 1733, and died there in 1741, at the age of sixty. Heinecius may be classed among those writers who professed the happy talent of enlivening and embellishing the dry uniformity of jurisprudence with the flowers of polite literature. His principal works are the following: *1. Syntagmata Antiquitatum jurisprudentiae illustrantium; secundum ordinem institutionum.*

**Heidelberg,** a town of Prussia, on the Baltic; eight leagues north-north-east of Danzig. *Addison.*...
early part of his education at the place of his nativity; and in 1693 repaired to Jena, where he took the degree of doctor of laws. In 1695 he next paid a visit to Hamburg and Hamburg und Sankt Hall; and, in 1699, received an invitation to be deacon of the church of St. Peter and St. Paul at Gohlar. Here he continued his studies with the utmost assiduity, and obtained great reputation by several learned works. After nine years' residence at Gohlar he was appointed, in 1709, pastor of St. Ulrich's church, and in 1711 of Our Lady's church, at Halle, where he died in September, 1725. His works are, 1. Germanorum aliarumque Nationum Sigillis eorumque Ufus (3 Praef. Carolina Originibus, Quedlinb. 1707, folio. 2. De Veteribus and duci of Pomerania; four miles south of Rummelburg.

HEINRICHSDORF, a town of Germany, in Upper Saxony, and duci of Pomerania; four miles south of Rummelburg.

HEINRICHSTEIN, a town of Germany, in the arch-duchy of Austria: four miles south-west of Bohemish Waidhoven.

HEINSBERG, a town of Germany, in Westphalia, and duci of Juliers; ten miles south-east of Ruremond. Lat. 51.3. N. lon. 15.36. E. Ferro.

HEINSIUS (Daniel), an eminent scholar and poet, born in 1580, at Ghent. At the age of fourteen he was sent to study the law at Franeker; but his attention was there chiefly devoted to Greek literature, in which he made a rapid progress. On his removal to the university of Leyden, he pursued similar objects; but the principal advantage he there enjoyed was the instruction of Joseph Scaliger, who conceived a high opinion of his capacity, and gave him every encouragement. He was not less in favour with that elegant scholar, Janus Doufa. At the age of twenty he began to read public lectures at Leyden on the Latin and Greek authors. He was afterwards appointed secretary and librarian to the university. In 1659 he was appointed secretary to the states of Holland at the Synod of Dort. His great reputation procured for him the title of counsellor to Gustavus Adolphus, and of knight of St. Mark at Venice. Pope Urban VIII. made him great offers if he would settle at Rome; but he preferred remaining at Leyden, where he died in 1665. As a compiler of dictionaries and grammars, he was celebrated, and undoubtedly places him among the best compilers of modern Latin verse. They consist of elegies, niscellae, and two tragedies; one of which, entitled "Herodes Infanticius," was thought worthy of being made a subject of controversy among the learned. His Greek poems were also much esteemed. More than ten editions of his Latin and Greek poems were printed at Leyden, Amsterdam, Wurtemburg, and other places. Among the public examinations on a variety of subjects, especially the history of Denmark. He spoke German, Latin, French, and Low Dutch, and was exceedingly god-natured and well-behaved, but of a most tender and delicate bodily constitution; never ate any solid food, but chiefly subsisted on nureis' milk. He was celebrated, says the account, all over Europe, under the name of the Learned Child of Lubeck. He died at the age of four years, four months, twenty days, and twenty-one hours; and his death was recorded in a number of periodical papers.—We give this account as we received it.

HEINENFELD, a town of Germany, in Franconia, and county of Wertheim: nine miles north-east of Wertheim.
queen Christina spoke highly of his poems, he took a voyage to Sweden, where he was well received; and he made a journey through France and Italy, for the purpose of purchasing manuscript copies of the old masters for Christ's sake. the heir's judgment is that of Amsterdam, 1666, 1670. His elegies, and his panegyric on queen Christina, are thought his best works. He was the editor of two editions of Claudian, three of Ovid, and of Prudentius and Velleius Paterculus, with notes. After his death were published his notes upon Valerius Flaccus, Silius Italicus, Petronius, Phaedrus, Q. Curtius, Tibullus, and Tacitus. An edition of Virgil at Amsterdam, in 1745, contained his notes on that author, then first published. His Latin letters, written with much purity, were published by Burman in his collection of Epist. Viro. Erudit. Illusfr. and others, written to the learned Magliabecchi, appeared in 1745, published by Targioni. For a list of Burman's writings see Brev. Heineuse, f. A hunting term: a roebuck of the fourth year.

Heinzenberg, a mountainous district of Swisserland, in the country of the Grifons, and one of the most beautiful and fertile in the country, full of corn-fields, meadows, small lakes, and forests intermixed; situated to the south of the bishopric of Coire. Heir, f. [heirs, old fr. herre, Lat.] In law, he who succeeds by descent to lands, tenements, and hereditaments, being an estate of inheritance. The estate must be real, because nothing can pass jure hereditatis but real; and by the common law a man cannot be heir to goods and chattels: though the civilians call him heir hereditarius, qui ex testamento succedit in universam jus testamenti. Heirs are included in the word assigns in grants, &c. If a woman keeps lands from the heir, on pretence of being pregnant by the heir's ancestor, her deceas'd husband, the writ de onde insinuando is to be granted to search her, &c. that the heir be not defrauded. P. N. B. 327. But heirs may have divers writers, as writ of mortmain, entre ad communem legem, in cafu probatis, and confimili causa, quod permittat, &c. The heir may also bring an ejectment of copyhold lands before admittance. 2 Will. 14. Of the different kinds of heirs, the most usual division is, of heirs apparent, heir presumptive, heir general, heir special, heir by custom, and heir by devise, called his his heir apparent, giving bonds to pay double or treble the money lent, after his father's death, are set aside in equity, but mostly by paying what was lent bona fide, with interest, if the obligor applies for relief, though in cases the obligee fails, he shall not recover what was really lent; for that would be to afford fraud. 1 Vern. 141. When young heirs enter into any bond, chancery relieves against it, without evidence of actual imposition; because there is a supposed dower, and preemption of a lien's benefits to be imposed on. Barnardif. 481. The rule upon the subject of equity in cases of non est rei, is that the heir is not merely in respect of the age of the heir contracting. P. Wms. 131. In Wifeman v. Beake, Mr. Wifeman was nearly forty years of age, and a proctor in the commons; in Curvyn v. Milner, the heir was about twenty-seven years of age; and in Gwynne v. Hecan, the plaintiff was twenty-three years old; which, though not an advanced age, is more than enough to give the heir the benefit of discretion. But the real object which the rule profeses is, to restrain the anticipation of expectancies, which must from its very nature furnish to designing men an opportunity to profit upon the experience or passion of a disjunct man. And this being the object of the rule, its operation is not confined to heirs, but extends to all persons, the prejudice of whose wants may be considered as obstructing the exercice of that judgment which might otherwise regulate their dealings. 2 Vern. 42 Perreif. 111. 2 Atk. 424. Heir general, or heir at common-law, is he who after his father's or ancestor's death hath a right to, and is introduced into, all his lands, tenements, and hereditaments. But he must be of the whole blood, not a bastard, alien, &c. None but the heir general, according to the scope of the common-law, can be heir to a warranty, or for an appeal of the death of his ancestor. Co. Lit. 13 a. Cro. Jac. 217. If a condition be annexed to Borough-English or Gavel-kind lands, and the condition is broken, the heir at common-law shall enter; for the condition is a thing of new creation, and collateral to the land; but when the eldest son enters, the heir or heirs by custom shall enjoy the land; for by breach of the condition they are restored to their ancient estates. Piso. 28. Co. Lit. 11. Special heir, is the issue in tail, claiming per se donum; and as the statute de donis prefers the estate to him, his ancestor cannot grant or alien, nor make any rightful estate of freehold to another, but for term of his own life. Lit. 613. Heir by custom, must be founded on ancient usage. A custom in particular places varying the rules of descent at common-law is good; such is the custom of gavelkind, by which all the sons shall inherit and make but one heir to their ancestor; but the general custom of gavel-kind lands extends to sons only; yet a special custom, that if one brother die without issue, all his brothers may inherit, is good. Co. Lit. 140. Heir by devise, or heres facius, is only a devise of lands, being made by the will of the testator, and has no other right or interest than the will gives him. 3 Co. 23 a. It has been held in chancery, that such an heir shall have the aid of the personal estate in discharging the debts of the testator. 1 Vern. 36. But this must be under understood of an heres facius of the whole estate, who shall have the benefit of the personal estate, but a devise of particular lands shall not. The eldest son, after the death of his father, is at common-law his heir, and if there be grandfather, father, and son, and the father die before the grandfather, and the eldest son enters, the heir or heirs by custom shall enjoy the land; for by breach of the condition they are restored to their ancient estates. 1 Vern. 14. The eldest son, after the death of his father, is at common-law his heir, and if there be grandfather, father, and son, and the father die before the grandfather, and the eldest son enters, the heir or heirs by custom shall enjoy the land; for by breach of the condition they are restored to their ancient estates. 1 Vern. 14. The eldest son, after the death of his father, is at common-law his heir, and if there be grandfather, father, and son, and the father die before the grandfather, and the eldest son enters, the heir or heirs by custom shall enjoy the land; for by breach of the condition they are restored to their ancient estates. 1 Vern. 14.

There are some who cannot be heir; as one born out of lawful wedlock; an alien, born out of the king's allegiance, though in wedlock; a man attainted of treason or felony, whose blood is corrupted; these last cannot be heirs proper delictum; and an alien cannot be heir, proper delictum subjiciens; nor may one made denizen by letters patent; though it is otherwise of a person naturalized by act of parliament. Co. Lit. 8. A person born out of wedlock, by continuance, may be heir against a stranger; and an emigrand may be heir, and take according to that fact which is most prevalent; but a moister, who hath not human shape, cannot be heir, although a persona de solla, in the lands and lunatics, persons excommunicate, attainted in prerunmary, outlawed in debt, &c. may be heirs. 2 Dan. 553.

By the law of England, no person can take to himself an inheritance in fee-simple by deed, without the word heirs; but he may by devise: though in cases where...
the word heir is wanting, it has been adjudged that if there were other words equivalent, and the interest in the thing granted paffeth by the consideration only, without any further ceremony in the law, an estate in fee may pass. 2 Nelf. Abr. 933. In a deed by will, or exchange, &c. the word heirs is not necessary that estates of inheritance which are otherwise conveyed, require it. 1 Jenk. Cent. 196. The word heir is nomen collectivum, and extends unto all heirs; and under heirs, the heirs of heirs are comprehended in infinitum; if lands are given to a man and his heirs, all his heirs are totally in him, that he may give his lands to whom he will. Trin. 23 Jac. 1. Nov. 46.

All conditions and covenants real, or such as are annexed to estates, shall descendent to the heir, and he alone shall take advantage of them. 43 Edu. III. c. 4. And this is not only where there are express words, but also where there are none; for the law by implication reserves the condition to the heir of the feoffor, &c. for being prejudiced by the disposition, it is but reasonable that he should take the same advantage that his ancestor whom he represents might. 1 Rol. Abr. 407. And as the heir-at-law is the proper and only person, who can take advantage of conditions, &c. annexed to the real estate; for the heir is bound by all former conditions, &c. which run with the land, whether such conditions were annexed to the estate by the original seoffor, grantor, or immediate ancestor. 1 Rol. Abr. 421.

Where a condition is annexed to the estate given to the heir, and which goes in abridgment and restraint thereof, the same shall in some cases be construed a limitation; for if it were a condition, nobody could take advantage of it but the heir. Dyer 316. As if a copyholder was heir to some lands, the copyholders were given to a man and his heirs, all his heirs are totally in him, that he may give his lands to whom he will, by its: but in covenants of others, that concern the inheritance, the heir shall have the benefit of them, though not named. 1 Rol. Abr. 520.

The heir must be expressly named, otherwise he is not chargeable, and the reason why the heir is not chargeable in this case, as the executor in case of a bond entered into by the feoffor, without being named, is this: By the common-law only the goods and chattels of the debtor, and the annual profits of the land as they arose, and not the land itself, were liable to execution for debt or damages, because these being the security the creditor depended upon, they were liable in the hands of his representative as well as in the hands of the debtor himself; hence it was, that the executor was bound by the debt of the tenant, so far as he had chattels or effects, though he was not named in the contract; but the land was not liable to execution, because it was preserved from the personal contracts and engagements of the tenant, that he might be the better able to answer the feudal duties to the lord, which were the life and support of government; therefore the land not being originally liable to the demand in the hands of the obligor, must be much less liable in the hands of the heir, who was not comprehended in the contract. 2 Lev. 19. Plow. 440. Hob. 60.

If the ancestor binds himself in a statute, recognizance, &c. the heir is liable, not only as tenant, but also as heir, otherwise he could not have his age; and cannot oblige a purchaser, whether for valuable consideration or without, to contribute; but one heir may oblige another to contribute; as if a man leased of two acres, the one descendable according to the course of the common law, the other in Borough English, acknowledge a statute, &c. the heir at common-law shall oblige the Borough-English heir to contribute: so one coparcener shall oblige the other to contribute; or if the conner had lands, some descendible to the heirs of the father, and some descendible on the heirs of the mother, the heir on the former shall not be bound to the heir on the part of the mother to contribute; &c. &c. see supra. 3 Co. 12. Sir William Herbert's case.

Not only land, but rent not due at the death of the ancestor leifor, shall go to the heir; 10 corn fown by a tenant for years, where his term expires before the corn is ripe. every thing fastened to the freethold, timber trees, deeds belonging to the inheritance; deer, coxes, pigeons, fift, &c. 2 Nelf. Abr. 927. An heir shall enforce the administrator to pay debts with personal estate, to preserve the inheritance. Ch. Rep. 380, 293. If an executor hath affairs, he is compelled in equity to redeem a mortgage, for the benefit of the heir; and it is the same where the heir is charged in debt. Hard. 371. For the personal estate received the benefit. When the heir is sued for the debt of his ancestor, and pays it, he shall be reimbursed by the executor of the obligor, who hath personal effects. 1 Ch. Rep. 71. But in action of debt brought upon a bond against an heir, it is no good plea for the heir to say, that the borrowers have effects in their personal estate. Dyer. 267. Sec. 75. Though the executor, and heirs and executors are both chargeable upon specialties. If an heir hath affairs, and the executor also, it is at the election of the oblige to have action of debt against the one or the other; but he shall not
of charge them doubly, 2 Plowd. 453. The heir shall not have money due on mortgages in fee, if he be not particularly named, but the executor; and if the day be passable, although the heir be named, the executor shall have it. Co. Lit. 210.

If the testator makes a specification of what goods and chattels go to the heir, viz. Goods and chattels annexed to the freehold go to the heir, and not to the executor or administrator: as, the glass in a window; the doors and locks of a house. 21 H. VII. 26 b. 4 Co. 63 b. So the worth, nails, and rails for an inclosure. 21 H. VII. 26 b. Furnaces, cupboards, and such furniture as is fixed to the houses; R. 21 H. VII. 26 b. unless they are severed in the lifetime of the testator. Som. 4 Sat. 368. So wainscot fixed to a house. 4 Co. 64 a. So pictures, glafes, &c. fixed instead of wainscot. 2 Vern. 508. So, millstones, &c. fixed to a mill.

So a term for years to attend the inheritance does not go to the executor, but to the heir. R. 2 Co. 136, 105. So deer in a park, coules in a warren, and doves in a dove-house, go with the inheritance to the heir. So, fish in a pond, or pycary. Co. Lit. 8 a. So apples and other fruits growing at the death of the ancestor. Off. Est. 84. So roots, &c. within the soil. 9 Co. 89. So a coat-armour, penmons, tombstones, and monuments in a church, in the memory of whose ancestor they were set up. Co. Lit. 47 b. 625. 2 Vern. 151. An ancient horn, where the tenure is by cornage. 1 Vern. 273.

If a nobleman, knight, esquire, &c. be buried in a church, and have his coat of arms, and pennons with his arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made. See. 2 Vern. 520. And have his coat of arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made.

So apples and other fruits growing at the death of the ancestor; and memory of whose ancestor they were set up. 1 Inst. 18 b. An ancient horn, where the tenure is by cornage. 1 Vern. 273.

If a nobleman, knight, esquire, &c. be buried in a church, and have his coat of arms, and pennons with his arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made, &c. for a monument of him; in this case, albeit the freehold of the church be in the tomb be laid or made. See. 2 Vern. 520. And have his coat of arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made. See. 2 Vern. 520.

If the testator makes a specification of what goods and chattels go to the heir, viz. Goods and chattels annexed to the freehold go to the heir, and not to the executor or administrator: as, the glass in a window; the doors and locks of a house. 21 H. VII. 26 b. 4 Co. 63 b. So the worth, nails, and rails for an inclosure. 21 H. VII. 26 b. Furnaces, cupboards, and such furniture as is fixed to the houses; R. 21 H. VII. 26 b. unless they are severed in the lifetime of the testator. Som. 4 Sat. 368. So wainscot fixed to a house. 4 Co. 64 a. So pictures, glafes, &c. fixed instead of wainscot. 2 Vern. 508. So, millstones, &c. fixed to a mill.

So a term for years to attend the inheritance does not go to the executor, but to the heir. R. 2 Co. 136, 105. So deer in a park, coules in a warren, and doves in a dove-house, go with the inheritance to the heir. So, fish in a pond, or pycary. Co. Lit. 8 a. So apples and other fruits growing at the death of the ancestor; and memory of whose ancestor they were set up. Co. Lit. 47 b. 625. 2 Vern. 151. An ancient horn, where the tenure is by cornage. 1 Vern. 273.

If a nobleman, knight, esquire, &c. be buried in a church, and have his coat of arms, and pennons with his arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made. See. 2 Vern. 520. And have his coat of arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made. See. 2 Vern. 520.

So apples and other fruits growing at the death of the ancestor; and memory of whose ancestor they were set up. 1 Inst. 18 b. An ancient horn, where the tenure is by cornage. 1 Vern. 273.

If a nobleman, knight, esquire, &c. be buried in a church, and have his coat of arms, and pennons with his arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made, &c. for a monument of him; in this case, albeit the freehold of the church be in the tomb be laid or made. See. 2 Vern. 520. And have his coat of arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made. See. 2 Vern. 520.

If the testator makes a specification of what goods and chattels go to the heir, viz. Goods and chattels annexed to the freehold go to the heir, and not to the executor or administrator: as, the glass in a window; the doors and locks of a house. 21 H. VII. 26 b. 4 Co. 63 b. So the worth, nails, and rails for an inclosure. 21 H. VII. 26 b. Furnaces, cupboards, and such furniture as is fixed to the houses; R. 21 H. VII. 26 b. unless they are severed in the lifetime of the testator. Som. 4 Sat. 368. So wainscot fixed to a house. 4 Co. 64 a. So pictures, glafes, &c. fixed instead of wainscot. 2 Vern. 508. So, millstones, &c. fixed to a mill.

So a term for years to attend the inheritance does not go to the executor, but to the heir. R. 2 Co. 136, 105. So deer in a park, coules in a warren, and doves in a dove-house, go with the inheritance to the heir. So, fish in a pond, or pycary. Co. Lit. 8 a. So apples and other fruits growing at the death of the ancestor; and memory of whose ancestor they were set up. Co. Lit. 47 b. 625. 2 Vern. 151. An ancient horn, where the tenure is by cornage. 1 Vern. 273.

If a nobleman, knight, esquire, &c. be buried in a church, and have his coat of arms, and pennons with his arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made. See. 2 Vern. 520. And have his coat of arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made. See. 2 Vern. 520.

So apples and other fruits growing at the death of the ancestor; and memory of whose ancestor they were set up. 1 Inst. 18 b. An ancient horn, where the tenure is by cornage. 1 Vern. 273.

If a nobleman, knight, esquire, &c. be buried in a church, and have his coat of arms, and pennons with his arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made, &c. for a monument of him; in this case, albeit the freehold of the church be in the tomb be laid or made. See. 2 Vern. 520. And have his coat of arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made. See. 2 Vern. 520.

So apples and other fruits growing at the death of the ancestor; and memory of whose ancestor they were set up. 1 Inst. 18 b. An ancient horn, where the tenure is by cornage. 1 Vern. 273.

If a nobleman, knight, esquire, &c. be buried in a church, and have his coat of arms, and pennons with his arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made, &c. for a monument of him; in this case, albeit the freehold of the church be in the tomb be laid or made. See. 2 Vern. 520. And have his coat of arms, and such other ensigns of honour as belong to his degree, set up in the church, or if a grave-stone or tomb be laid or made. See. 2 Vern. 520.

So apples and other fruits growing at the death of the ancestor; and memory of whose ancestor they were set up. 1 Inst. 18 b. An ancient horn, where the tenure is by cornage. 1 Vern. 273.
so that the tail is spent, and C. enters, these lands shall be assets to answer the debt of his father. Carth. 127. The lands, as observed above, must descend to the heir; and therefore it was formerly held, that if he took by pur-
chase, as if the vendar devised them to him, paying so much, or if he devised lands to one of the two, and his heir descends to one, that the lands were not assets; but if he devised one part to A, another to B, and another to his heir at law, this third part was assets. Cro. Eliz. 451.

By the statute of frauds and perjuries, (29 Car. 1. c. 3.) it is enacted, that if lands come to the heir by reason of a special occupancy, they shall be chargeable in his hands as assets to satisfy his debts; and in case there be no special occupancy thereof, it shall go to the executors or administrators of the party that devised them, born in 1683 at Frankfort on the Maine, and in 1700, under Ruyffch and Rau. In the following year he attended as a surgeon in the Dutch camp in Brabant; and when it broke up, he pursued his medical studies at Leyden under Boerhaave and other eminent professors, and took his doctor's degree. He returned to the camp in 1708; and, in 1709 was appointed physician-general to the Dutch military hospital. In 1710, he was made professor of anatomy at Altdorf, and became celebrated by his lectures and writings. In 1720 he removed to the university of Helmstadt, and passed the remainder of his life. The czar, Peter, gave him an invitation to Russia; but he could not be prevailed on to quit Germany, where he enjoyed the esteem of several sovereigns. He died at the height of his professional acquirements, in 1758. In anatomy he was the author of a number of detached essays and observations; but his principal work in this department is his Compendium Anatomicum, first printed in 1717, and many times reprinted with successive additions, and translated into various languages. In surgery he became celebrated by being the author of another capital work, Institutions of Surgery, published first at German, 1718; translated into Latin by Frobenius, under the title of Instructio chirurgica, Anglo. 1739, 400, and many times edited in those languages, and in most of the European tongues. In medicine, his principal works are, 1. Observations Medicinae miscellaneae, theoricae & practicae, 400. 2. De Medicina Mechanica, praefat. 400. 3. Compendium Instructiionum & Fundamentorum Medicinae, 400. After his death, was published a Collection of Medical, Chirurgical, and Anatomical, Observations, 2 vols. 400.

HEISTER, f. [so named by Jacquin in honour of Laurence Heister, the subject of the preceding article.] In botany, a genus of the class decandria, order monogynia, natural order of holarrheas, (aurantia, Jaff.) The generic characters are—Calyx: perianthium one-leaved, bell-shaped, five-cleft, acute, small, permanent and covered with the seeds. Petals: petals five, ovate, acute, concave, spreading. Stamina: filaments ten, ovate, acute, flat, upright; alternately shorter; anthera roundifh. Pistillum: germ roundifh, flatt, ryle upright, short; stigma four-cleft, obtuse. Pericarpium: drupe oblong, flatt, at the tip; placed on a very large coloured calyx. Seed: nut oval, obtuse.—Essential Character. Calyx, five-cleft; petals, five; drupe with a very large coloured calyx. Heistera coccinea, a lingle species. It is an elegant branching tree, twenty feet in height. Leaves oblong, quite entire, drawing to a fickle-shaped point, shining, of a dark green, with short petioles, and allow eight to a leaf. Flowers small, peduncled, axillary, with white corollas; calyx in the flower small and green, in the fruit scarlet, with a very large spreading limb, and short, very blunt, roundish, segments. Native of Martinico, in clofe woods near torrents; flowering in February and March, and fruiting in June. The French inhabitants call it les perdis, but being very fruitful, within a very short time. HEITERNHEIM, o Heyterscheim, a town, and priory, and principality, of Germany, on the Upper Rhine.
Rhine. The town is ten miles south-east from Brieff.

HEL, a river of England, in the county of Cornwall, which runs into the sea about four miles south of Faithmouth.

HEL'LA, [Hebrew.] The name of a woman.

HEL'RAM, the name of a place mentioned at Sam. x. 16. probably the same with ELAM, which fee.

HEL'LAN, a town of Bohemia, in the circle of Leitmeritz, and south of Leitmeritz.

HEL'BAIL, a city of Palestine, belonging to the tribe of Asher. Judges, i. 31.

HEL'BIGS DORF, a town of Germany, in Upper Saxony, and circle of Erzgebirg; seven miles south of Freiberg.

HEL'CHA, the name of a place celebrated for its wine. Ezek. xxvii. 18.

HEL'CHE SAISTS, a sect of heretics, who had one Helchelauf for their ringleader, who held it was no sin to deny Jesus Christ in time of persecution. They also strongly opposed celibacy, and held it a duty of religion to marry.

HEL'COMA, s. [from θηκος. Gr. an ulcer.] With surgeons, the helcos, an ulceration.

HEL'CO'S, s. [Greek.] An ulcer.

HEL'CO'SIS, s. [Greek.] An ulceration; the state of a wound turning to an ulcer.

HEL'CY'DRIA, s. Small ulcers in the skin of the head.

HEL'DAZOON, s. A small island of Scotland, near the south coast of Shetland. Lat. 60. 13. N. Ion. 1. 30. E. Edinburgh.

HEL'DBURG, a town of Germany, in Upper Saxony, and principality of Coburg: eight miles west of Coburg.

HELE, the preterite and past. part. of hold.—A rich man beginning to fall, is held up of friends. Ezekiel.—If Minerva had not appeared and held his hand, he had executed his design. Dryden.

HELENOS, s. Small ulcers in the skin of the head.

HELEN, the name of a woman.

HELENS, the name of a woman. [to called from St. Helen, the mother of Constantine the Great, who built a church there.]

HELENS, a town of Bohemia, in the circle of Leitmeritz, seven miles south of Leitmeritz.

HELEN, or HEL'KA, the name of a woman.

HELEN'S HEAD, a place in Ireland.

HELENA, the most beautiful woman of her age, fabled to have sprung from one of the eggs which Leda, the wife of king Tyndar, brought forth after her amours with Jupiter metamorphosed into a swan. See the article Leda. According to some authors, Helen was daughter of Nemesis by Jupiter, and Leda was only her nurse; and to reconcile this variety of opinions, some imagine that Nemesis and Leda are the same person. Her beauty was so universally admired in her infancy, that Thebeus, with his friend Pithouos, carried her away before she had attained her tenth year, and concealed her at Aphidnae, under the care of his mother Aethra. Her brothers, Caflor and Pollux, recovered her by force of arms, and she returned to Sparta, her native country. There exiled, however, a tradition recorded by Paufanias, that Helen was of noble birth when carried away by Thebeus, and that she had a daughter by her ravisher, who was entrusted to the care of Clytemnestra. This violence offered to her virtue did not in the least diminish, but rather increased it, and her hand was eagerly solicited by the young princes of Greece. The most celebrated of her suitors were, Ulysses son of Laetes, Antilochus son of Neleus, Sthenelus son of Carpathus, Diomedes son of Tydeus, Amphiychus son of Crates, Menelaus son of Phileus, Agamemnon son of Mopsus, Acrisius son of Eurystheus, Meleager son of Perseus, Schizzus son of Epipheus, Polyxenus son of Aegisthus, Amphiychus son of Amphiychus, Acaulaphus and Ialmenus sons of the god Mars, Ajax son of Oileus, Bemucus son of Admetus, Polyphemus son of Pirithous, Elpenor son of Curtus, Cent and Machaon, Polydorus and Eumolpus sons of Zelcus, Menelaus son of Coronis, Philoctetes son of Peum, Protesilus son of Iphichus, Euryalus son of Elemon, Ajax and Teucer sons of Telamon, Patroclus son of Menelius, Menelaus son of Ateus, Thoas, Idomeneus, and Merion. Tyndarus was rather alarmed than pleased at the sight of such a number of illustrious princes who eagerly solicited each to become his son-in-law. He knew that he could not prefer one without displeasing all the rest, and from this perplexity he was at last drawn by the artifice of Ulysses, who began to be already known in Greece by his prudence and sagacity. This prince, who clearly saw that his pretensions to Helen would not probably meet with success in opposition to so many rivals, proposed to extricate Tyndarus from all his difficulties if he would promise him his niece Penelope in marriage. Tyndarus consented, and Ulysses advised the king to bind, by a solemn oath, all the suitors that they would approve of the unaltered choice which Helen would make of one among them; and engaging them together to defend her person and character if ever any attempts were made to ravish her from the arms of her husband. The advice of Ulysses was followed, the princes consented, and Helen fixed her choice upon Menelaus, and married him. Hermione was the early fruit of this union, which continued for three years with mutual happiness. After this, Paris, son of King Priam, interfered the rest, and the Greeks returned home without receiving the satisfaction they required. Soon after their return, their combined forces assembled, and sailed for the coast of Asia. The behaviour of Helen during the Trojan war is not clearly known. Some afferted that the had willingly followed Paris, and that she warmly supported the cause of the Trojans; while others believe that she always fled after her husband, and cursen the day in which she had proved faithless to his bed. Homer represents her as in the last instance, and some have added that she often betrayed the schemes of the Trojans, and secretly favoured the cause of Greece. When Paris was killed in the ninth year of the war, the voluntary married Deiphobus, son of the king of Troy, to follow him to Troy, in the year before Christ 1193. At his return, Menelaus, highly sensible of the injury he had received, assembled the Grecian princes, and reminded them of their solemn promises. They resolved to make war against the Trojans; but they previously sent ambassadors to Priam to demand the restitution of Helen. The influence of Paris at his father's court prevented the restitution, and the Greeks returned home without receiving the satisfaction they required. Soon after their return, their combined forces assembled, and sailed for the coast of Asia. The behaviour of Helen during the Trojan war is not clearly known. Some afferted that she had willingly followed Paris, and that she warmly supported the cause of the Trojans; while others believe that she always fled after her husband, and cursed the day in which she had proved faithless to his bed. Homer represents her as in the last instance, and some have added that she often betrayed the schemes and resolutions of the Trojans, and secretly favoured the cause of Greece. When Paris was killed in the ninth year of the war, the voluntary married Deiphobus, son of Priam's sons, and when Troy was taken she made no scruple to betray him, and to introduce the Greeks into his chamber, to ingratiate herself with Menelaus. She returned to Sparta, and the love of Menelaus forgave the errors which she had committed. Some however say that she obtained a life even with difficulty from her husband, whose resentment she had kindly by her infidelity. After she had lived for some years at Sparta, Menelaus died, and she was driven from Peloponnesus by Megapentes and Niceratus, the illegitimate sons of her husband; she then retired to Xanthus, where at that time Palyxo, a native of Argos, reigned over the country. Palyxo remembered her childhood, and the love of her childhood originated in Helen; and that her husband Telephus had been
been killed in the Trojan war, which had been caused by the debaucheries of Helen, therefore the meditated revenge. While Helen was at bathe in the river, Poly- 
lo dysvuher her attendants in the habitus of furies, 
and sent them with orders to murder her enemy. Helen 
was tied to a tree and strangled, and her misfortunes 
were afterwards remembered, and the crimes of Poly- 
lo dys exalted, by the temple which the Rhodians raised to 
Helen, or tied to a tree. There is a tradition, and was 
mentioned by Herodotus, with fays that Paris was Paris 
driven, as he returned from Sparta, upon the coast of 
Egypt, where Proteus, king of the country, expelled 
him from his dominions for his ingratitude to Menelaus, 
and confined Helen. From that circumfance, therefore, 
Priam informed the Grecian ambasadores that if he 
them her poffessions, he would to the hands of the king 
of Egypt. In spite of this affront the Greeks befieged the 
town, and took it after ten years siege; and Menelaus, 
by visiting Egypt as he returned home, recovered Helen at the court of Priam, and was 
convined that the Trojan war had been undertaken 
upon the unjust and unpar donable grounds. Helen 
was honoured after death as a goddess, and the Spartans 
built her a temple at Therapne, which had power of 
giving beauty to all the deformed women that entered 
it. Helen, according to fome, was carried into the island 
of Leuce after death, where the married Achilles, who 
had been once one of her warmeft admirers. The age of 
Helen is a matter of great enquire among the 
chronologistics. If she was born of the fame eggs as Caf- 
tor and Pollux, who accompanied the Argonauts in their 
expedition against Colichis about thirty-five years before 
the Trojan war, according to fome, she was no fels than 
fiy years old when Troy was reduced to ashes, sup- 
pofing that her brothers were only fifteen when they 
embarked with the Argonauts. But she is reprefented 
by Homer incomparably beautiful during the flege 
of Troy, that, though feen at a distance, fhe influeced the 
counfellers of Priam by the brightnefs of her charms; 
therefore we mufi fuppofe, with others, that her beauty 
remained long undiminifhed, and was extinguifhed only 
at her death.

HELE'NA, in ancient geography, an ifland on the 
coast of Attica, where Helen came after the flege of 
Troy. Pliny.

HELE'NA, mother of Conftantine the Great, faid to 
have been the daughter of an inkeeper of Drepanum in 
Attica. She attracted the notice of Conftantius Chlorus on one of his journeys; and their commerce termi- 
nated in marriage. It was a condition of the adoption 
of Conftantius by Maximan in 292, that he fhould dif- 
vorce his low-born wife, and take a fped with imperial 
blood. From this time Helen lived in obfcurity till the 
death of Conftantius, and the accession of her son Conftantine to the imperial throne. She had now the 
title of Augufia and empress at court, and in the armies; 
and the entire dispoal of a large revenue. She had the influence to keep from all public employments the three 
half-brothers of Conftantine; a conduct which the em- 
peror Julian dignifies as proceeding from the unjust 
artifice of a ftep-mother, while her enemifhis have im- 
plicated it to prudence and wise policy. About the year 
326, she paid a visit to the holy places of Jerusalem, and 
this was the epoch of that memorable event of ecclefi- 
atical history, called the invention of the true crofs. 
Having caufed a temple of Venus built over the fup- 
pofed holy lepulcher to be demolished, a ca- 
v翊 was discovered, in which were depofited three 
crofses, fuppoled to be thofe on which Chrifl and the 
two thieves fuffered. Helen, tranported with joy at the 
poffeffion of fuch a treasure, had one of them cut into two 
parts, the largelf of which he left with Macarius bishop 
of Tyre; and fent the other to heaven. In the poem of 
Eulobius in his Ecclefiatical history is ftitet concern- 
ing this great event, it is recorded by fo many other 
writers of grave authority, that the catholic church has 
made no fimple of commemorating it by a religious ser- 
vice. Helen remained in Palestine, and built a church, 
under the title of God, at Bethlehelm, and ano- 
other on the mount of Olives. She alfo fhowed her 
wealth liberally upon the poor, and the religious 
communities; and then made a progress through the princi- 
pal churches of the East, every-where signaling her 
pity and munificence. She died at the age of eighty, 
and confined Helen. From that circumfance, therefore, 
Priam informed the Grecian ambasadores that if he 
them her poffessions, he would to the hands of the king 
of Egypt. In spite of this affront the Greeks befieged the 
town, and took it after ten years siege; and Menelaus, 
by visiting Egypt as he returned home, recovered Helen at the court of Priam, and was 
convined that the Trojan war had been undertaken 
upon the unjust and unpar donable grounds. Helen 
was honoured after death as a goddess, and the Spartans 
built her a temple at Therapne, which had power of 
giving beauty to all the deformed women that entered 
it. Helen, according to fome, was carried into the island 
of Leuce after death, where the married Achilles, who 
had been once one of her warmeft admirers. The age of 
Helen is a matter of great enquire among the 
chronologistics. If she was born of the fame eggs as Caf- 
tor and Pollux, who accompanied the Argonauts in their 
expedition against Colichis about thirty-five years before

HELÉNEUS, a celebrated soothsayer, son of Priam and Helen, greatly respected by the Trojans; and when Deipheus, the first of Priam's sons, given in marriage to Helen in preference to himself, resolved to leave his country, and retired to Mount Ida, where Ulysses took him prisoner by the advice of Chalcas. As he was well acquainted with futurity, the Greeks made use of prayers, threats, and promises, to induce him to reveal the secrets of the Trojans; and either the fear of death or gratification of curiosity seduced him to disclose to the enemies of his country. — See HELÉNER.

HELÉNBERG, a town of Germany, in the archbishopric of Magdeburg.

HELÉNE, [Hebrew.] A man's name.

HELÉNÉS, in ancient geography, a river of Lucania, near Veii.

HELÉTZ, [Hebrew.] A man's name.

HELÉNÉS, or downy helénium: leaves pubescent. This also is native of North America; it was introduced into England in 1776 by Mr. William Malcolm, and flowers in August and September.

Propagation and Culture. They may be propagated by seeds, or by parting their roots; but the latter is generally practiced in this country, because they seldom perfect their seeds here; but, if the seeds are procured from abroad, they should be sown the beginning of March on a border of light earth; and, if the seeds should not come up the first year, the ground should not be disturbed, because they often remain a whole year in the ground before the plants come up; in which case there is nothing more to be done, but to keep the ground clear from weeds, and wait until the plants rise. When they appear, they prove dry and brittle, which will greatly forward their growth; and where the plants come up too close to each other, they should be thinned, and transplanted out into beds a foot or more apart every way, being careful to make them shallow, which will continue till the fruit prevents them; and their roots will abide many years, and afford many offsets, by which they may be increased. The best season to transplant the old roots, and to part them for increase, is in the end of October, when their flowers are faded, or the beginning of March, just before they begin to shoot; but, if the spring should prove dry, they must be duly watered, otherwise they will not produce many flowers the same year. These plants should not be removed oftener than every other year, if they are expected to flower strongly; they delight in a soil rather moist than dry, provided it be not too strong, nor hold the wet in winter; but if they are planted in a dry soil, they must be often and plentifully watered in dry weather, to make them produce plenty of flowers. See INULA and HELIANTHUS.

HELÈReLUES, a celebrated soothsayer, son of Priam and Helenba, greatly respected by the Trojans; and when Deipheus, the first of Priam's sons, given in marriage to Helen in preference to himself, resolved to leave his country, and retired to Mount Ida, where Ulysses took him prisoner by the advice of Chalcas. As he was well acquainted with futurity, the Greeks made use of prayers, threats, and promises, to induce him to reveal the secrets of the Trojans; and either the fear of death or gratification of curiosity seduced him to disclose to the enemies of his country, that Troy could not be taken whilst it was in possession of the Palladium, nor before Polydeuces came from his retreat at Lemnos, and assisted to support the siege. After the ruin of his country, he fell to the share of Pyrrhus the son of Achilles, and saved his life by warning him to avoid a dangerous tempest which in reality proved fatal to all those who fled. This endeared him to Pyrrhus, and he received from his hand Andromache the widow of his brother Hecutor, by whom he had a son called Celifrinos. This marriage, according to some, was consummated after the death of Pyrrhus, who lived with Andromache his wife. Helenus was the only one of Priam's sons who survived the ruin of his country. After the death of Pyrrhus, he reigned over part of Epirus, which he called Chaonia in memory of his brother Chaun, whom he had inadvertently killed.

Helenus received Aeneas as he voyaged towards Italy, and foretold him some of the calamities which attended his fleet. The manner in which he received the gift of prophecy is doubtful. Virg. Aen. iii. 295. &c.

HELÉPH, a city of Palestine, belonging to the tribe of Naphtali: situated upon the boundaries of that tribe. Jef. xv. 8.

HELÉPOLIS, f. in the ancient art of war, a machine for battering the walls of a place besieged, the invention of which is ascribed to Demetrius Poliorcetes. Diodorus Siculus says, that each side of the Helepolis was 425 cubits in breadth, and 90 in height; that it had nine gates, and was moved on four strong wheel-like sulphur columns in diameter, and was armed with large battering rams, and had two roofs capable of supporting them; in that lower gates there were different sorts of engines for casting stones; and in the middle they had large catapults for discharging arrows, and smaller ones in those above, with a number of expert men for working these machines. — See the article Artillery, vol. ii. p. 234, and the correspondent engraving.

HELÉREL, f. [from helan, Sax. to cover.] A tile, thatcher, or flater. — In the west he that covers a house with flates is called a heler or hellet. Ray.

HELÉLY, in ancient geography, a river of Lucania, near Veii.

HELÉLZ, [Hebrew.] A man's name.

HELÉNÉNBERG, a town of Germany, in the archbishopric of Magdeburg.

HELÉNÉCAL, adj. [heléca. Fr. from ἰδέα, Gr.] Emerging from the lute of the fun, or falling into it. — In the old days of the ancients, when the heliacal rising of a star or planet, is that which is veiled from the sun, or at the same time, as the sun; and heliacal setting, the same as the setting with the sun. Or, a star rises heliacally, when, after it has been in conjunction with the sun, and becomes invisible, it gets at such a distance from him as to be seen in the morning before the sun's rising. And it is said to set heliacally, when it approaches to near the sun as to be hid by his beams. So that, in truth, the heliacal rising and setting are only an apparition and our invention.

HELÉNÉCALLY, adv. — From the rising of this star, not comically, that is, with the fun, but heliacally, that is, at its emergence from the rays of the sun, the ancients computed their canicular days. — Brown.

HELÉNÉDES, in mythology, the daughters of the Sun and Clymene. They were three in number, Lampetie, Phaethi, and Lampethi; or seven according to Hyginus; Meropée, Helle, Ægle, Lampetie, Phoebe, Ætheia, and Dioxippe. They were so afflicted at the death of their brother Phaeton, that the gods, moved with compassion, changed them into poplars, and their tears into precious amber, on the banks of the Po. Ovid. Helíandes was also the name of the first inhabitants of Rhodes. This island, being covered with mud when the world was first created, was warmed by the cherishing beams of the sun, and from thence sprang seven men, which were called Helianides, and two more, from the sun. The eldest of these, called Ochimus, married Hegetor, one of the nymphs of the island; and his brothers fled from the country for having put to death, through jealousy, one of their number. — Dioscorus.

HELÉNA, in Grecian antiquity, the great court in Athens for the trial of civil causes. — See HELIASTE.

HELÉNANTHEMOPDES, see TURNERA.

HELIANTHEMUM,
HELIA NTHE MUM, s. in botany. See CISTUS, PORTULACA, TURNERA.

HELIA NTHUS, s. from ΣΔΑΙΟΝ, Gr. the sun, and ΦΛΟΡΗ, a flower.] The Sun-flow er; in botany, a genus of the class synoeci, order polygymma, family of the natural order of composite oppositifoli, (corymbiher, Judy.) The generic characters are—Calyx: common imbricate, somewhat squarrose, expanded; scales oblong, broad at the base, gaping everywhere at the ends. Corolla: compound radiate; corollas hermaphrodite, or with numerous opposite disc; receptacle much longer in the ray. Proper: of the hermaphrodites cylindrical, shorter than the common calyx, bellying at the base, oribicular, depressed; border five-toothed, tharpy, spreading; of the neuter ligulate, lanceolate, quite entire, very long. Stamens: in the hermaphrodites; filaments five, curved, inserted below the belly of the corollas, the length of the tube; anthers cylindrical, tubular. Peli fillum: in the hermaphrodites; germin oblong; style filiform, length of the corollas; stigma two-parted, reflex. In the neuter: germ very small; style and stigmas none. Pericarpium: none; calyx unchanged. Seeds: in the hermaphrodities solitary, oblong, blunt, four-cornered and complicated, the rays of opposite angles; the inner ones narrower, crowned with two lanceolate, acute, deciduous chafts; in the females none. Receptaculum: chaffy, large, flat; chaffs lanceolate, acute, two separating each seed, deciduous.——Essential Character. Calyx, imbricate, somewhat squarrose; down two-leaved, receptacle reflex. 

Species. 1. Helianthus annuus, or annual sunflower: all the leaves cordate, three-nerved; peduncles thickening; flowers drooping. Root annual. Stem single or branched, from five or six to ten or fourteen feet in height; and in hot climates twenty or more; when vigorous, the size of a man's arm. Leaves alternate, a span or a half in length, and almost as much in breadth; rough, serrate, acuminate, hanging down at the end. Peduncles long, broad at the base, gaping everywhere at the point, one would suppose that it had been known here in the time of queen Elizabeth. Our ancestors boiled them tender, and then, being peeled, ate them sliced and flewed with butter, wine, and spices; thus, says Parkinson, they were a dish for a queen, being as pleasant as the bottom of an artichoke; but the too frequent use, especially being so plentiful and cheap, hath rather bred a loathing than a liking of them. They also baked them in pies, with marrow, dates, ginger, raisins, sack, &c. This root probably got into discourse from a notion of its flatulent quality. The potato seems to be more nutritious and wholesome; it is not necessary therefore now to enforce the cultivation of Jerusalem artichoke as a general article of food. However, the tuber is more agreeable variety at good tables. There is no better vegetable for its common English name, than that the root, when boiled, has the taste of an artichoke bottom; Parkinson therefore would have it called potatoes of Canada, because the French brought them first from Canada into these parts. Not that Canada is their original country, for they are unquestionably the produce of a hot climate, being natives of Brazil.

2. Helianthus decapetalus, or ten-petalled sunflower: stem smooth at bottom; leaves lanceolate-cordate, three-nerved; ray of the flower ten-petalled; peduncles fleshy. This resembles H. multiflorus, or common perennial sunflower, very much, but it does not increase in the same manner; the chief, which scarcely attains the height of a man, is fleshy, but smooth at bottom. Native of Canada.

3. Helianthus Indicus, or dwarf annual sunflower; all the leaves cordate, three-nerved; peduncles equal; calyxes lefs. This perhaps the same as the foregoing, though conffant; but the leaves are convex above in the disk, and of a darker green. The peduncles are less thickened at top, or rather of an equal thickeness every where, whence the flowers nod less. We do not know the native country of this, but there is little doubt of its coming from Mexico or Peru. Linneas says that it is cultivated in Egypt. It grows only from eighteen inches to three feet in height.

4. Helianthus multiflorus, or perennial sunflower; leaves ovate-cordate, three-nerved; stem of the same; produced before 1699, by William Forman lord Lemster. This is allied to the foregoing species.

5. Helianthus tuberosus, or tuberous-rooted sunflower; flower-stems are lefs thickened at top, or rather of an equal thickness everywhere, whence the flowers nod less. Native of Mexico or Peru.
8. Helianthus giganteus, or gigantic sun-flower; leaves alternate, lanceolate, scabrous, ciliate at the base; stem stiff, scabrous. Stem ten feet high, green, hirsute, and much ramifying. It begins flowering in July, and continues till October; there is a variety of this with very double flowers, which is now become so common in the English gardens, as to have almost banished the single sort from hence.

They are all very hardy, and will grow in almost any soil or situation; they are propagated by parting their roots into small heads, which in one year's time will spread and increase greatly. The best season for this work is in the middle of October, soon after the frosts are past, or very early in the spring, that they may be well rooted before the droughts come on; otherwise the flowers will be few in number, and those small. Sow them early, and by this means their roots will be well; but, if they are planted in October, you will have the trouble of watering them; their roots being firmly fixed before the dry weather, they will need no other trouble than to clear them from weeds.

The Jerusalem artichoke is cultivated for the roots, which are by some people much esteemed. These are propagated by planting the smaller roots, or the larger ones cut in pieces, observing to preserve a bud to each separate piece, either in the spring or autumn, allowing them a good distance, for their roots will greatly multiply; the autumn following, when their stems decay, and the roots may be taken up for use. They should be planted in some remote corner of the garden, for they are very unightly while growing, their roots over-run the ground, and from their great height are apt to be blown down. They may be taken up for present use in September, and the whole crop may be hauled in October. If kept in sand in a dry place, they will continue the whole winter.

HELITHUS LÆVIS. See BUPHTHALMUM HELLANTHIDES.
HELI'COID PARAB'OLA, or the Parabolic Spiral, judicial to the liberty or to the union of the people of Athens. Will not seek those persons who may propose a reduction of private debts, or a distribution of the lands or houses of the Athenians. I will not recall exiles, nor endeavour to procure a pardon for those who shall be condemned to die. Nor will I force those to retire whom the laws and the suffrages of the people shall permit to continue in their country. I will not give my vote to any candidate for a public function who gives not an account of his conduct in the office which he has previously filled; nor will I presume to solicit any trust tire whom the laws and the suffrages of the people Shall exiles, nor endeavour to procure a pardon for those who

Athens. I will not second those persons who may pro-

will not accept any present, either myself or by another, permitting to remain in their country. I will not give my

neighbourhood of Parnassus and Cytheron, Sacred to

monly swet; and the inhabitants affirmed, that the

Helicon was one of the most fertile and woody moun-
tains in Greece. On it the fruit of the adrachnus, a

mountain in loftiriefs, extent, and magnitude. Here was

was that consecrated by Heiiod. On the left-hand side to the grove was the fountain Aganippe, and about twenty rods, or two miles and a half, higher up, the

violet-coloured Hippocrene. Round the grove were houses. A festival was celebrated there by the Thebians, with games called Myaces. The valleys of Helicon are described by Wheler as green and flowery in the spring; and enlivened by pleasing cascades and streams, and by fountains and wells of clear water. The Boeotian cities in general, two or three excepted, were reduced to considerable villages. The grove of the Muses was plundered under the auspices of Constaantine the Great. The Heliconian goddesses were afterwards confumed in a fire at Constatinepolis, to which city they had been removed. Their ancient seats on the mountain, Aganippe and Hippocrene, are unfinished.

HEL'ICONIA, f. [Helicon'ia, from Hel'icon, a mountain in Boeotia, the Muses were called Elagizas, from one of these.] In botany, a genus of the class pentandria, order monogynia, natural order of scitamineae, (mufe, fef.) The generic characters are—Calyx: spathes common and partial alternate, diffusil, with hermaphrodite flowers; perianthium none. Corolla: petals three, oblong, channelled, crect, acute, equal; nectary two-leaved, one leaflet nearly equal to the petals, the other very short, channelled, hooked, opposite. Stamina: filaments five, (or six, Adamson,) filiform; anther long, crect. Petilillum: germ inferior, oblong; style slenderer than the flamen; stigma long, slender, curved, with a terminating apical point. Pericarpium: capsule oblong, truncate, three-fiided. Seeds: solitary, oblong.—This genus is diiferent from Muyia by a tricoccous capsule; but it is still doubtful whether it should not be transferred to the clafs hexandria.—Essential Character. Perianthium none; corolla three-petalled, (irregular, Sc.) nectary two-leaved; pericarpium tricoccous; seeds solitary; (capsule fleshy, three-ctided, Sc.)

Species, 1. Heliconia bihai, or bastard or wild plant: leaves and spadix radical; spathes dillicif, coro-
date; nectary ventricos, bifid at the tip. This is a

very large herbaceous plant, from ten to twelve feet in height. Leaves oblong, narrower at both ends, entire, marked with parallel lines, crect, thick, and very smooth. Spadix simple, upright. Common spathes eight to ten, rigid, corarde, embrasing, from erect spreading, acuminate, diffusif, yellowish brown. Flowers in bundles concealed within each spathe; partial spathes membraneous, whisht, the length of the flowers, which are white, bluish, or purple. This species is doubtless a native of Jamaica, and thrives very luxuriously in every rich and well-shaded gulley among the woods. The younger Linnceus, in the Supplement Plantarum, has confounded these plants under the name of Heliconia bihai; namely this, Strelitzia reginae, to which the specific difference and description there given belong, and Heliconia, or rather Strelitzia, alba.

2. Heliconia pittacorum; leaves on the stem rounded at the base; spadix terminating, flexuofus; spathes lanceolate; nectary lanceolatet, concave, entire. This plant bears a great resemblance to Canna, and grows to the height of eight feet, with a simple smooth leaf. Spathes four to six, alternate, diffusif, somewhat remote, divaricated, two inches long, theathing at the base, acutte, coloured blood-red, many-flowered. Native of Jamaica, in wet parts of the woods, on the highest mountains; and in several parts of South America.

Heliconia hirsuta, at the base, simplo nerved, very smooth; inflorifcence hirsute; spadix flexuofus; nectary lanceolatet, adnate. In stature and leaves this resembles the other species: the pericar-
pium is the same with that of H. pittacorum, only hirsut. Found in South America by Mutis. See Stre.

HEL'ICONIAN, adj. Belonging to mount Helicon; belonging to the famous fountain of the foot of Helicon.

HEL'ICONIADAS,
HELIConI'ADES, or Heliconi'ides, a name given to the Moths, because they lived upon mount Helicon, which was sacred to them.

HELIcOSOPHY, f. [HEL, Gr. a spiral, and σόφη, wisdom.] The act of delineating spiral lines on a plane.

HELIcERES, f. [HEL, Gr. spiral; from the form of the fruit.] In botany, a genus of the class gynaecandria, order decandria, (Gynaecandria monogynia, Schreber, monadelphus, natural order of columnifere, (malvaceae, fimplicifere, (malvaceae, natural order of columnifere.) The generic characters are—

Calyx: perianthium one-leaved, tubulous, half-ovate, obliquely spreading, unequally five-leafed, coriaceous. Corolla: petals five, oblong, equal in breadth, fixed to the receptacle, longer than the calyx; claws long, with an acute point; tube at the base; nectary of five petal-shaped, lanceolate, very small, leaflets, covering the germ. Stamina: filaments five, ten, or more, very short; antherae oblong, lateral. Pistillum: receptacle filiform, very long, bowed back, bearing an ovate germ at the tip; style furcate, longer than the germ; stigma sub-acute; petals five; nectary of five leaflets; capsules five, twisted.

Species. 1. Helicéteres baronii, or small-fruited screw-tree; decandrous; leaves cordate, serrate, fruit twisted. This is a native of Carthagena, thence it is said to have been brought to Europe. It is a shrub or tree, about twelve feet in height, branching but little; the younger branches, peduncles, and petioles, are tomentose. Leaves acute, wrinkled, tomentose and whitish underneath, somewhat hairy on the upper surface, petiolate, entire, deciduous. The flowers have no scent; calyx greenish yellow, with a white excavation, and lips sometimes entire or scarcely divided; petals whitish. Seeds about fifty in each capsule, obovate, angular, smooth, of a brown chestnut colour. The bark of the trunk and branches, when cut, exudes a strong perfume. The flowers have no scent; calyx four-leaved; corolla four-petalled; both are of a brown chestnut colour.

2. Helicéteres ifora, or great-fruited screw-tree; decandrous; leaves cordate, serrate; the whole fruit twisted; (leaves elliptic, subcordate; fruit furcate at the tip.) This is a small upright tree, about twelve feet high, branching but little. This curious shrub, as Browne calls it, is very frequent in the low gravelly hills of Jamaica. It is a native of Cochin-china, in woods.

3. Helicéteres hirsuta; decandrous; leaves cordate, serrate; fruit five-leafed, straight, very hirsute. Stem hirsute, six feet high, upright, round, hairy, with diffused branches. In this and the fifth sort the Itamens ought the pedicel supporting the germ to be looked upon as a receptacle, for it is entirely detached from the flaments. Native of Cochin-china, in woods.

4. Helicéteres undulata; decandrous; leaves lanceolate, waved; flowers in heaps; filiques five, sessile. This is a mounding-tied tree with spreading branches. It is a native of Cochin-china, in woods.

5. Helicéteres angustifolia; decandrous; leaves lanceolate, quite entire; fruit ovate, straight. Stem hirsute, five feet high, upright, branched. Flowers pale purplish. Native of China, about Canton.

6. Helicéteres pentandra; pentandrous; leaves ovate, floral leaves coloured. Native of Surinam.

7. Helicéteres semigynaecandria; polyandrous; leaves cordate, serrate; fruit oblong, straight. An upright tree, about twelve feet high. Leaves tomentose on both sides. Flowers extremely fetid, generally coming out with the leaves, but sometimes before them; calyx brownish yellow; petals purple. It has so much the habit of a tree, that it is said to have been planted from it, except in the flower and fruit. Native of Carthagena in New Spain, in woods; flowering there in June and July.

8. Helicéteres paniculata; polyandrous; leaves ovate, acute; flowers panicled; filiques five, sessile. This is a small tree, with spreading branches. Leaves hirsute, flat, smooth, petiolate. Flowers in loose panicles, mostly terminating; calyx none; corolla of a reddish colour, and spreading very much. Native of Cochinchina, in woods.

9. Helicéteres apetalas; dodecandrous, apetalous; leaves five-lobed; filiques divergent. This is a large tree, forty feet in height, with a large handsome head. Leaves plaited, smooth above, subfoliaceous below, upwards of an foot in diameter. Flowers numerous, very red, dirty yellow with purple spots, without either petals or nectary; in large loose panicles at the ends of the twigs. It is apparent that the filaments are the continuation of the bark or outer part of the receptacle; but that the germ springs from the pith of it. Native of Carthagena, in woods; flowering from May and June to September.

Propagation and Culture. These plants are propagated by seeds, which must be sown upon a hot-bed in the spring; and when the plants are come up strong enough to remove, they should be each planted in a separate small pot, filled with light earth, and plunged into a moderate hot-bed of tan, observing to shade them from the sun till they have taken new root; then they should be treated in the same way as other tender plants from hot countries, raising the glasses every day in proportion to the weather, that the plants may enjoy the sun; the pots must be treated in the same way as other tender plants from hot countries, raising the glasses every day in proportion to the weather, that the plants may enjoy the sun; the pots must be removed, they should be each planted in a separate flower bed, where they should always remain, being careful to shift them into larger pots when they require it, and not give them too much water in the winter; but in summer they should have a large share of air in warm weather, and require to be often refreshed with water; the second year from the seeds these plants have often flowered in the Chelsea garden, and the seeds have some years ripened there, but the plants will live several years with proper management.

HELIocarpus, f. [from Helios, Gr. the sun, and καρπος, fruit, which, being surrounded with rays, resembles the sun as it is commonly represented.] In botany, a genus of the class dodecandria, order digynia, natural order of columnifere (tiliacae, fimplicifere.) The generic characters are—Calyx: perianthium four-leaved; corolla four-petalled; (style fimple; filique two-celled, compressed, longitudinally radiated; filique five, stellate.) Petal the same; nectary five, linear, broadish, spreading, deciduous. Corolla: petals four, linear, much shorter than the calyx, narrower. Stamina: filaments fifteen, awl-shaped, almost the length of the calyx; antherae twin, linear, incumbent. Pistillum: germ roundish; styles two, simple, upright, length of the calyx. Pericarpium: capsule turbinate-ovate, peduncled, compressed surrounded perpendicularly on both sides with rays pinnately branched; two-celled, two-valved, with the partition contrary. Seeds: solitary, subovate. Essential Character. Calyx four-leafed; corolla four-petalled; style simple; filique two-celled, compressed, longitudinally radiated; filique five, stellate,下行, (stellate, compressed surrounded with filiform feathered rays.)

Heliocarpus Americana, or American heliocarpus, the only species known, rises with a thick, soft, woody, flaky, from fifteen to eighteen feet high, sending out several lateral branches towards the top. Leaves heart-shaped, full of veins, serrate, ending in acute points, alternate, on oblique petioles three inches long. The flowers are produced at the ends of the shoots, in branching clusters, and are of a yellowish-green colour. This tree is very nearly allied to Trimictia. The calyx is four-leafed, and the corolla four-petalled; both are of a white colour, with ten filicous rays. It was discovered by Dr. Houffoun (before 1733), growing naturally about L2 Vera Cruz in New Spain, whence he sent the seeds to England.
Corolla: four-petalled, cruciform; petals roundish, flat, deciduous; the two outer ones bladdery at the base.

Tany, a genus of the class tetradynamia, order (iliquofa, proving the micrometer, which was communicated to the Royal Society in 1743, Mr. Savery discovered a similar method of using the same eye-glass and micrometer. By the same eye-glass serves for both. The tube, of this instrument was infected by M. Bouguer, in 1747; and is a kind of telescope peculiarly adapted for measuring and observing the sun, without assisting the eye.

Heliocentric Place of a Planet, the place in which a planet would appear to be when viewed from the sun; or that point of the ecliptic in which a planet viewed from the sun would appear to be. And the heliocentric place coincides with the longitude of a planet viewed from the sun.

Heliocentric Latitude of a Planet, the inclination of the line drawn between the centre of the sun and the centre of a planet, to the place of the ecliptic. The greatest heliocentric latitude is equal to the inclination of the planet's orbit to the plane of the ecliptic.

HELICOMETRÉS, f. A phenomenon sometimes observed at the sunset or rising of the sun, consisting of a large column of light, fixed or hung to that luminary, and drawing after it at its setting, like the tail of a comet.

HELIDORUS, a native of Emesa in Phoenicia, and bishop of Trica in Thessaly; flourished under the emperors Theodosius and Arcadius, at the close of the fourth century. In his youth he composed a romance in Greek and Latin, entitled "The Loves of Theagenes and Charicles." It is an ingenious and pleasing composition, and has served as a model for subsequent works of a like kind. A manuscript of this piece was found by a soldier at the sack of Buda, and was printed at Bafil in 1534. A translation of it was made by a Polish knight, and an edition of both, with the learned notes of Bourdelot, was printed at Paris in 1619, 8vo.

HELIDORUS OF EARISSA, a Greek mathematician, who flourished in the reign of the emperor Tiberius. He was the author of a treatise on optics, of which a fragment was published at Florence, in Greek and Latin, in 1630, and an Italian translation of the same by Ignatius Danti, with his edition of Euclid's Optics. The same piece was inspected by Dr. Thomas Gale, in his "Opuscula Mythologica." But the most complete edition of Heliodorus's Optics was published at Paris, in Greek and Latin, in 1635, 4to, with notes by Bartholin. Among the manuscripts of Isaac Vossius was a Treatise on Weights and Measures, supposed to be written by this author.

HELIAGBALUS, a proligate Roman emperor. See the article Rome.

HELIOGRAPHIC, adj. Pertaining to the description of the sun.

HELIOGRAPHY, f. [from ἥλιος, Gr. the sun, and γράφειν, to describe.] A description of the sun.

HELIOMETÉRÉ, f. An instrument for measuring the diameters of the sun, moon, and stars. It was invented by M. Bouguer, in 1747; and is a kind of telescope, consisting of two object-glasses of equal focal distance, placed by the side of each other, so that the same eye-glass serves for both. The tube of this instrument is of a conical form, larger at the upper end, which receives the two object-glasses, than at the lower, which is furnished with an eye-glass and micrometer. By the construction of this instrument two distinct images of an object are formed in the focus of the eye-glass, whose distance, depending on that of the two object-glasses from one another, may be adjusted with great precision. Mr. Savery discovered a similar method of improving the micrometer, which was communicated to the Royal Society in 1743.

HELIOPHILA, f. [from ἥλιος, Gr. the sun, and φιλέω, a friend; these plants being fond of sun-flame.] In botany, the class containing, under the order filifoplia, the natural order of silifoidæ, (cruciées, f.) The generic characters are—Calyx: perianthium four-leaved; leaflets spreading, oblong, concave, membranaceous at the edge, deciduous; the two outer ones bladder at the base. Corolla: four-petalled, cruciform; petals roundish, flat, fessile; nectaries two from the receptacle, bowed towards the calyx. Stamina: filaments fix, awl-shaped, erect, the length of the calyx, two opposite a little shorter; antherae oblong, erect, filiform; germ cylindrical; style shorter than the germ; stigma blunted. Pericarpium: silique roundish, pointed at both torulose, mucronate, two-celled, two-valved. Seeds: few. —Sec. 1. Heliophila integrifolia, or whole-leaved heliophila: leaves lanceolate, undivided. Stalk erect, four or five inches high, sending out two or three fertile branches. Leaves rough with hairs on the upper surface, smooth underneath. The flowers grow in a loose terminating bunch, and have no scent. The corolla resembles that of flax, or Anagallis monelli; is blue, and closes at night. The pods are near three inches long, taper, and contain a double row of flat seeds.

Heliophila coronopifolia, or buck's-horn-leaved heliophila: leaves linear, pinnatifid. This is a smooth plant. It grows about the same height with the other, but branches more. The flowers are like those of the foregoing, coming out from June to October.

Heliophila amplicaulis: leaves rem-claping, entire, smooth; silique necklace-shaped. Found at the mouth of Good Hope, with most of the other forts, by Thunberg.

Heliophila incana, or hoary heliophila: leaves spathulate, quite entire, pubescent; silique villose. Shrub; flowering in May and August.

Heliophila filiformis, or divaricated heliophila: leaves subulate, filiform, smooth; silique pendulous; branches divericate. Annual. Stem half a foot high, herbaceous, rusty; branches upright, shorter. It flowers in July and August.

Heliophila pubilla, or dwarf heliophila: leaves linear, silique necklace-shaped, upright. Annual. A plant high, upright, branched. Leaves linear; stems shrubby, rusty. Shrubby, having the appearance of broom, upright, sparingly branched, stiff. It is doubtful whether this be a natural species of this genus.

Heliophila circinoides: leaves cordate. It is described by Thunberg, under the name of Chenistra corona.

Heliophila digitata: leaves palmate-pinnatifid, villose; pinnas linear. The stem thickens very much upwards, which gives this plant a singular appearance.

Heliophila pinnaea: leaves trifid and pinnate; leaflets linear; silique necklace-shaped, upright. This resembles the fifth species very much, but it has branchlets for pinnate leaves.

Pagation and Culture. The seeds may be sown in the spring on a foot border, and when the plants come up, if they are thinned and kept clean from weeds, it is all the culture they require. They are all natives of the Cape.

HELIOPHÔBI, a name given to the white negroes or albino's, from their natural averseion to the light of the sun. See the article Albino, vol. i. p. 249, and the correspondent engraving.

HELIOPOLIS, or Aven, mentioned by Ezek. xxx. 17, and called by Moses On and in Jeremiah Bethfon, a city of Egypt, to the south-east of the Delta, and east of Memphis; where Pharaoh placed the temple of the sun, held in religious veneration. It gave name to the city Helipolis. See the article Egypt, vol. vi. p. 353.—There was another Helipolis in Cœle Syria, near the springs of the Oronites; so called from the worship of the sun, which prevailed over all Syria.

HELIOS, [Gr. ] In mythology, the son of Cœlus and Eos; the Sun. He was the god of the day, held in religious veneration.

HELIOCÓPS, f. A telescope peculiarly adapted for viewing and observing the sun without affecting the eye. There are various kinds of them, usually made by employing coloured glasses for the object or eye-glasses, or both. The same purpose is effected by a piece of glass blacked, by
by holding it over the smoke or flame of a lamp or candle; it first suggested by the celebrated Huygens.

Heliostis, f. from Gr. helios, the sun.] Infolation, or heating the body by the sun.

Heliostata, f. an instrument invented by Dr. Gravesande; and thus called from its property of fixing the sun's beam in one position, viz., in a horizontal direction across the dark chamber while it is used.

Heliotropis, f. in botany. See Heliotropium.

Heliotropium floribundum, f. See Tournefortia.

Heliotropium, f. from the Gr. helios, the sun, and tropos, a turn. 1. Brown's Heliotrope, a large annual, more than two feet high, because the leaves or flower were supposed to turn with the sun; hence the French name tourfola; or because it flowered about the summer solstice.] Turnsole; in botany, a genus of the class pentandria, order monogynia, natural order of apetaliae, (borageae, jussii.) The generic characters are—Calyx: perianthium one-leaved, tubular, five-toothed. Corolla: monopetalous, filver-shaped; tube the length of the calyx: border flat, half-five-cleft, obtuse; clefts smaller, alternate, more acute, between the larger ones; throat naked. Stamens: filaments five, very short, in the throat; antherae small, covered. Filamentum: germs four; style filiform, length of the filaments; stigma emarginate. Pericarpium: none; calyx erect, unchanged, arching over the seeds. Gertia: none; ovary four, ovate, acuminate; fruits four, naked or corticate, not perforate, &c.—Essential Characters. Corolla: filver-shaped, five-cleft, with teeth interposed; throat closed with arches.

Species. 1. Heliotropium Peruvianum, Peruvian turnsole or heliotrope: leaves lanceolate-ovate, item shrubby. Native of Peru. No. 5, with more slender branches, somewhat lanuginous, and prostrate; the root short and annual. Flowers white. Seeds usually one or two only, the rest being abortive; larger and more oblong than in the common form, brown, and covered with a bark. Native of the Cape of Good Hope; flowering in June and July.

3. Heliotropium Europaeum, European turnsole or heliotrope: leaves ovate, quite entire, tomentose, platied, fpike solitary. This is smaller than the common form, No. 5, with more slender branches, somewhat lanuginous, and prostrate; the root short and annual. Flowers white. Seeds usually one or two only, the rest being abortive; larger and more oblong than in the common form, brown, and covered with a bark. Native of the Cape of Good Hope; flowering in June and July.

4. Heliotropium inundatum: leaves oblong, obtuse, hirsute; spikes in four, erect; item shrubby. Native of the Caribee Islands.

5. Heliotropium Europaeum, European turnsole or heliotrope: leaves ovate, quite entire, tomentose, wrinkled, spikes conjugate. This rises about seven or eight inches high, dividing into two or three branches. Flowers white, appearing in June and July. There is a variety, with the flowers larger, and sweet.

6. Heliotropium Malabaricum: leaves ovate, plaited, striate, quite entire, spikes almost solitary. Burman has figured this as a variety of the foregoing species; it is easily distinguished from it, however, by the striagenses of the whole plant, by the leaves and flower of the petals, and by the spikes not being conjugate, the latter frequently two together. The calyxes are by no means imbricate, but larger and distinct, involving the seeds even when they are ripe. Native of Malabar.

7. Heliotropium supinum, trailing turnsole or heliotrope: leaves ovate, quite entire, tomentose, platied, spikes solitary. This is smaller than the common form, No. 5, with more slender branches, somewhat lanuginous, and prostrate; the root short and annual. Flowers white. Seeds usually one or two only, the rest being abortive; larger and more oblong than in the common form, brown, and covered with a bark. Native of the Cape of Good Hope; flowering in June and July.

8. Heliotropium fruticosum: leaves linear-lanceolate, hirsute; spikes solitary. This rises about seven or eight inches high, (Miller says one foot, and a half, and Browne that it seldom rises above five or six inches,) very much branched; branches stiff, scabrous, and ash-coloured. Native of the West Indies, near the sea-shore.

10. Heliotropium indicum, Indian turnsole or heliotrope: leaves cordate-ovate, item shrubby, spikes minute, aggregate-racemose, spikes conjugate; flowers very small, with the calyxes not being conjugate, the latter frequently two together. Corolla: monopetalous, salver-shaped; tube the length of the calyx; border flat, half-five-cleft, obtuse; clefts smaller, alternate, more acute, between the larger ones; throat naked. Stamens: filaments five, very short, in the throat; antherae small, covered. Filamentum: germs four, ovate, acuminate; fruits four, naked or corticate, not perforate, &c.—Essential Character. Corolla: filver-shaped, five-cleft, with teeth interposed; throat closed with arches.

Species. 11. Heliotropium catharticum, cathartic turnsole: leaves cordate-ovate, item shrubby, spikes minute, aggregate-racemose, spikes conjugate; flowers very small, with the calyxes not being conjugate, the latter frequently two together. Corolla: monopetalous, salver-shaped; tube the length of the calyx; border flat, half-five-cleft, obtuse; clefts smaller, alternate, more acute, between the larger ones; throat naked. Stamens: filaments five, very short, in the throat; antherae small, covered. Filamentum: germs four, ovate, acuminate; fruits four, naked or corticate, not perforate, &c.—Essential Character. Corolla: filver-shaped, five-cleft, with teeth interposed; throat closed with arches.

Species. 12. Heliotropium catharticum, cathartic turnsole: leaves cordate-ovate, item shrubby, spikes minute, aggregate-racemose, spikes conjugate; flowers very small, with the calyxes not being conjugate, the latter frequently two together. Corolla: monopetalous, salver-shaped; tube the length of the calyx; border flat, half-five-cleft, obtuse; clefts smaller, alternate, more acute, between the larger ones; throat naked. Stamens: filaments five, very short, in the throat; antherae small, covered. Filamentum: germs four, ovate, acuminate; fruits four, naked or corticate, not perforate, &c.—Essential Character. Corolla: filver-shaped, five-cleft, with teeth interposed; throat closed with arches.

Species. 13. Heliotropium Catharticum, cathartic turnsole: leaves cordate-ovate, item shrubby, spikes minute, aggregate-racemose, spikes conjugate; flowers very small, with the calyxes not being conjugate, the latter frequently two together. Corolla: monopetalous, salver-shaped; tube the length of the calyx; border flat, half-five-cleft, obtuse; clefts smaller, alternate, more acute, between the larger ones; throat naked. Stamens: filaments five, very short, in the throat; antherae small, covered. Filamentum: germs four, ovate, acuminate; fruits four, naked or corticate, not perforate, &c.—Essential Character. Corolla: filver-shaped, five-cleft, with teeth interposed; throat closed with arches.

Species. 14. Heliotropium Catharticum, cathartic turnsole: leaves cordate-ovate, item shrubby, spikes minute, aggregate-racemose, spikes conjugate; flowers very small, with the calyxes not being conjugate, the latter frequently two together. Corolla: monopetalous, salver-shaped; tube the length of the calyx; border flat, half-five-cleft, obtuse; clefts smaller, alternate, more acute, between the larger ones; throat naked. Stamens: filaments five, very short, in the throat; antherae small, covered. Filamentum: germs four, ovate, acuminate; fruits four, naked or corticate, not perforate, &c.—Essential Character. Corolla: filver-shaped, five-cleft, with teeth interposed; throat closed with arches.

Species. 15. Heliotropium Catharticum, cathartic turnsole: leaves cordate-ovate, item shrubby, spikes minute, aggregate-racemose, spikes conjugate; flowers very small, with the calyxes not being conjugate, the latter frequently two together. Corolla: monopetalous, salver-shaped; tube the length of the calyx; border flat, half-five-cleft, obtuse; clefts smaller, alternate, more acute, between the larger ones; throat naked. Stamens: filaments five, very short, in the throat; antherae small, covered. Filamentum: germs four, ovate, acuminate; fruits four, naked or corticate, not perforate, &c.—Essential Character. Corolla: filver-shaped, five-cleft, with teeth interposed; throat closed with arches.
Heliotrope leaves obovate, villose, entire; spikes simple and conjugate; seeds dotted. Both natives of the East Indies, sent by Koenig. This also is a native of Arabia; the Arabians derive it from the Indian, according to Vahl, only in having the twigs, leaves, and seeds, more closely villose and silky.

15. Heliotropium capitatum: leaves oblong-ovate, quite entire, smooth, hoary underneath; flowers in axillary heads; stem arborecent. This fort rises with a shrubby flalk six or seven feet high; the young branches are clothe with a white down, and the leaves on these are very hoary and entire, but those on the older branches are green, and some of them are notched on their edges; at each joint of the flalks come out two short branches opposite, with small hoary leaves placed opposite; these, when bruised, emit a strong odour, which to some persons is very disagreeable, but others are please with it. The flowers are produced from the side of the branches in many branches, with leaves upon long footed, which are clothed with light earth, plunged them into a hot-bed, and shade them till they have taken new root; then move them by degrees to the air, into which remove them in summer, placing them in a sheltered situation; in autumn house them in a good greenhouse, where they will flower great part of winter. If the cuttings be put into pots filled with light earth during any of the summer months, and plunged into a moderate hot-bed, they will take root freely, but these do not make good plants as those raised from seeds. A flower is most congenial to this plant in winter. A pure atmosphere is essential to its existence. In hot weather it must be well supplied with water, and in winter it must be carefully guarded against frost, so fatal to the natives of Peru. The fifth and sixth are annual sorts, which succeed better from seeds, which scarify the leaves upon long footed

16. Heliotropium Canariense: leaves ovate, crenate, opposite; flowers in dichotomous axillary heads; stem arborecent. Grows naturally in the Canary Islands, not far from a wood. Heliotropium three or four feet high, dividing into many branches, with leaves upon long footed; hairy, and of an ash-colour on their under side. The flowers are produced from the side of the branches on pretty long peduncles, each suffuring four short roundish spikes or heads, which divide by pairs, and spread from each other; the flowers are white, and appear in June or July, but are not succeeded by seeds in England. The leaves, when bruised, emit an agreeable odour, for which it is by some persons much esteemed; the gardeners have given it the title of Madame Maintenon. It is not for what reason we know not.

17. Heliotropium procumbens: stem procumbent; leaves ovate, crenate, quite entire; spikes solitary, terminating. This fort was sent from Carthage in Africa in January, 1780. It grows naturally on the sandy soils. It is a half-stem-clasping plant, with trailing stalks, growing six or seven inches long, with small leaves. The flowers are produced at the end of the branches, in single short spikes, which are reflexed; they are small and white, making little appearance.

18. Heliotropium Americanum: leaves oblong-ovate, coromons, conterminous, terminating, stem shrubby. Sent by the late Dr. Houltoun from La Vera Cruz, where he found it growing in plenty. It rises with a shrubby stalk three feet high, dividing into shorter branches, which are closely garnished with leaves, placed without order. The flowers are produced at the end of the branches in double spikes, which are slender, short, and straight, not recurved as the other sorts. The flowers are small and white; and the plant is perennial.

19. Heliotropium tetraandrum: leaves ovate-lanceolate, smooth, opposite; spikes heaped, terminating. Stem herbaceous, annual, one foot high, somewhat erect, diffused, white, obliquely four-cornered, with purple joints. Flowers red, in long close spikes; corolla somewhat bell-shaped. Found in the gardens of Cochinchina.

20. Heliotropium lineatum: leaves elliptic, petioled, rolled back at the edge, waved; spikes conjugate; corollas villose; stem procumbent. 21. Heliotropium lineatum: leaves oblong, villose, entire; spikes conjugate, terminating, stem shrubby. Perhaps only a variety of H. fruticosum, with broader leaves. Native of the West Indies.

22. Heliotropium pinatum: leaves pinnate. Stem erect, herbaceous, simple, only branching a little at the base, a foot high, the size of a goose-quill, villose. Found by Thouin at the frufts of Magellan.

23. Heliotropium amplexicaule: leaves lanceolate, obtuse, self-terminating; spikes branching; stem shrubby. This has the habit of H. Peruvianum; and was found in Brazil by Thouin.

Propagation and Culture. The first species may be propagated either by seeds or cuttings. The seeds may be sown upon a moderate hot-bed in the spring: when the plants are fit to remove, transplant them into small pots filled with light earth, plunge them into a hot-bed, and shade them till they have taken new root; then move them by degrees to the air, into which remove them in summer, placing them in a sheltered situation; in autumn house them in a good greenhouse, where they will flower great part of winter. If the cuttings be put into pots filled with light earth during any of the summer months, and plunged into a moderate hot-bed, they will take root freely, but these do not make good plants as those raised from seeds. A flower is most congenial to this plant in winter. A pure atmosphere is essential to its existence. In hot weather it must be well supplied with water, and in winter it must be carefully guarded against frost, so fatal to the natives of Peru. The fifth and sixth are annual sorts, which succeed better from seeds, which scarify the leaves upon long footed.

17. Thefe are propagated by seeds, but the difficulty of getting them fresh from America, and the uncertainty of their growing unless they are sown abroad, and brought over in earth, has rendered them rare in Europe. Being plants of little beauty, requiring a flower, with a peculiar soil and management, they have been cultivated merely for variety in botanic gardens. The eleventh fort is propagated by seeds, which may be procured from the places where it naturally grows, for it never produces any in Europe; these seeds should be sown in a tub of earth in the country, for when the dried seeds come over they seldom grow; and if they do, it is not before the second year: so that, if the seeds are sown as soon as they are ripe in a tub of earth, when they arrive in England, plunge them into a hot-bed of tanners' bark, which will bring up the plants; and when these are fit to remove, they should be each planted in a separate small pot filled with earth, composed of sand and light undug earth, with a little lime-rubifh well mixed together, then plunged into a hot-bed of tanners' bark, and shaded until they have taken new root; after which, they must be treated as other tender exotic plants, always keeping them in the tan-bed in the dove, giving them but little water, especially during the winter season. The fifteenth and sixteenth are too tender to live through the winter in the open air in this country, so must be kept in a greenhouse during that season; but only requiring to be freecened from frost, they may be placed with myrtles and other hardy plants; leave the leaves uncut, and when the weather have a large share of air in mild weather, and be treated in the same way; they are easily propagated by cuttings during any of the summer months, which, if planted in a shady border and duly supplied with water, will take root in five or six weeks; then they may be potted, and placed in a shady situation till they have taken new root, after which they may be treated as other plants. The other sorts have not yet been introduced into our gardens. See Lithospermum, Mentha, and Tournefortia.

Heliotropium Canariense, f. in botany. See Bystruppon.

Heliotropium Tricoccon. See Croton.
HELISPHERICAL, adj. [heli and sphere.] The helispheric line is the rhomb-line in navigation, and is so called because on the globe it winds round the pole spirally, and still comes nearer and nearer to it, but cannot terminate in it. *Harris.*

HELisson, in ancient geography, a town and river of Arcadia. *Pausanias.*

HELIUM, a name, anciently given to the mouth of the Mace in Germany.

HELius, the name of the Sun among the Greeks; but in Egypt it denoted the divinity Orus, or Osiris. When the Egyptians, says Porphyry, would describe Helius, they represent a man in a float, or ship, which is supported by a crocodile. Orus is often describ'd as standing upon a crocodile, and at the same time sur-rounded with other symbolical representations. For, as the Egyptians in their rites referred to a person preferred in the midst of waters; they accordingly, to describe that history, made use of types which had some analogy and resemblance to such preservation. Some of these could scarcely be called symbolical, the purport was so manifest. We are told by Jamblichus, that the figure of the crocodile was set up in the midst of the river, and was an emblem of Helius. This philosopher, as well as Plutarch, and Porphyry, falsely imagined, says Mr. Bryant, that these histories related to the real Helius, the Sun: and that the symbols of Selene had the like reference to the Moon. But Helius and Selene were names given to objects which were immediately connected with water; even the Moon's name, the Latin *adscamis*, is derived from the Greek *Hecate*; and Selene is a very obvious allusion to the Moon. But Helius and Selene were names given to objects which were immediately connected with water; even the Moon's name, the Latin *adscamis*, is derived from the Greek *Hecate*, and Selene is a very obvious allusion to the Moon. But Helius and Selene were names given to objects which were immediately connected with water; even the Moon's name, the Latin *adscamis*, is derived from the Greek *Hecate*, and Selene is a very obvious allusion to the Moon. But Helius and Selene were names given to objects which were immediately connected with water; even the Moon's name, the Latin *adscamis*, is derived from the Greek *Hecate*, and Selene is a very obvious allusion to the Moon.

HELIX, [heli, Gr.] Part of a spiral line; a circumvolution,—find the true inclination of the srew, together with the quantity of water which could make a difference between the helix and the spiral. A hair-case, according to Daviler, is in a helix, or is helical, when the hairs or steps wind round a cylindrical newel; whereas the spiral winds round a cone, and is continually approaching nearer and nearer its axis. Helix is also applied, in architecture, to the caulicules or little volutes under the base and flower, in the Corinthian capital; called also volute.—In anatomy, it denotes the whole circuit or extent of the auricle or border of the ear outward. In opposition to which, the inner protruberance surrounding therwith, and answering thereto, is called antihelix. See Anatomy, vol. I. p. 601.

HELIX, [Gr. from οὖς, to turn about.] In helminthology, a genus belonging to the order of teffacæ, the characters of which are:—Shell univalve, spiral, subdiaphanous, brittle; aperture contracted, semilunar, or roundish. The included animal is the *Snail*, which is a real Limas or slug; only that this genus has its tef tacous covering, whilst the other is wholly naked, with no other defence than a fleshly kind of shield. See the article Snail.

Though the snail is one of the moat humble of the tef tacous tribes, yet its family is very abundant; and the shells of some individuals are extremely curious and beautiful, and are prized by conchologists. See the article Conchology, vol. v. p. 56, where several of them are correctly figured. The snail appears to inhabit every part of the world, both on land and in the water. Some frequent gardens and woods, rocks and mountains, and beds of sand; whilft others prefer the depths of the ocean, fresh-water rivers, lakes, and ponds. The shells of the snails are united as follows:—

1. Whorls with a carinate acute margin. 1. Helix varicabes: shell ovate, both edges carinate; aperture toothed. Shell one inch and a half long, variegated white and brown; whorls contiguus, the first convex; aperture narrow, aprelied, a little flexuous; lip three-toothed. Shell each side, the outer lip acute and unequal. Inhabit mountains of Africa and the Friendly Islands, and was formerly supplied to have fallen in flowers from the clouds.

2. Helix fasciata: shell umbilicate, convex each side; aperture subelliptic, margined, ovate. Shell reddish-brown, with a ferruginous mark, brown variegated white, rarely hyaline; whorls five; navel and foot. Shell yellowish-brown, beneath more gibbous; aperture roundish, lunate. Shell grey or clear white, very finely striate transversely; whorls four or five. Inhabits the waterfalls of Lombardy: minute.

3. Helix umbilicata: shell subcarinate, umbilicate, convex; aperture margined. Shell whitish with a brown centre, glabrous; whorls a little depressed, yellow-brown; aperture white, beneath yellow; navel pellucid. Inhabits trees in Africa.

4. Helix frigida: shell subcarinate, umbilicate, convex, friate, beneath more gibbous; aperture roundish, lunate. Shell grey or clear white, very finely striate transversely; whorls four or five. Inhabits Europe, among rocks, in woods and hedges, and about the bodies of old trees; half an inch in diameter.

5. Helix pulchella: shell subcarinate, imperforate, convex; aperture oblong-ovat, with four, five, six, or eight, plaits or teeth; whorls six. Inhabit India: one inch and a half wide.

6. Helix pulchella: shell imperforate, subcarinate, reddish-brown with a white ridge; aperture transversely ovate, flat; shell one inch and a half long, flat each side, with five roundish whorls; lip reflected. Inhabit India; about nine lines in diameter.

7. Helix pulchella: shell imperforate, a little convex each side, with a transverse lip. The shell is sometimes chefnut with dark rays, sometimes beneath white, or yellow and red, or blackish with a red or deep chestnut throat and lip; subcarinate, and about the bodies of old trees: half an inch in diameter.

8. Helix pulchella: shell subcarinate, imperforate, convex; aperture with a wide margin. Shell glabrous, white covered with a brown skin; aperture fulcrous with a brown border; whorls obtuse. Inhabit America; a land species, and very large.

The remaining species in this division, 9-51, are named as follows: H. marginata, cicatricoza, argophthalmos, albella, maculata, albina, algina, leucus, lievipes, exils, vermiculata, candida, spadicea, incarna, fericea, argyros, planorbis, cornu, helix, dextral, nutirh, exils, alinum, cepa, bellis, pertenias, vortex, scabra, gothica, diomedusa, tricornis, helix, argyros, ficornis, commissum, allinum, marginella, fumosa, maculose, punctata, vitre,
vitrea, anulata, rhena, navius, corrugata, faba, cre-  

nata, and carinata.

11. Umbilicate: the whorls rounded. 52. Helix corn-  

nea: shell above umbilicate, flat, blackish, with four  

round whorls. From a line to an inch in diameter;  

shell chestnut, brown, rufous, whitish, yellowish, or blue-  

ish, polished, and very finely striate transversely; whorls  

four or five, rarely turned contrary. The inhabitant is  

black, with dirty-grey tentacles, and produces a searlet  

but not durable dye. Inhabits fresh waters of Europe  

and Coromandel.

53. Helix mitra: shell finely polished, yellowish, above  

convex, umbilicate, beneath flat, perforated. One to  

three lines in diameter. Shell diaphanous, highly pol-  

ished, sometimes brown; whorls three to five, the out-  

most much broader than the rest; aperture heart-shaped;  

inhabitant black, the tentacula t.tpt with white, when  

young entirely white. Inhabits ditches in Denmark,  

on aquatic plants.

54. Helix amphulacea: shell subumbilicate, tubular,  

glabrous, the whorls more venticose above; aperture  

very large, ovate-oblong; umbilicus or navel nearly  

covered. One to five inches wide. Shell polished, yel-  

lowish or brown, with generally a few bands; first whorl  

very large: this snail is eaten as a delicacy. Inhabits  

Asia and America.

55. Helix and

56. Helix conica: shell finely polished, yellowish, above  

convex, umbilicate, beneath flat, perforated. One to  

two lines in diameter. Shell diaphanous, highly pol-  

ished, sometimes brown; whorls three to five, the out-  

most much broader than the rest; aperture heart-shaped;  

inhabitant black, the tentacula tpt with white, when  

young entirely white. Inhabits ditches in Denmark,  

on aquatic plants.

57. Helix trisulca: shell subumbilicate, subglo-  

bular, glabrous, the whorls more venticose above; apertu-  

re very large, ovate-oblong; umbilicus or navel nearly  

covered. One to five inches wide. Shell polished, yel-  

lowish or brown, with generally a few bands; first whorl  

very large: this snail is eaten as a delicacy. Inhabits  

Asia and America.

58. Helix lucitana: shell umbilicate, perforate, con-  

vex, oblong, with five rounded yellowish-white whorls;  

umbilicus spreading. A land species; about the size  
of an egg. Inhabits Southern Europe.

59. Helix oblonga: shell perforate, ovate-oblong,  
friate, with roly lip and pillar. Above three inches long.  
Shell pale or yellowish-white, with five whorls, oval  
aperture, and whitish throat; inhabitant cinereous varied  
with lighter and darker shades and stripes, with a tinge  
of bluish and rose-colour on some parts; the eggs are  
covered with a hard calcareous shell, and exactly resem-  
bling those of a common sparrow. Inhabits South  
America and India.

60. Helix iavolulus: shell umbilicate, pointed, pale  
yellow or white, with spiral convex frigate; aperture cri- 
\[...\]
Pros 

animals on its body; and as in other animals we find 
these secondary ones either living on their surface, or 
in the interlines, as worms, so it is very remarkable that 
the snail is inhabited in both these ways. These final 
great destroyers of wall-fruit. Lime and ashes sprinkled 
on the ground where they most resort will drive them 
away, and destroy the young brood of them; it is a 
common practice to pull off the fruit they have bitten; 
but this should never be done, for they will touch no 
other fruit; they have wholly eaten up this if it be left for 
them; and their instinct is wonderful, that they know 
where to return to it. 

Among the many peculiarities of these animals, the 
mode by which they conduct their amours is the most 
curious and surprising; at this season they make their 
approach with waving fins, first one, and then the other, 
which are of a harp form and of a horny substance. 
These are contained within a cavity on the right 
side of the neck, and are launched at each other, with 
some degree of force, at about the distance of two 
inchs, till the quiver or reservoir is exhausted, and 
then a reconciliation takes place, and the animals unite. 

The eggs are perfectly round, and about the size of small 
peaef. The shell is eight lines wide, sometimes entirely 
whitish or various shades of yellow, but generally va-
riegated with dusky linear spots, or blackish spots and 
marks. 

Helix perversa: shell subumbilicate, ovate-oblong, 
contrary, sulphur. Eighteen to twenty-eight lines 
long. Shell sulphur-coloured with various marks, some-
times with a green spot and rufous band, sometimes with 
white brown oblique streak, or white with a red spot 
or numerous ones of a different colour, whorls fix to 
eight; lip thick. Inhabits India. 

Helix lanthana: shell nearly imperforate, round-
ish, obtuse, diaphanous, and very brittle; aperture di-
hibited behind, with an emarginate lip. Shell violet, with 
a subtriangular aperture; the naiil when alive shines by 
night, and stains the hand with a violet or purple dye. 
It inhabits the seas of Europe, especially the Medi-
terranean; those of Asia and Africa; and also the ocean. 
Dr. Hawkeworth, in his account of Cooke's voyage, 
mistakes this snail for that which yielded the 
purpura of the ancients. 

Helix vivipara: shell imperforate, ventricose, 
subovate, obtuse, brownish, with dusky bars; aperture 
neary orbicular. One inch and a half long. Shell thin. 
This prey is very acute. Snail small, white, with two 
short tentacles, and incumbent fqualid lip. Inhabits 
Ceylon. 

Helix haemalona: shell imperforate, roundish, 
brown, with a subcylindrical white band; aperture pur-
ppe. One inch and a half broad, and nearly as much 
high. Shell obtuse, within white, with five round whorls, 
the fist as large again as the rest, the last reddish. 
Inhabits Ceylon. 

Helix variagata: shell imperforate, subovate, 
covered with a brown cuticle, under which it is barred; 
aperture white within. Shell brown, radiant with white 
and marked with yellowish bands spotted with white, 
or reddish-white with four brown bands undulate with 
white, and two narrower ones spotted with white on the 
second whorl. Inhabits Italy. 

Helix drizaeta: shell liriate, with a suboval apers 
whorls reflected on the back. Shell pellicul, 
greenish. Found at Sandwich: very rare and minute. 

This division contains also the following species, 147— 

H. tecta, recta, inverta, interrupta, contraria, 
davy, arenaria, Jamaicaensis, Rhodota, labiosa, podica, 
giganusa, falcata, diamitis, membralis, lucorum, grui 
ناس, pulla, venusa, pulmona, aperita, verticalis, alfe, 
nucleus, cocinea, variagata, and fulgidia. 

IV. Taping. 181. Helix subcylindrica: shell im-
perforate, tapering, subcylindical, obtuse, with four 
whorls and ovate aperture. Shell size of a grain of rye, 
horny, pale, with a very obtuse tip; interior margin of 
the aperture reflected. Inhabits fresh water of Northern 
Europe. 

182. Helix fagorum: shell subperforate and a little 
tapering, with five whorls and ovate aperture. Shell 
horny, pale, ovate-oblong, rather acute, hardly as large 
as a barley-corn, with a very minute navel and mar-
gined aperture. Inhabits fresh waters. 

183. Helix ohtona: shell subperforate, tapering, 
with eight whorls and roundish aperture. Hardly four lines 
long. Shell glabrous, very brittle, horny, with some-
times fix whorls separated by a very thin line, the first 
twice as large as the second; umbilicus not visible. In-
habits ponds of Europe and America. 

184. Helix columnata: shell tapering, white, with a 
fusiliv tip and spotted contrary whorls; aperture ob-
long. Twenty-seven lines long. Shell allucid, of the 
 Splendour and colour of alum, appearing as if radiate 
with tulsoral spots; whorls seven or eight, gibbus 
each side, longitudinally and spirally; the fourth, 
fifth, and sixth, fubilves with white upper margin; 
aperture with pellicul spots, not margined, the interior 
marg vulnerability. 

185. Helix flcliculus: shell tapering, pellicul, gla-
brous, with a slightly-plaited pillar; lip thin. Shell 
size of an oat, uniformly white with five or six round 
whorls, and lunate, oblong, aperture. Two-thirds of an inch 
long. Inhabits Barbary. 

186. Helix lancharcivia: shell a little tapering, very 
glabrous, chefust-brown, with darker spots; throat 
whitish. Inhabitfs Coromandel, in fresh waters. 

The following species, 187—209, are also contained in 
this division: H. decollata, scalaris, circinata, tenera, 
pus, plicaria, undulata, fucata, piripus, feptra, 
fulgida, splendida, mitra, atra, cupidata, rechata, carinula, 
croce, obtusata, and purpurea. 

imperforate, ovate-oblong, coarfe, with fix whorls, 
and lunate, oblong, aperture. Two-thirds of an inch 
long. Inhabitfs Mauritania. 

211. Helix truncatula: shell ovate-oblong, the whoris 
truncate upwards. Aperture ovate. One line and a half 
to five lines long. Shell black, subpeclucul, with fix 
whorls, and incumbent equalid lip. Inhabits Greece. 

212. Helix glutinosia: shell ventricose, diaphanous, 
with six obtuse projections, and aperture wide. Two to four 
lines long. Shell very thin, fragile, yellow, with two 
or three whorls and repand rounded aperture; smail 
white, with cinereous dots, and furnished with a gelati-
nous membrane covering the whole shell. Inhabits Den-
mark; chiefly on the leaves of the Nymphaeus lutea. 

213. Helix minutula: shell subcylindrical, with an oval 
toothless aperture. Not a line long; and is very minute. 
Inhabitfs Greece. 

214. Helix auricularia: shell imperforate, ovate, gib-
brous, with a depression in the middle of the lip; spire 
acute and very short; aperture very much dilated. Two 
to fifteen lines long. Shell whith-yellow, cinereous, or 
brownish, rarely ribbed; whorls three to five; the fist 
very ventricose, the last small, and forming a minute 
aper; smail white, with cinereous dots and black eyes. 
Inhabits ponds of Europe. 

215. Helix perpulcia: shell imperforate, convex, ovate, 
without lip; aperture extending to the tip. Shell milk-
white, transparent, and very brittle. Inhabits the Me-
diterranean; between a Bulla and Helix. 

216. Helix haliotodes: shell imperforate, depressed, 
with waved fric; aperture oval, open all the way down. 
Shell flat, elliptic, thin, pellicul, white, or reddish 
with a white band, or orange with two paler bands, 
flitly conuate outwardly; whorls four lateral; lip 
acute. Smail, flat, and oval. Aperture. Inhabitfs the 
Mediterranean, Atlantic, Indian, and North, seas; and is nearly related to the genus 
Haliotus.
S30

inner lip is not reflected; with the umbilicus open in lar. Shell small, white, resembling a Nerita, but the ■

HELL, f., [a word purely Saxon. Etymologifls con-

ceve it may be derived from "Belan," which in the Saxon

language signifies "to conceal; hide; cover.""

In common acceptance, the word "Hell" is ufed to
denote that place, in which after death, and at the final
retribution, all who have wilfully and knowingly per¬
spired in doing Evil, with a consciousness that it was
Evil, and with a fixed intention of violating what they
believed to be Right and Good, will be punished for
such perverseness and malignity, such depraved corrup-
tion of heart and conduct.

Except it be in a condition absolutely favage, we find
in Man a natural appetite that condenm Punifhment will
follow intentional Guilt. His Conscience has fore¬
bodings of Reffonableness at fome or other period, and
feels confciences under those forebodings. Why should
our Creator have implanted in Man fuch a Conscience and fuch Apprehenfions, if there were no Reffonableness?
His Infinite Wisdom does nothing in vain. "If He hath
given us the Eye for sight, and the Ear for hearing, it
is implied in the

agreed. That Place, wherever or whatever it may be,
is implied in the

fhiroft tenfe of the word HELL.

The Greeks of highaff Antiquity called this Place
by a name expressive of its Inviolability or Ocfccurity; for
"Aδια or Αδιπ implies both; being derived from Greek
words which signify "not to fee."" Homer, who is equally valuable as a Mythologist and a Poet, founds the Eleventh Book of his Odyssey on the prevalent persuasion, that there existed an Inviolable region appropriated to the reftirence and punishment of the wicked. Hence he makes Ulysfees give this description of the sufferings there endured by Titus
and Tantalus:

There Tityus large and long, in fetters bound,

O'erflreads nine acres of infernal ground;

Two ravenous vultures, furious for their food,

Scream o'er the fiend, and riot in his blood,

Inceffant gore the liver in his breaft,

Th' immortal liver grows, and gives th' immortal fea.

From the fame poet we collect the opinion of his con¬
temporaries, that Wicked Men were tormented by Fu¬

ries after death, in fome place under the Earth: for

Agamemnon calls them to witnefs in thefe words—:

Who rule the dead, and horrid woes prepare

For perjur'd Kings, and all who falfely swear.

Ancient Mythology speaks of Rivers in "Hell," all
of which flow into an immense gulph called "Tartarus."
Into this gulph, according to the account given by Plato,
(see Phaedo in Forfter's Ed. p. 302.) "Thofe who appear
incurable through the magnitude of their offences,
having committed many heinous acts of sacrilege; many
pear incurable through the magnitude of their offences,
(see Phaedo in Forfter's Ed. p. 302.) "Thofe who appear
incurable through the magnitude of their offences,
having committed many heinous acts of sacrilege; many
unjust and unlawful murders; and other crimes of similar
enormity; are plunged without prospect of ever
emerging."

The Philofopher, in that passage, delivers only popu¬
lar opinion exaggerated by poetical fiction. In his Tenth
Book concerning "Laws," he writes in language more
lofty and more corresponding with his own feries ideas
about Divine Juflice. "Neither you, nor any other per¬
to whom he may have been fortunate, will boaft that
he has overcome this Juflice of the Gods. They, who
have ordained it, have ordained it in a manner more firm
than all their decrees; you ought therefore by all means
to beware. For, you will never be overlooked by it.
Nor not even though small, you should descend into
the depth of the earth: nor, though ascending on high,
should you fear to heaven. Whether you remain here,
or whether you go to Hell, you will suffer condign punishment appointed by them.'

The Roman poets, like the Grecian, describe Furies, as avengers of wickedness in Hell. They represent these Furies as unceasing, measure, male; they clothe their bodies with black garments; affix to their heads hair instead of hair; and arm their hands with scorpions, whips, torches. Megera, Telephone, and Alethe, are names given to the Furies.

The greater part of the Sixth Book of Virgil's Aeneid is occupied in relating the descent of Aeneas into Hell, and the objects he there saw. The Poet of course indulges his fiction: but through the veil of Fable and Mythology, it is easy to discern his own persuasion that iniquity and impiety shall not escape unpunished. Remarkable to this purpose are the following lines, in Pindar's Translation:

"They that on earth had base pursuits in view, THEIR brethren hated, or their parents flew, And, still more numerous, they who swelt'd their store, But ne'er reliev'd their kindred or the poor; Or in a cause unrighteous fought and bled; Or perih'd in the foul adulterous bed; Or broke the ties of faith with dark deceit; Imprison'd deep, their defined torments wait,"

Par. L. B. i. 59.

The Editor of Virgil, Dr. Jofeph Warton, remarks on this passage: "Let those who think reading the poets an useful and pleasing study, attentively consider the noble and just moral that is contained in this description of the criminals whom our poet hath here selected to be punished. Bishop Warburton observes, that "this passage relates to the infringers of the duties of imperfect obligation, which Civil Laws cannot reach: such as, want of natural affection to brothers, duty to parents, protection to clients, and charity to the poor."

He adds, "next to these are placed, those pefts of public peace, the traitor and the adulterer. It is observable, he does not say simply, adulteri, but o adulterium caec; as implying, that the greatest civil punishment makes no atonement for this crime at the bar of divine justice."

In giving descriptions of "Hell," Homer was followed by Virgil, and both have been imitated by subsequent Poets; Quevedo, for instance, and Dante. Our own poet Milton hath drawn a picture of it in terms perhaps more strong than either: At once, as far as Angels ken, he views The infaluation waife and wild; A dungeon horrible on all sides round As one great furnace flam'd, yet from those flames No light, but rather darkness visible Serv'd only to discover lights of woe, Regions of forrow, doleful shades, where peace And rest can never dwell, hope never comes That comes to all; but torture without end Still urges, and a fiery deluge fed With ever-burning sulphur unconsum'd."

Par. L. B. i. 846.

Before we leave the poetical accounts of "Hell," and particularly those which we find in Homer and Virgil, who were prior to the Christian Era, it is material to observe, those Writers did not precise, but followed popular opinion: they did not invent, but exaggerated the idea, that Punishment after death awaits the crimes of life. The idea had its foundation and was rooted in the human mind: before the conceptions of fancy could add to its enlargement. We cannot have a stronger proof, that the idea of future punishment is natural and familiar to Man, than by seeing Man, and hearing his opinions, before he was acquainted with the doctrines either of Jewish or Christian Religion. Let us turn then to the "Decades of Peter Martyr." In B. iii. Dec. p. 43. we find this passage:

"When the Admiral (Columbus) was hearing divine service on the shore, (of Cuba,) to his astonishment there came a Chief about eighty years old, and a multitude yet naked, and with him a large company of attendants. Struck with admiration, during the performance of the religious ceremonies, he stood silent, and with his eyes fixed: but when they were concluded, he preferred to the Admiral a basket filled with the fruits of his country, which he carried in his hand, and fitting down near him, by means of Didadus, an interpreter, who came from one of the colonies, and who, upon near approach, underfoot that dialect, he spake to this effect:

"We have been told, that with your powerful army you have made a rapid progress through all those lands, with which heretofore you were unacquainted; and that you have greatly terrified the people who inhabit them. Know then, by my exhortation and admonition, That for the Souls of Men departed from their Bodies, there are Two different ways of definition; the one dark and horrible, prepared for those who disturb and annoy Mankind; the other pleasant and delightful, appointed for those, who during life have loved the peace and tranquility of nations. If you will remember that you are Mortal, and that Future Retributions are reserved for every person, proportioned to his present actions, you will make no one unhappy.""
not, and the fire is not quenched."—See Bishop Lowth's Translation of Isaiah: Note on V. 24, Ch. lxvi.

Hell, by the Mahomedans, is supposed to be "divided into seven stories or apartments, one below another, designed for the reception of as many distinct classes of the damned. The first, which they call al-Haquir [hārīr], they say, will be the receptacle of the wicked Mahomedans; and, after having there been punished according to their deserts, will at length be replete. The second, named Lādāk, they assign to the Jews. The third, named al-Hotama, to the Christians. The fourth, named al-Sā'īr, to the Sabians. The fifth, named Sā'īr, to the Magians. The sixth, named al-Jābl, to the idolaters. And the seventh, which is the lowest and worst of all, and is called al-Hāwāyīt, to the hypocrites, or those who outwardly professed some religion, but in their hearts were of none."

The wicked will suffer both from intense heat and excessive cold. "The degrees of pain will vary in proportion to the crimes of the sufferer, and to the apartment to which he is condemned." "The misery will be greatly increased by despair of ever being delivered from the place (of torment), since, according to that frequent expression in the Koran, (unlesse they have been Mahomedans,) they must remain therein for ever."—See Preliminary to Sale's Koran, p. 121, 122.

Hell has been diversified in its locality, according to the different imaginations of Writers in different ages and countries. Some have placed it in the centre of the Earth; some in the Sun; some in Comets. Diffusions on this subject are all nugatory, because after all that can be said on the precise situation of "Hell," in its First Acceptation, we must conclude, as we began, with ambiguity. With Barrow therefore we adopt the words of Austin, Melius est dubitare de occultis, quam sitigere de incertis; "It is better to doubt of things hidden, than quarrel about things uncertain." We adopt also the declaration of Calvin, Statum et temporarium est de rebus incognitis aetatis inquirere, quam Deus nostri fore permetat; "It is foolish and rash to enquire concerning things unknown, much more deeply than God permits us to know."

But although we reject, as endlesles and therefore useless, all dispute about the exact situation of "Hell," yet reasoning as we do from the Attributes of God, and supported as we are by the warranty of Scripture, we cannot but conceive there will be some Region where conflagrunt punishment will hereafter await the impenitently wicked.

God is the Moral Governor of the Universo. As such, it were irreverent to suppose, that He will suffer the Eternal Laws of Right and Wrong to be violated with impunity. In the present state of things, Evil, on innumerable occasions, goes unpunished by human or divine justice. Arguing therefore from the Rightcounsels of God, we cannot but conclude, that the Evil, not punished here, will be punished hereafter. This is an inference even of Natural Religion, and the uniform language of Scripture most completely and directly establishes its consistency with truth.

It is well laid down by Wollaston, as an incontrovertible Proposition, that as God has appointed all things with infinite Wisdom, and has ordained a Future State as a receptacle from this State of Probation, "the Mansions and Conditions of the Virtuous Part of Mankind must be proportionably better than those of the Vicious."

In that most sublime and noble song of triumph, which Isaiah conceived would be applicable on the future overthrow of the oppressive and haughty tyrant of Babylon, the Prophet introduces "Hell" as moved to meet him: "It stirreth up the dead for thee; even all the chief ones of the earth; it hath raised up from their thrones all the kings of the nations."—Isa. xiv. 9. Thus paraphrased by Lowth:

"Te propter, imis concita sedibus
Nigrantis Orci magna fremit domus:
En iussa defuntos Tyrannos,
Seepri tagras folis aulavillia sententias.
Exspectant Usbras, hospitios in novi
Occursum cunea."

De Sacra Poeh Hebræorum, Prol. 28.

Whom
Whom Mafon has followed with equal spirit;  
Hell, from her gulp profound,  
Routes at thine approach; and all around  
Her dreadful notes of preparation sound:  
Seated at her awful hold,  
Her shadowy Heroes all,  
E'en mighty Kings, the heirs of empire wide,  
Rising, with solemn state, and flew,  
From their sable thrones below,  
Meet, and inflant thy pride.  
Mafon. Ode vi. St. 3.

Our Poets make compound words, by adjoining some term to "Hell:"  
Retire, or take thy folly, and learn by proof,  
Hell-born, not to contend with Spirits of Heaven.  

And reckonest thou thyself with Spirits of Heaven,  
"Hell-doomed," and breath'st defiance here and anon,  
Where I reign king?  
Milton.

Hell-Governed, adj. Governed by hell:  
Earth, gape open wide and eat him quick,  
As thou dost swallow up this good king's blood,  
Which his hell-govern'd arm hath butchered. Shakespeare.

Hell-Hated, adj. Abhorred like hell:  
Back do I toss these treasons to thy head;  
With the hell-hated lie o'erwhelm thy heart. Shakespeare.

Hell-Haunted, adj. Haunted by the devil:  
Fierce Omond clos'd me in the bleeding bark,  
And bid me stand oppos'd to the bleak winds,  
Bound to the fate of this hell-haunted grove. Dryden.

Hell-Hound, f. [hell hound, Sax.] Dog of hell:  
Now the hell-hounds with superior speed  
Had reach'd the dame, and, fastening on her side,  
The ground with lilling streams of purple dy'd. Dryden.

Agent of hell:  
I call'd  
My hell-hounds to lick up the dross, and filth,  
Which man's polluting sin with taint had feed. Milton.

Hell-Kettles, three singularly curious fashion-  
man pools, upwards of ninety feet deep, situated near  
Darlington, in the county of Durham; for particulars of which see the article DARLINGTON, vol. v. p. 603.

Hell-Kite, f. Kite of infernal breed. The term  
hell prefixed to any word denotes defolation:  
Did you say all? What all? Oh, hell-kite! all?  
What, all my pretty chickens, and their dam,  
At one hell swoop? Shakespeare.

HELE, a town of Asiatic Turkey, in the Arabian  
trac, on the Ephrathes; fifty miles south of Bagdad.

HELLADIAN, adj. [from Ellas; Gr.] Belonging to  
Greece, or to the Greeks.

HELLADIAN, f. A Greek.

HELLANICUS; a celebrated Greek historian, born  
at Mytilene. He wrote a history of the ancient kings of  
the earth, with an account of the founders of the most  
ill-famed towns in every kingdom, and died the year  
before Christ 411, and in the eighty-fifth of his age.

HELLE, in mythology, a daughter of Athamas and  
Nephele, fitter to Phryxus. She fled from her father's  
house with her brother, to avoid the cruel oppression of  
hers mother-in-law, Ino. According to some accounts  
he was carried through the air on a golden ram which  
his mother had received from Neptune, and in her paffage  
the became giddy, and fell from her seat into that  
part of the sea which from her received the name of  
Hellespont. Others say that she was carried on a cloud,  
or rather upon a ship, from which she fell into the  
sea and was drowned. Phryxus, after he had given his siter  
a burial on the neighbouring coasts, pursued his journey,  
and arrived safe in Colchis. Ovid.
HELLEBERG, a town of Sweden, in the province of Smalholm: twenty-three miles north-west of Calmar.

HELLEBORASTER, HELLEBORAS'TRUM, and HELLEBORE. See HELLEBORUS.

HELLEBORE (White). See VERATRUM.

HELLEBORE (Green). See Helleborus, Cypripedium, Limodorum, Satyrium, and Serapion.

HELLEBORESS. [Helleborus; Dioscorides: ἡλέβορος] οὖν το ἡλέβορον, because it destroys those who eat it. Ray. From ἑλέβορον to bind, and ἡδύ, food; a contriving, ful-focating, or poisonous, food. Morison and Linnæus. From the river Elleborus. Bergmann. HELLEBORE. In botany, a genus of the class Polyandria, order Polygynia, natural family Ranales, subfamily Ranunculaceae. [Ranunculus]. The generic characters are—Calyx: none, unless the corolla, which in some species is permanent, be considered as such. Corolla: petals five, roundish, blunt, large; nectaries several, very short, placed in a ring, one-leaved, tubular, narrower at bottom, mouth two-lipped, upright, emarginate, the inner lip short. Stamens filaments numerous, fimbulate; anthers compressed, narrower at bottom, upright. Pistillate: genus about six, compressed, filiform to linear; stigmas united, or sessile, linear. Pericarpium: capsule constricted, five-leaved, or more; calyx none, or connate, close, orifice superior, opening irregularly. Seeds: fleshy, the upper part long and rounded; the common, smooth, fleshy, the upper half fessil. Native of Italy, Germany, Austria, Slovenia, in mountainous situations; flowering from December to March. It has the name of black hellebore from the colour of the root; and of Clifortias rive from the time of flowering and the colour of the corolla. This is supposed to have been the plant so celebrated amongst the ancients in the cure of madness: the taste of the root, when fresh, is bitterness, and according to Dr. Grew, "being chewed, and for some time retained upon the tongue, after a few minutes it feemeth to be benumbed, and affected with a kind of pain, even in the mouth; yet it is burned with eating or fipping any thing too hot." It is a nauseous acid fluid; but, being long kept, both its sensible qualities and medicinal activity fuller very confiderable diminution. Bergius has very properly attended to this circumstance, for in defining its virtues he considers it under three different degrees of dryness: "Virtus recentis venenata, rubefcens, nigra; recente fucata necetica, purgans; emmenagoga, antiphthirica, tertamina; dia confervea vi purgans, alterans, diuretica." Although many writers consider this root as a perfectly innocent and safe medicine, yet we find several examples of its poisonous effects; it should therefore be used with caution. It seems to have been principally from its purgative quality that the ancients esteemed this root as a powerful remedy in maniacal disorders, with a view to evacuate the utrae bibl, from which these mental diseases were supposed to proceed; but, though evacuations be often found necessary in various cases of alienation of mind, yet, as they can be produced with more certainty and safety by other medicines, this cathartic of antiquity seems now almost entirely abandoned; it is however still used in small doses for attenuating viscid humours, promoting the urinary and uterine discharges, and opening inverte obstructuons of the remotest glands; it often proves a powerful emmenagogue in plethoric women, where it is not a little decisive, both in the prevention and cure, and particularly in cases of uterine discharges. It is also used in dropsies; and in some cutaneous diseases.

4. Helleborus viridis, or green hellebore: ftem bifid; branches leafy, two-flowered; leaves digitate. Stem round, a little branched at top, but not near so much as in the next sort; leafy, reddish at the base, upright, smooth, a foot or eighteen inches in height. Leaves not of a stiff leathery consistence, as in the next species, but soft, and of a lighter green. Native of France, Italy, Austria, Carniola, Slovenia, Switzerland, and Great Britain; as in several places near Cambridge; Yorkshire, near Leeds; in Surrey, near Arundel-castle; Kent; Oxfordshire; Northamptonshire; Worcestershire; Hampshire. Parkin mentions his having seen it in the Northamptonshire woods. Ray, in his History, gives no hint of this or the next species being natives of England; and, in his Synopsis, to think that they are not aboriginals here. Baburt speaks of this as growing wild abundantly in Stokenchurch woods, and many other rough and hilly situations. It flowers in March and April.

5. Helleborus fitidus, flinking hellebore, or bear's foot: stem many-flowered, leafy; leaves pedate. Root small, but bent with a prodigious number of slender dark.
Jitter-wort, fetter-grafs, oxheele. Green. Native of Italy, Germany, Switzerland, France, and England; as between Northfleet and Gravesend in Kent; near Cambridge; near Bungay and Brundish in Suffolk; Combury stone-quarry in Oxfordshire; abundantly in Suffex; in Hampshire, and Somersetshire. Gerarde says, that it was wild in his time in many woods and shady places in England. He calls it bear-foot.

They are of a very deep green; but the brandies, in any branches, producing great abundance of flowers. It flowers from November and January.

The term Hellen was originally a sacred title; and seems to have been confined to those priests who first came from Egypt, and introduced the rites of the Ark and Dove at Dodona. They were called also Elii and Soli. This country was therefore the first Hellenes; and here were the original Hellenes; and from them the title was derived to all of the Grecian name.

From Babylonia the Hellenes came into Egypt; they were the same as the Aurite, or Cuthite Shepherds; they introduced into that country their arts and learning, by which it was greatly benefited. Hence the learning of Egypt was styled Hellenics, from the Hellenic Shepherds; and the ancient theology of the country was said to have been described in the Hellenic character and language. This had no relation to the Hellenes of Greece; being far prior to that nation. The Greeks, it is true, were both Ionim and Hellenes, but by a long deftinction, being the peculiar of the people one has spoken of. This theology was said to be derived from Agathodemon, (the name as Cnephe,) that benign deity, the benefactor of all mankind. He was supposed to have had a renewal of life; and on that account was represented under the figure of a serpent crowned with the lotus and name Noe Agathodemon; (the Greeks transposed, and expressed it no agathodaimon.) The Greeks supposed, that by the Hellenic tongue was meant the language of Greece; and that the Hellenic characters were the letters of their own country. But these writings were in reality sculptures of great antiquity: and the primitive language of Egypt was styled by Manonellon the sacred language of Egypt.

HELLENA, f. in botany, a genus of the class nap- mandris, order monogynia. Essential generic characters—Corolla with a double border, the exterior mostly threecleft; nectary two-leaved, or bifid; capsule three-celled, corinconeus, inflated, subglobular; calyx spicate, campanulate, bifid.

Species.

1. Hellenia allalunga: nectaries two-leaved; capsules somewhat spongo; leaves very entire, oblong, acute, glabrous each side, with a very entire whitish margin; flowers red. Inhabitats Ceylon.

2. Hellenia alba: nectaries two-leaved, or bifid; capsule three-celled, corinconeus, inflated, subglobular; calyx spicate, campanulate, bifid.

3. Hellenia chinensis: nectaries two-leaved; leaves ciliate, oblong, acute, glabrous each side, recurved at the tip, with a whitish subulate margin very finely dentate towards the tip; flowers yellowish. Inhabitats China.

4. Hellenia aquatica: nectaries one-leaved, bifid; leaves dentate at the margin, oblong, acute, glabrous each side, with a villous denticulated margin; flowers reddish. Inhabitats India.

HELLENISM, f. [ἐληληνισμός, Gr.] A Greek idolism.

HELLENISMS, f. [Εληληνισμοί, Gr.] A name or term given to the first innovation in religion. It had no relation whatever to Greece, being far prior to Hellas, and to the people denominated from it. Though, says Mr. Bryant, it be among the Cuthites, in Chaldea; yet it is thought to have arisen from one of the family of Shem, who reigned among that people. Epiphanies accordingly tells us, that Ragem, or Ragan, had for his son Seruch, when idolatry and Hellenism first began among men. But Ezechiel and other writers mention, that he was the author of this apostacy: "Seruch was the first who introduced the false worship called Hellenismus." Some attribute also to him the introduction of images; but most give this innovation to his grandson Terah...

The people of Midian lived upon the upper and eastern recesses of the Red Sea; where was a city called Eliacea Elene of Ptolemy, and Allene of Josephus. It happens, that there are in the opposite recesses of the Red Sea and of Mofes, which ran into it: but the bay on the other side was denominated from the people, who there settled. They were Cuthites, of the same race as the Ionim and Hellenes of Babylonia, from which country they came. They built the city Elana, and were called Hellenes (the people still retain their primitive name Elanae: Dr. Po- cock calls them Allani,) from the great luminaries, which they worshipped; and to which their city was sacred. In the days of Mofes the whole world seems to have been infected with the rites of the Jabimans: and Jethro the Cuthite was probably high-priest of this order, whose daughter Mofes married. They very frequently conflituted in worshipping the luminaries El-Ain; which wor¬

Hellenistic Dialect, that used by the Grecian Jews who lived in Egypt and other parts where the Greek tongue prevailed. In this dialect it is said that the Septuagint was written, and also the books of the New Testament; and that it was thus denominated to show that it was Greek filled with Hebraisms and Syriacisms.

HELLENISTS, f. [Hellenize, Lat.] A term occurring in the Greek text of the New Testament, and which in the English version is rendered Grecians. The critics are divided as to the signification of the word. Exceimenius, in his Schola on Acts vi. 1. observes, that it is not to be understood as signifying those of the religion of the Greeks, but those who spoke Greek. The Grecians, he says, were Cuthites, of the same race as the Ionim and Hellenes; and the ancient theology of the country was derived from the Hellenic characters. But such a change would not satisfy them: and they made some farther alteration; and rendered it Ionic 'ἐξωτερικός with an aspirate; and made it by these means relate to their own country.

HELLENISTIC DIALECT, that used by the Gre¬

The people of Midian lived upon the upper and eastern recesses of the Red Sea; where was a city called Eliacea Elene of Ptolemy, and Allene of Josephus. It happens, that there are in the opposite recesses of the Red Sea and of Mofes, which ran into it: but the bay on the other side was denominated from the people, who there settled. They were Cuthites, of the same race as the Ionim and Hellenes of Babylonia, from which country they came. They built the city Elana, and were called Hellenes (the people still retain their primitive name Elanae: Dr. Po- cock calls them Allani,) from the great luminaries, which they worshipped; and to which their city was sacred. In the days of Mofes the whole world seems to have been infected with the rites of the Jabimans: and Jethro the Cuthite was probably high-priest of this order, whose daughter Mofes married. They very frequently conflituted in worshipping the luminaries El-Ain; which wor¬
and to three, and at length to nine. They assembled in a
place called Epeikos, in the Ionian forum, where they
were obliged to reside ten months before the celebration
of the games, to take care that such as offered them-
place called EA'EION, in the Marian forum, where they
pality of Janer, which runs into the Hatzbach nearRo-
cifes, and to be instructed in all the laws of games by
or did approve of any of the contenders. At the fo-
lemnity they sat naked, having before them the victo-
crown, till the exercises were finished, and then it
was pretended to whomsoever they adjudged it. Never-
theless, there lay an appeal from the hellenodice of the
Olympian senate.
HELBACH, a river of Silesia, in the prin-
cipality of Janer, which runs into the Hartbach near Ro-
verdorfb.
HELES-KERRIES, a shelter of small islands
Scotland, near the western coast, ten miles west of Rum
Island, Lat. 57° N. lon. 3°42'. W. Edinburgh.
HELES-PON'T, a narrow strait between Asia and
Europe, ten miles long, and three fathoms deep, called
Helle, who was drowned there in her voyage to Col-
chis. It is celebrated for the love and death of Leon-
der, and for the bridge of boats which Xerxes built
over it when he invaded Greece. It is now called the
DARDANELLES, which feem.
HELES-PONTcur, a wind blowing from the
north-east.
HELLGATE, a celebrated strait belonging to
the American States, near the west end of Long Island
Sound, opposite to Harlem in York Island, and about
eight miles north-east of New York city; remarkable
for its whirlpools which make a tremendous roaring at
certain times of the tide. These whirlpools are occasion-
ed by the narrowness of the channel, and a bed of rocks
which extends quite across it; and not by the meeting of the tides from east to west, as
has been conjectured, because they meet at Frog's Point,
several miles above. A skilful pilot may conduct a ship of
any burden, with safety, through this strait, at high
water with the tide, or at low water with a fair wind.
There is a tradition among the Indians, that in very re-
more times their ancestors could step from rock to rock,
and cross this arm of the sea at Hellgate.
HELLMERE, a town of France, in the depart-
munity of the Mofelle, and chief place of a canton, in the
district of Sarguemine; two leagues and three quarters
north-east of New York city; remarkable
or disapproved of any of the contenders. At the fo-
lemnity they sat naked, having before them the victo-
crown, till the exercises were finished, and then it
was pretended to whomsoever they adjudged it. Never-
theless, there lay an appeal from the hellenodice of the
Olympian senate.

There is a tradition among the Indians, that in very re-
more times their ancestors could step from rock to rock,
and cross this arm of the sea at Hellgate.
The helms o' th' Hate, who care for you like fathers,
When you curse them as enemies.
To helm a-loo, is to put the helm to the lee-side of the ship; a sea phrase.
To bear up the helm, is to let the ship go more large before the wind.
To point the helm, to put the helm over the left side of the ship.

The helme, adj. Furnished with a head-piece:
The helmed cherubim
Are seen in glittering ranks with wings display'd. Milton.

Helmershausen, a town of Germany, in the archduchy of Austria; eight miles south-west of Freyland.

Helmebrecht, a town of Germany, in Franconia, and principality of Coburg: sixteen miles north-east of Coburg.

Helmet, adj. [Probably a diminutive of helm.] A helm; a headpiece; armour for the head. See the article Armour, vol. ii. p. 200, and the correspondent Engraving. See also the article Heraldry, in this volume.

Sev'n darts are thrown at once, and some rebound
From his bright shield, some on his helmet found. Denham.

Helmet-flower. See Aconitum.

Helmet-haguges, f. [from ἐχὺς, Gr. a worm, and κώμα, to drive.] Expelling worms. Scott.

Helmet-hagogues, f. [from ἐχὺς, Gr. from ἐχεῖ, to roll about.] Worms; so called from their continual twisting and coiling.

Helmet-thic, adj. [from ἐχύς, Gr. Related to worms.

Helmet-thics, f. [helmitheca, Lat.] Medicines which expel and destroy worms.

Helmintholium, f. A genus of foils or petrifactions; for which see the article Mineralogy.

Helminthotheca, and Helminthia, f. in botany. See Peciris.

Helminthology f. [from ἐχύς, the genitive of ἐχυς; which in its first sense signifies 'an Earthworm;' then, 'A Worm of the Intestines;' and κώμα, a creature or devourer.] That department of natural history which investigates the orders and genera of worms; or that class of organized beings which the ancients distinguished by the name of imperfect animals. This designation was by no means applied uniformly, since by far the greater number of these creatures are destitute of ears, nose, eyes, and legs. They are all of them more or less blind, and their senses are so placed that their heads are the only things which they are attached. In substance they are mostly soft and gelatinous, and extremely tenacious of life; insomuch that, instead of being killed or destroyed by having their parts cut or broken off, they possess the singular power of reproducing them; in which faculty the polypi, of all their congeneres, seem wonderfully to excel. The parts of generation in most of them have as yet escaped detection by the microscope; but it is certain that they are chiefly hermaphrodites, and pollute the gift of fecundity in a very eminent degree. The head or anterior part is generally distinguished by tentacula, or feelers, which are retractable, and of the nature of the horns of snails. With these they feel and entangle their prey; and with them they convey to their mouth or orifice, whence they are also called arms. In all their characters they are totally different from insects, though they are often so designated by authors; but with manifest impropriety and error. Their organization is less perfect than that of the insect tribes; their members are very differently constructed; nor are they, like them, defined to undergo the different stages of metamorphosis. But, though lews known, they equal the insects in number, if they do not even surpass them; for there are few substances, either living or dead, in which vermes are not found to be inhabitants, and are obdurate and nourished within them. They perforate the clay, give a pittance to springs and water; they penetrate the earth, to fertilize the soil by the admixture of air and moisture; they bore through wood, and excavate rock and stone, to promote the wise purposes of an immaterial Providence; they are affixed a place even in the dark abyss of the ocean, to illuminate the waters by their phosphoric light; and as the stars of heaven do the surrounding atmosphere.

This class of animals has been divided by the French naturalists into four sections: the first containing the naked or bare worms, which in their characters approach the nearest to the caterpillars and larvae of insects; but without having the smallest relation to them. The second comprehends all those species which have either a seceous covering or shell; the organs of which were little known, till the valuable researches of Mr. Adanson proved that their structure closely resembled that of the naked worms. The third section comprehends the numerous class of worms with a crustaceous covering, the structure of which resembles flowers and plants, hence called animal flowers; but their organization is very different from that of the two preceding classes. The fourth section contains all those zoophytes whose conformation appears nearly to resemble them; for in resemblance chiefly is this classification founded. Its insufficiency, however, induced other naturalists, such as Kleine, Liffer, d'Argenville, &c., to found other systems of their own. Among the latter, till Sir Charles Linnaeus, with endows of mind form for such a task, favoured the world with the following classification of these humblest of all creatures in the scale of being; which in one chain carries the link of life by an almost imperceptible gradation to the efflorescence of a vegetable; whilst the other extends it as it were to a minute particle of sand; or rather to an invisible point, yet full of animation.

ORDERS, AND GENERA.

1. Intestina. Simple naked animals without limbs or eyes.

1. Found within other animals; characters as follow:

Acaris. - Body round, tapering each way; head with three velricle.—Common in children, and some adult persons; and found also in many animals.

Trichocephalus, Body round, tapering towards the tail; head furnished with a proboscis.—In man, the horse, &c.

Uncinaria, - Body filiform, elastic; head with membraneaceous angular lips; tail of the male aciform or needle-shaped, of the male
male armed with two hooks inclosed in a pellicul vessel.—In the badger and fox.

Filaria. - Body entirely filiform.—The dracunculus, or Guinea worm.

Scolex. - Body minute, gelatinous, opaque; head exsertile and retractile, with four pellicul auricles.—In the lophins.

Ligula. - Body linear, equal, and long.—Common in fish.

Linguatula. - Body depressed, oblong; mouth placed on the fore-part, and surrounded with four papilages.—In the hare.

Strongylus. - Body round, long; the fore-part globular and truncate, with a circular apertur fringed at the margin; hind-part of the female pointed, of the male hooded.—In horses and sheep.

Echinorhynchus. Body round, and ciliate on each side, with curved peduncles or feet; feelers two.—On the Echinus.

Clava. - Body fixed, with a rigid peduncle.—Found on the Echinus.

Lumbricus. - Body round, annulate, furnished with feelers on the fore-part. —In carp and tench.

Hirudo. - Body truncate at each extremity; head with limbs.

Planaria. - Body deprefled, with a ventral pore.—In man, horses, fowls, birds, and reptiles.

Furia. - Body linear and ciliate on each side, with reflected prickles.—In mice.

Cucullinus. Body pointed behind; the fore-part oblique and truncate, with a circular aperture fringed at the margin; hind-part of the female pointed, of the male hooded.—In horses and sheep.

Caryophylleus. Body round, smooth, with a large dilated mouth.—In carp and tench.

Fasciola. - Body depressed, ovate, with a terminal and lateral pore.—The gourd-worm or fluke, which produces the rot in sheep.

Tenia. - Body flat, jointed; head with four orifices for function.—The tape-worm, and hydatids, so common in the human subject.

Furca. - Body linear and ciliate on each side, with reflected prickles.—Burrows under the skin.

2. Not inhabiting the bodies of other animals; and without the lateral pore.

Gordius. - Body equal, filiform, round, and smooth.—The hair-worm, found in stagnant waters, old wooden pipes, &c.

Hirudo. - Body truncate at each extremity; head and tail dilated when in motion.—The leech.

3. Perforated, with a lateral pore.

Lumbricus. - Body round, annulate, furnished with minute concealed prickles.—The common earth-worm.

Sipunculus. Body round; mouth cylindrical and narrower than the head.—The tube-worm.

Planaria. - Body depressed, with a ventral pore.—Found in waters, wet meadows, &c.

II. MOLLUSCA. Simple naked animals, furnished with limbs.

1. Mouth placed above.

Aftinia. - Body fixed, with a single terminal dilatable aperture, surrounded by tentacula or cirri.—The sea-marygold, anemone, &c.

Clava. - Body fixed, with a single dilatable vertical aperture, surrounded by clavate tentacula.—On plats, and shells.

Pedicellaria. Body fixed, and furnished with a rigid peduncle.—Found on the Echinus.

Mammaria. - Body loose, smooth, with a single aperture without cirri.—Found in the ocean.

Ascidia. - Body fixed, with two apertures, one of which is terminal, the other placed a little beneath.—The sea-folk.

Salpa. - Body loose, with two apertures, one at each end.—Found in the Archipelago, Mediterranean, &c.

Dagysa. - Body loose, angular, open at each end.—Found in the Spanish seas.

4. Mouth before; body furnished with arms.

Pterotrachea. Body pervious, gelatinous, with a moveable fin at the head or tail.—Found in the Mediterranean.

Doris. - Body round, tapering, articulate; feelers two.—On the coast of Pembroke-shire.

5. Mouth before; body furnished with arms.

Limax. - Feelers four; vent common with the lateral pore.—The flug.

Lapylys. - Feelers four; vent placed above the lower extremity.—The sea-hare.

Tethys. - Body with two small pores on the left side.—In the Adriatic Sea.

6. Mouth before; body furnished with peduncles or feet.

Triton. - Arms twelve, divided; some of them cheliferous.—On the Italian shores.

Holothuria. Feelers or tentacula fleshly.—A beautiful species; inhabiting all seas.

Terebella. - Feelers or tentacula capillary.—The slip-borer.

7. Mouth placed beneath, and generally central.

Physothora. Body gelatinous, hanging by an air-bubble.—In the Mediterranean.

Medusa. - Body gelatinous, smooth.—Called the sea-nettle; and found in every part of the Ocean.

Lucernaria. - Body gelatinous, wrinkled, and furnished with arms.—In the Greenland seas.

Afetra. - Body coriaceous, flat, generally radiate, and muriicata with papille.—The sea-fla.

Echinus. - Body crustaceous, and covered with moveable spines.—The sea-urchin.

III. TESTACEA.
### III. Testacea. Mollusca covered with a shell.

1. *Multivalves; shells with many valves.*

- **Chiton.** - Valves placed in transverse plates down the back. - The ocrabion.
- **Lepas.** - Valves unequal; body sessile. - The acorn-shell.
- **Phlosa.** - Shell bivalve; with accessory valves at the hinge. - Inhabits the shores of most seas, and thorns by night.

2. *Bivalves; shell with two valves.* Conchs.

- **Mya.** - Hinge with generally a broad thick tooth, not let into the opposite valve. - The pearl-oyster. - Inhabits chiefly the bottom of the sea.
- **Solen.** - Shell open at each end; hinge with a single or double subulate reflected tooth, not let into the opposite valve. - The razor-shell, or knife-handle.
- **Tellina.** - Hinge with the lateral teeth of one valve not let into the other. - Inhabits all seas.
- **Cardium.** - Hinge with remote penetrating lateral teeth. - The cockle.
- **Mactra.** - Hinge with a complicated triangular middle tooth, and an adjoining hollow. - Found in all seas.
- **Donax.** - Hinge with a generally-remote lateral tooth, not let into the opposite valve. - In all seas.
- **Venus.** - Hinge with generally three approximate divericate teeth. - In all seas.
- **Spondylus.** - Hinge with two teeth separated by a small hollow. - The horse oyster.
- **Chama.** - Hinge in one shell, with two oblique obtuse teeth. - The gaper, or bayon-shell.
- **Area.** - Hinge with numerous penetrating teeth. - The limpet.
- **Offrea.** - Hinge without teeth, but an ovate hollow. - The common oyster.
- **Anomia.** - Hinge without teeth, but generally a linear depression on the rim, the back of one valve curved over the hinge. - The fringed oyster.
- **Mytilus.** - Hinge without teeth, with a subulate depression, and generally fixed by a silky beard. - The mussel.
- **Pinna.** - Hinge without teeth; valves united at one end and open at the other. - The nacre.

3. *Univalves, with a regular spire.*

- **Argonauta.** - Shell with one cell, spiral involute. - The argonaut.
- **Nautilus.** - Shell with many cells, with a hole of communication. - The nautilus.
- **Conus.** - Aperture euflue, longitudinal, without teeth. - The cone.
- **Cypræa.** - Aperture euflue, linear, longitudinal, toothed each side. - The cowry.
- **Bulla.** - Aperture a little contracted, and placed obliquely. - The dipter, or pewit's egg.
- **Voluta.** - Aperture euflue; the pillar plaited. - The mitre, or volute.
- **Buccinum.** - Aperture with a small canal leaning to the right. - The wink.
- **Strombus.** - Aperture with a small canal leaning to the left. - Spiral shells.
- **Murex.** - Aperture with a small, straight canal. - Muriated or rocky shells.
- **Trotus.** - Aperture contracted and somewhat square. - Sea-tops.
- **Turbo.** - Aperture contracted and orbicular. - Turbinated or wreathed shells.

### Helminthology.

- **Helix.** - Aperture contracted, lunate on the inner side. - The snail.
- **Nerita.** - Aperture contracted and semi-lobular.
- **Halictis.** - Shell with a row of orifices along the surface. - The sea-ear.

4. *Univalves, without a regular spire.*

- **Patella.** - Shell conic, the aperture widened like a basin. - The limpet.
- **Dentalium.** - Shell slender, subulate, open at both ends. - The dental, or sea-tooth.
- **Serpula.** - Shell tubular, mostly serpentine, adhering to other bodies.
- **Teredo.** - Shell thin, pierced to wood. - The ship-worm.
- **Sabella.** - Shell composed of agglutinated grains of sand.

### IV. Zoophyta. Composite animals florescent like vegetables.

1. *With a hard calcareous stem.* Lithophytes.

- **Tubipora.** - Coral, with cylindrical tubes. - The tubipore.
- **Madrepora.** - Coral, with concave flars. - The madrepora.
- **Millepora.** - Coral, with subulate pores. - The millepora.
- **Cellepora.** - Coral, with hollow round cells. - The cellpora.
- **Ips.** - Stem flory. - The true coral.

2. *With a softer stem.*

- **Antipathes.** - Stem horny, bevel with small spines, and covered with a gelatinous fleshy coat.
- **Gorgonia.** - Stem horny, and covered with a cellular or vascular coat. - The gorgon.
- **Alcyonium.** - Stem corks. - The sac-purpurs, sea-bij, &c.
- **Spongia.** - Stem flowering, flexible, bilutus. - The sponge.
- **Flustra.** - Stem covered with minute cellular pores. - The horn-wrack, or sea-mat.
- **Tubularia.** - Stem tubular, filiform. - The coral.
- **Coralina.** - Stem with filiform calcareous joints. - The coraline.
- **Sertularia.** - Stem with filiform fibrous joints.
- **Pennatula.** - Stem coriaceous, resembling a quill. - The sea-pen.
- **Hydra.** - Stem medullus, naked. - The polype.

### V. Infusoria. Simple microscopic animalcules.

1. *With external organs.*

- **Brachionus.** - Body covered with a shell, and ciliate at the tip.
- **Vorticella.** - Body naked, and ciliate at the tip.
- **Trigonia.** - Body fleshy on one side.
- **Cercaria.** - Body rounded, and furnished with a tail.
- **Leucophora.** - Body every where ciliate.

2. *Without external organs, flattened.*

- **Gonium.** - Body angular.
- **Colpoda.** - Body flinty.
- **Paramecium.** - Body oblong.
- **Cyclophora.** - Body orbicular or ovate.

- **Bursaria.** - Body oval, like a purpurs.
- **Virgula.** - Body elongated.
- **Emphelis.** - Body cylindeous.
- **Bacillaria.** - Body composed of straight straw-like filaments, varying in position.
- **Volvox.** - Body spherical.
- **Monas.** - Body a mere point.

### Of Intestinal Worms.

The denomination, "Fomes Intestinales," given to this order by Linnaeus, is not to happily chosen as might be wished;
HELMINTHOLOGY.

341

ly for the habitations of these parasitical tribes; for which purpose a number of different animals were dissection; and the human fabric, whenever opportunity occurred, was diligently examined for the detection of them; while the enquiry and information were both most facilitated by that powerful magnifying power of the microscope. Pallas was the first to publish Diff. de Infestis, &c., attracted the public attention to this subje-
from some very important experiments and observations, tending to prove that these worms were a distinct order of beings, different from every other kind, and capable of being arranged under genera and species of their

VIII. No. 589.

The insufficiency of this conclusion induced the phy-
sicians, and adopted by the ancient philosophers, and adopted by

The opinion, that the germ or seed of every intestinal worm (feminum verminum) must be innate, was counte-
pounds of these tribes; for this purpose of endeavouring to keep intemal worms alive, after being taken from the body; but no medium has yet been discovered in which they could exist for any for two or more hours. And this was certainly the ease in the powers of digestion, rather than any ability in those animals to maintain their existence in a region for which they were never formed. In dissecting the fo-
mach of frogs, Goeze not unfrequently met with bundles of the Gordius aquaticus under different degrees of digestion; from which it appeared that the frogs had been fed on such animals as food, instead of affording them an asylum for life, and growth, and nourishment, in their intestines.

And julit fo it is that intestinal worms cannot survive their expulsion from the viscera; nor can a single instance be adduced of either acarides, teniae, falcicole, echinorhynchus, or other worms inhabiting the animal body, ever having been discovered in a living state, in any substance or matter whatsoever, out of the body. It is indeed true that Dr. Unzer, of Helmefladt, found a tapeworm in a well; and that parcels of them were also discovered in a small rivulet: the mystery of which was soon unravelled by the vigilance of Müller; for on an application to Dr. Unzer and some other persons, and after an examination of the worms, he found that the one had been voided by a child and thrown into the well; and that the others had been thrown off by a num-
erous breed of carp, which are extremely subject to them; and thus the fact was ascertained; but the worms were dead in the water, a proof that they could not live out of the region from which they were taken. Many experiments have been tried for the purpose of endeavouring to keep intestinal worms alive, after being taken from the body; but no medium has yet been discovered in which they could exist for any

45
length of time. Warm water, gravy, blood, and milk, have been tried to little purpose. In alleie-milk, warm from the animal, they are found to sustain life and motion by far the longest; and those taken out of fish will live much longer than those taken out of man or any warm-blooded animal; the reason of which is easily ascertained from the cold temperature of the bloomed fish, which renders their worms more tenacious of life in the temperature of the atmosphere.

From the great number of intestinal worms found in almost every kind of fish, particularly tapeworms, it has been suggested that this singular species might, by eating fish, be transferred to the human intestinal canal, and be the source of the cure of the worms of this kind, M. Goeze made the following experiment: To a young cock, in whole intestines the tapeworm infundibuliformis is usually found, at three different times, after thus losing their fecundity or vivifying power. The Jewels, wife, in all parts of Europe, eat large quantities of fish, which renders their worms more tenacious of life in their intestines with great care; but not a trace was found. It has indeed been estimated that in Switzerland alone, even if it had not been proved that worms peculiar to one kind of animal cannot exist in the intestines of a different animal; for in Denmark, where prodigious quantities of fish are also eaten, scarcely a single person is ever known to be troubled with this worm, and yet the rivers abound with them. The Jewels, wife, in all parts of Europe, eat large quantities of fish; yet Dr. Bloch of Berlin afferts, that after a strict enquiry among different tribes of those people, he was confidently assured that persons afflicted with tapeworms were scarcely ever heard of among the Jewish community. Besides, if it were possible for the fish-worms to be communicated to the animals which feed on fish, then every aquatic bird, and numbers of the mammals clafs, who live almost entirely on the finny tribe, would abound with those specific worms; but the truth is, that no worms except those peculiar to themselves are ever found in them; so that finny-eaters need not be under any alarm from feafood on that highly-nourishing article.

To prove that the intestinal worms peculiar to one kind of animal cannot exist in the bowels of a different kind, M. Goeze made the following experiment: To a young cock, in whose intestines the taenia infundibuliformis is usually found, at three different times, after an interval of a month, and after the cock had fasted twelve hours, he gave it three taenia ferata, taken alive on dissection from a cat, and at another time he put down several live taenia canina, which the cock picked up and swallowed greedily. At the expiration of four months Goeze killed the cock, and disected the intestines with great care; but not a trace could be discover of the worms that had been eaten; nor was the taenia infundibuliformis, or taenia pendula tapeworm, peculiar to this bird, found in him. This, with other similar experiments, and the discourse upon them, inferted in M. Goeze's very ingenious treatise, "der Liegende Annoerwer Theisscher Roper," gained him one of the prizes from the Copenhagen Royal Society; while the other was deservedly belauded on Dr. Bloch of Berlin.

It has been intimated by some writers on this curious subject, that though living worms may not, as in the above experiment, escape the trituration of the stomach, yet the ovula or eggs might; and, as the intestinal worms are supposed sometimes to cast their spawn with the feces, it is not only possible, but probable, that among wild animals, birds of prey, and the countless number of shoals of fishes, the feces may be, and in fact are, often eaten by one another; so that, whenever the fishes shall happen to be charged with the spawn or eggs of intestinal worms, these, being by very minute, and looking like the dross of mucous or mucus, escape trituration; and being thus restored to their native element in the warm intestinal canal, would be there attached to its inner coats, and in due season be hatched and matured in the body of a very different animal from its original parent. But, plausible as this hypothesis might appear, M. Goeze succeeded in disproving it, by showing that he had also given the eggs or ovula of intestinal worms, taken by dissection, to poultry, but without effect; besides that, in dissecting an infinite variety of different animals from the cold to the smallest, he constantly found the intestinal worms, which were the same in all of them, each individual having a peculiar conformity of its own adapted to that species or kind of animal only, from which he extracted it. And Goeze further remarks, that if groups of eggs, taken out of the intestines of these worms, and inferted into different animals, cannot be caused to hatch, it is impossible that such ovula, cast out upon the cold earth, or into cold water, should ever be quickened into life, after thus losing their fecundity or vivifying power.

Besides, many species of these worms are viviparous, such as the ascaris vermicularis, many of the echinocystis, cecumili, &c. which must therefore exclude their young alive into the mucus, and in this infant state they are often thrown out with the feces, and devoured by birds of many kinds; "yet, (says Goeze,) I challenge the world to produce me a single instance wherein such worm has been found alive in any creature which has not been allowed in any other species of animal besides that to which God and nature have assigned it. But, venerable as this principle is, we cannot but admire and adore the benevolent wisdom of the Creator, in fixing due bounds to the multiplication of his creatures, throughout the various orders of his admirable works;"

It is observed by professor Pallas, that from the dissection he had submitted, he was warranted in concluding, that wild beasts are most of all afflicted with worms; but the nibbling and gnawing animals, which are careful in the selection of their food, seldom; and the ruminant animals seldom. Among birds, the carnivorous, and those that live near the habitations of men, are the most infected, have them most frequently. Among fishes, the voracious, large, and long-living carp, and all such as swim in shoals, are by far the most afflicted with worms. Yet M. Goeze, on this passage of Dr. Pallas, remarks, that he himself dissected very considerable numbers of foxes, martens, ferrets, and other fowls rapacious animals, and found in them very few worms, when compared with the nibbling and gnawing kind, which pick their food carefully and choice. The woodcock, he says, and the granivorous birds, are very clean feeders, yet he discovered a number of taenia in dissecting the woodcock, and a still greater number in the intestines of a partridge. In lambs, sheep, hares, conies, &c. he found taenia, and other worms of various kinds; but in the following, which are by far the fairest feeders, he constantly observed the least number of worms.

"To conclude, (says M. Goeze,) since we find families of intestinal worms inhabiting more or less the bodies of all animals which we have hitherto dissected; and since these families seem to resolve themselves into groups of individuals of the same species, or kind, we cannot but admire the ingenuity of the Creator in disposing these worms in different orders into which we divide the animal creation, and are constant in their figure, habitudes, and economy, in each of those animals to which they belong; it seems to me to be most conformant to reason, as well as most compatible
compatible with the ordinances of Providence, to believe, that all intestinal worms have their origin or germ formed in the fetus of every animal which produces them; that their office in the intestines must be primarily a beneficial and benevolent purpose assigned to them by the Creator, although the discriminating powers of man have not hitherto been able to penetrate them; that their habitation in the body is never injurious, but when other causes predispose to their excitative multiplication, such as morbid affections in the viscera and parts adjacent, or the accommodation of particular mucus in the bowels, edematous tumours, &c., a tendency to all which lies in the constitution, or in the influence of different epidemic complaints, rather than in the effect of worms; since very many people live to the grand climacteric, and even beyond it, and are accompanied with worms to the very last. In support of this doctrine of Goeze, it may not be improper to notice, that Dr. Heberden found worms in the intestines of an infant born dead.

The immortal naturalist, Sir Charles Linnaeus, availed himself of all the discoveries of his contemporaneous labourers in this field of science, in order to form that admirable compendium of the stupendous works of the Creator, known by the title of Systema naturae; but to which, since that great man sunk into the grave in the year 1778, prodigious numbers of newly-discovered intestinal worms have been added, by the well-known editor of the late editions of that excellent work, Dr. I. Frederic Gmelin of Gottingen. But in the animals of this class now brought within the sphere of our knowledge, none are found to be such general inhabitants of the human race, as

The Ascarides. These generally exist in the greatest numbers in children; whence it has been inferred, that by their ceaseless irritating action upon the interior membranes, they promote the peristaltic motion of the intestines, by which the excrements are pressed down and excluded, and the passages of the body kept open; which is so essential to its healthful state. Their proper nidus, according to Dr. Heberden, is in the mucus or slime destined toIC warfare, which has taken sufficient care that their seeds should find the way thither. If the ascarides are taken out of their mucus, and exposed to the open air, they become motionless, and die in a very short time; but in general they are so well defended by the mucus from the immediate action of whatever poisons the intestines, that they are rarely incommunicated in their nidus, unless they exist in great numbers. From these observations of Dr. Heberden, we may easily perceive why it is so difficult to destroy these animals; and why anthelmintics, though greatly celebrated, are far from always being specific.

As the worms which reside in the cavities of the body are never exposed to the air, by which all other living creatures are invigorated, it is evident, that in themselves they must be the most tender and easily destructible creatures imaginable, and much less will be requisite for their destruction than for the destruction of any common insect. Yet, (says Dr. Heberden,) by being immersed in slime, these worms are the most difficult to kill of any, and are yet the least dangerous of all. They have been known to accompany a person through the whole of a long life, without any reason to suspect that they had hardened its end; and as in this man's case there was no remarkable indigestion, giddiness, pain of the bowels, or itching of the nofe, the usual prognostics of worms, possibly these symptoms, where they have happened to be joined with the ascarides, did not properly belong to them, but arose from some other causes. There is indeed no one sign of these worms, but what in some patients will be wanting.

In the human body, only two species of ascarides have as yet been found, viz. the vermicularis, or small kind; and the lumbricoides, generally about a span in length, but sometimes a foot, or more. This long round worm of the human intestines, (says Dr. Hooper,) has, for many centuries, been considered of the same species as the earth or loth-worm; the fallacy of which I have therefore thought proper to demonstrate. The lumbricoides, earth-worm, has but one ovula at its head, in the middle of which is its mouth; it is flattened towards the tail, and is furnished with sharp bristles on its under surface, that serve it for feet, which the animal can erect or depress at pleasure; its annular muscles are very large and strongly marked, and its colour is a dusky red. Whereas the ascaris lumbricoides has none of these phenomena. Its colour is a pale yellow; its muscles very delicate, and its head is furnished with three vesicles instead of one. Upon the under surface of the earth-worm there is a large semilunar fold in the skin, into which the animal can draw its head, or thrust it out at will; but there is no such form in the ascaris lumbricoides; the female also has an elevated belt in its middle, but in the latter there is a sharply defined band. On each side of the ascaris lumbricoides there is a longitudinal line very distinctly marked; on the earth-worm there are three lines upon its upper surface.

With respect to the other species, ofcaris vermicularis, this is not, as is the generally-received opinion, hermaphrodite; but the male and female are distinct worms. The male, when exposed to the magnifying power, does not exhibit any of the gyrated apparatus, which, in the female, is decidedly for the purpose of bringing the young to perfection. The earthworm being an ovum; a different arrangement from those of the female, and are the only viscera I have been able to detect. I have searched for the male organs of generation, but have never been fortunate enough to find them. Perhaps they are so very minute as to elude our researches. The female has, upon its external surface, about the eighth of an inch from the head, a small punctiform aperture through which the young are protruded. When the worm is very much magnified, its internal cavity appears divided into two principal parts, for the reception of the sexes; and I have seen upwards of a hundred of the young escape through the external aperture, all alive, and very vivacious, several hours after the death of the mother, upon making a slight pressure with the finger.

So widely diffused are the worms of this genus, that besides the two described above as proper to man, no less than seventy-eight other species have been ascertained, as proper to the intestines of different animals; for particulars of which see the article A SCARIS, vol. i. p. 251, and the correspondent Engraving, whereon fifteen of the most curious and interesting species are correctly delineated.

The Taenia, or Tape worm. This genus is confessedly the most surprising of all the worm tribe, and demands the strictest scrutiny of physiologists and physicians. They are extremely tenacious of life, and very difficult to remove; and when broken, have the power of reproducing the same. They appear to inhabit the intestines of most of the animals which have hitherto been deflected for the purpose of detecting them; in all of which they are perfectly analogous to those found in the human subject, though differing in all their structure. There are two divisions of them; one round or globular, and from the size of a
grain of sand to the bulk of an orange; commonly called hydatids; the other long and flat, and much resembles a piece of taste, whence it derived its vulgar name. Both kinds are oviparous, and astonishingly prolific; though in other circumstances they differ exceedingly, not only in shape, size, and form, but in their destination in the animal frame.

The structure of the tapeworm is extremely curious; but the latter most is its incredible length. They have been voided in England from fifteen to thirty feet long; but some are said to measure sixty feet, and Boerhaave expressly mentions his having met with one not less than thirty feet in length. There appear to be three species of this worm incident to man: the *taenia solium*, said to be endemic in Great Britain, Saxony, and Holland; the *taenia saginata*, in Switzerland and Russia. This singularity, perhaps, may not be strictly founded; but from the observations of different naturalists and physicians, as far as experience can warrant, the fact is generally thus stated.

*That these worms should be created for the purpose of producing disease in the animal which they inhabit* is a question that would not readily be answered, (Linn. Trans. vol. ii. p. 248,) that nature has not provided any situation to be vacant, where it was possible to multiply the scale of living beings. Perhaps, therefore, a certain proportion of these animals may be conductive to health, just as a certain proportion of different fluids is so; whilst an excessive increase always produces disease. It is however not to be doubted but that worms, and especially the *taenia*, do sometimes produce disfigured states of the bodies which they inhabit; though we are also well assured that worms do exist abundantly in many animals without at all disturbing their functions, or giving them the smallest annoyance. It should also be considered that many states of the animal body are highly favourable to the increase of worms; as dropy to that of hydatids, and the rot in fleec to that of the Fasciola hepatica or gourd-worm.

The *taenia solium* is very correctly described by Dr. Hooper, in the fifth volume of the *Mem. Med. Soc. Lond.* 1779, as follows: The head is placed at the smallest extremity of the worm, and resembles an external eye. The rest of the joint is composed of a thick muscular wall, which is very porous and elastic, and which seems, from some experiments, to be endowed with nervous power. The head, therefore, has no cuticle. The head is made up, like the other parts of the worm, of cutis and muscular fibres. The fibres, however, are not in any regular order, but appear to run in every direction, and are united together by a connexing cellular membrane.

The alimentary canal enters the structure of the head, at the base of which it divides into two distinct tubes, which are continued near the margins from one extremity to the other, and in the extreme joint, where it is impervious, there being no opening analogous to the orifice of the mouth. The alimentary canal, being firmly attached to a kind of ligamentous band, and placed along the articulatory receiving margin to the caecum.

When the cutis is removed, the muscles of the worm are laid bare. They are of a white colour, very much resembling the esophageal lumen, and are divided into two orders, evident to the naked-eye. 1. The longitudinal muscles, which run the length of the joint, and are united together by a connexing cellular membrane. The head contains also within it the beginning of the alimentary canal, which originates from the mouth by a simple tube or cesophagus, which bifurcates near the base of the proboscis. This bifurcated alimentary tube proceeds from the head near each margin of the worm to the other extremity. Through this canal the animal conveys the food to every part for its growth and increase.

Order of Vermes Intestinatae. — Tapeworms.
ated between the longitudinal canals, occupying the middle of the worm. It is always disposed in an arborescent manner, from its resemblance to a tree, being composed of a middle canal or trunk, and lateral ramifications; an articulation of which is shown in the engraving at c. There is a communication between this arrangement of vessels and the ocellum on the margin, by means of an intermediate canal, which, in some joints, is filled with a brown matter. The ovaria are generally filled with an opaque fluid, very like chyle, which is said to contain ova.

In some joints, and most of these near the tail of the worm (for these are generally more transparent than the rest), this circumstance is evident to the naked eye, especially if the joint be placed on blue paper. If one of the ovaria be taken out of the canals and subjected to the microscope, it is said to exhibit ova of different sizes, from the largest of which very slender taeniae have been seen to escape upon rupturing its ovum, and contorted in a spiral form, and having conspicuous traces of articulations, and one extremity accumulated, the other obtusely broad. This experiment was made by Goeze, and is shown in the engraving at g.

The joint next to the head is received into the basis of the head, and in like manner, receives the beginning of the next joint, which order is observed throughout the whole extent of the worm. Thus the inferior margin of joint, or that towards the tail, is called the receiving articulatory margin, to which the longitudinal muscles are attached, which firmly embraces the next joint. This margin may always be known from the other by its being larger, and by its being fringed, whereas the other is plain, and somewhat rounded.

The joints of the taenia folium are very easily separated from each other with the animal alive. This separation is effected either by the peristaltic motion of the intestines, or, perhaps, spontaneously. Each joint thus detached from the mother worm, has the power of retaining, for a considerable time, its living principle, and is called, from its resemblance to the food of the animal, vermis cucurbitinus. This phenomenon has given rise to many warm disputes; several authors have denied their being portions of taenia, and have affirmed that they were distinct worms. The separated joints do not appear capable of retaining their situation for any length of time; they were few hours detached from the tube, and at length creep out, or are expelled, per annum.

"I knew a man, (says Dr. Hooper,) who had been for some time troubled with this species of taenia; whenever he took an expectorated medicine, he voided upwards of forty detached joints with his faeces; and, attentively preserved. Of fourteen years, was affected with pains in her stomach, head, rigors, &c. which symptoms continued and increased; and she was gradually increased. At the age of nineteen she came to England, and was advised to take purging medicines, by which she voided a portion of taenia lata, the species endemic in her country. She continued for some years to take drastic purges, and repeatedly voided portions of this taenia, which were generally about two yards in length; she died at different times, twelve of these pieces, but none of them had that extreme joint which is considered to be the head. About eight years after her coming to England, she took the Swallow medicine, and afterwards the head, together with a large portion of the animal's body, were evacuated; she then perfectly recovered her health. From the foregoing history, it is probable that the head of this taenia had exsised for the space of twelve or thirteen years; or, if she had voided a head previous to her arrival in this country, we may still suppose the perfect animal to have lived eight years, because during this last period the circumstances of her case were accurately and attentively preserved.

It is a curious circumstance in the account of this woman, that she felt herself considerably relieved from all her unsteady symptoms after voiding each portion of this taenia; but in the course of three weeks they always returned as before, and were not alleviated until she voided another portion. It is therefore almost manifest that the body of the taenia was gradually regenerated, after each piece above-mentioned had been broken off; and that the symptoms returned and kept pace with the growth of the worm; its extension along the alimentary canal, and its attachments there, must have proved a source of irritation proportioned to its length.

The compiler of the present article cannot forbear to mention in this place, the remarkable circumstances of a taenia which, for upwards of twenty years, oppressed the health of a patient in the Isle of Wight:—Mr. Peter Milligan, a bookseller, in the town of Newport. How long it might previously have had a place in the habit, is uncertain; but for the space of twenty years he was conscious of the presence of this creature. Being naturally of a robust constitution, and of a tall athletic make, he had long noticed an odd and painful sensation in the region of the stomach, the jejunum, and ileum, without complaint, or fulmination of the caudal. With a mind superior to the apprehensions of alarm, he had not borne
borne with these occasional pains and disturbances in the bowels for upwards of fifteen years, when, by great accident, he discovered that a piece of tapeworm was voided in his stool. Feeling, however, no disposition to apply for medical advice, as it is too often the case with persons of vigorous constitutions, he went on for five years more, occasionally feeling himself sometimes better and sometimes worse, till his flesh wasted, and his strength and spirits were considerably impaired. The pain in the abdomen was at times so insupportable when fasting or lying prostrate, that he had accustomed himself to continue very long in bed, which doubled the evident wale of body. In this stage of the complaint, he submitted to a course of medicines, which occasionally brought away pieces of the worm, and partially relieved him; but at length a much stronger helminthic was deemed requisite; and, at the expiration of four months from the commencement of the cure, it brought away the whole residue of the worm, measuring fifteen feet seven inches. The patient confessed himself wonderfully relieved; but till his health declined. He felt a sensation of coldness and vacancy under the pit of the stomach, which, in all probability, arises from living on the chyme, or residue of the worm, measuring fifteen feet seven inches. The ofcula are believed to be viscera, subservient to the propagation of the species, and they have been proved to give exit to the ovula. This is the opinion of Dr. Hooper: and the ingenious Mr. Carlyle, in his Paper published in the Linnean Transactions, says, "In a tænia which I obtained before it was dead, I observed, at one part where it had formed a knot upon itself, that two parts of the stoma were in contact with the intestine, and were deglutinated together by viscid mucus. I was not at that time aware of the possible nature of this connexion, and neglected preserving them in that state. I now suspect, however, that they were in the act of copulation, and that a mutual influence takes place previously to the formation of ova."

The annexed Helminthology Plate I. is calculated to show the construction of the Linnean order of Vermes Intestinales, as far as relates to tapeworms. Fig. 1, represents the upper part of the tænia solium, which is endemic in England; the ofcula or pores on its sides constitute its specific characters. A portion of the worm is shown at 2, with the cutis and muscles removed, in order to exhibit the vascular structure or ramifications of the ovaria, as they appear upon each individual articulation. At 3, the head or front of the worm is shown greatly magnified, to demonstrate the apparatus of mouth, suckers, and double rows of laciniae or hooks, by which the animal holds itself securely in its place at the upper end of the small intestines, where it is supposes to pass no farther, either as food or faeces, for want of being furnished with double marginal ofcula or pores for the exclusion of their eggs. The head-end is shown greatly magnified at 4. This is from a dissection of Goze; and belongs to that division of tænia called unarmed, as having no laciniae, or hooks.

Fig. 5, exhibits a specimen of the tænia ovina, which inhabits the intestinal canal of sheep, and is found from eighty to two hundred feet in length; a, the head-end; b, the tail-end. Those are extremely fertile, and are furnished with double marginal ofcula or pores for the exclusion of their eggs. The head-end is shown greatly magnified at 6. This is from a dissection of M. Goze; and belongs to that division of tænia called armed, as having no laciniae, or hooks.

Fig. 7, furnishes a very curious exhibition of a piece of the intestines of a cock, infested with tænia infundibuli-fermata, from a dissection of M. Goze. Fig. 8, is a magnified specimen of this worm, to show its funnel-shaped articulations; a, the head-end; b, the tail-end. At 7, the head is greatly magnified, to exhibit its proboscis armed with very sharp recurved hooks. At 8, is shown a portion of the ovula of this curious species. Fig. 9, represents the tænia anseris, a very slender worm, found in the intestines of geese; a, the head-end; b, the tail-end. Fig. 10, is the tænia lancolata, which inhabits the intestines of the duck; a, the head-end; b, the tail-end. At 9, the head is shown magnified; having somewhat the appearance of a wart. For further information, and more figures, see the article Tænia.

Of the HYDATIDS.

These creatures being of a vesicular form, shaped like small aqueous bladders, and betraying no visible sign of animation, their appearance in the human body has been considered, till very lately, as a particular disease, and placed by Dr. Cullen under the clathra of the animal spirits. The tumours, however, is found to possess an independent state of life, and to be able to detach itself, at certain periods, from most of the situations in which it is found. Its head, like those of the other tænia, is furnished with a kind of tube; also with four papillae, which perform the office of suckers; and a double series of laciniae or hooks to hold them in their place. Each of these points of which turn towards the neck, and are so arranged, that in the first series they are larger than in the second. Their colour is a slight red, and their constitution considerably firm. The papilla fortescentes, or suckers, are placed round the head in such a manner, that it appears to be divided into four equal parts, each of which is furnished with an elevated margin, perforated in the centre, manifestly forming a mouth. From these mouths, four canals
cians take their origin, which pass along the neck and body in parallel lines; but towards the extremity they become fo pellucid and evanescent, in the more minute species, as to escape the microscope. Its principal difference from other teneine, confists in its membranous vesicular expansion, which externally appears to constitute its whole form, and in which the head and other parts are enveloped, and, as it is observed, the remains of hydatids? but that must be determined from the concurrence of symptoms; for it is never found in the intestines, but on the surface of the vifera, on the membranes, and sometimes enveloped in the fat. In every other respect they are the same; yet it is not surprifing that its nature has so long been overlooked, fince it is sometimes difficult to difcern the head, unless it be in the lumen of the vessel or in the fat, or in the fpringy parts of the body, where the skin is thin or lacerated.

Dr. Tyson firft discovered hydatids in the livers of sheep; Bartholine observed them in the livers of goats, and Pyerus in hogs. To Pallas, however, we are indebted for the firft correct and connected account of these animals, which he has defcribed and figured in his Miscellanea Zoologica. After his publication, Goeze, Buffon, Bloch, and others, have added considerably to the flock of information. They found that hydatids are, in general, superficial; that is, some portion is enveloped in the fubflance of the liver, for inf麻醉te, and a part rises above it. Yet this is not an universal rule; for, as they are very numerous, some of them muft be without exception. They foftly burrow in the fat, and are entirely covered, and can never change their place. Their fize differs according to their age, and the temperament of the animal at whose expepence they live. Pallas speaks of fome as large as the fit, and others fift more bulky. Their figure is infinitely varied, but generally approaches that of a flattened fphere. Their colour is generally yellow with white, or fomewhat converfed, fometimes flietly red, or of an amber colour; their fubflance is composed of different membranes, conglutinated, and formed of circular fibres, visible by means of a lens, but in many animals, particularly in fleep, they are fufceptible of an evident contractile power. Internally, on the part opposite to the head, we obferve a disc, fomewhat thicker than the membrane, with ofen a number of fatty tubercles, which are fuppoft to be eggs. They are filled, though not wholly, with lymph, ufually tranfparant, of an oily falt tait, which becomes cloudy by heat. These vehicles are obferved to have a motion of their own, which muft be fubjefts to the law of centripetal force. Thofe when in the fteep, they are fufceptible of an evident contractile power. Internally, on the part opposite to the head, we obferve a disc, fomewhat thicker than the membrane, with ofen a number of fatty tubercles, which are fuppoft to be eggs. Internally, on the part opposite to the head, we observe a disc, somently thicker than the membrane, with ofen a number of fatty tubercles, which are suppoft to be eggs. They are filled, though not wholly, with lymph, usu
surface of a bag or fasc, which is firmly attached to the neighbouring parts, and covered with a strong outer coat. It is obvious that the progress of growth is very unequal in these two, and indeed inverted; for in the first the young ones are as large as the heads of pins, while the parent bag is not larger than a wall-clock. As they float unattached; but on the contrary, in the second there is a large fasc with a strong outer coat, and a more tender inner one, adhering strongly to the surrounding parts, while the young ones, that are very slightly attached to its fides, are not of a larger diameter than a 258 part of an inch. Whether these are merely accidental dilatements in the growth, or depend upon some more essential distinction, must remain to be determined by future observations. However their growth and decay evidently explain the increase and diminution of tumours in the abdomen containing them. In the present case, Dr. Hunter thinks that their origin was prospective; for in the second case, Dr. Hunter thinks that their origin was prospective; for in the more essential distinction, must remain to be determined float unattached; but on the contrary, in the second

...however, are evidently young hydatids. In the Helminthology Plate II., at fig. 1, are given, three views of the *tencia visceralis*, or visceral hydatid: the first shows the animal with its head protruded, and the coronary of laciniae or retractile holders exerted; the second exhibits the hydatid in a quiescent state, with its head drawn within the vesicle, broad on the forepart, and pointed behind; the third is a longitudinal section of the vesicle.

Fig. 2, is a very beautiful representation of the *tencia cerebralis hominis*, as given in the introduces volume of Goeze's Engraved-wormer. It was extracted from the brain of a young woman dissected by prof. Mec-

...in Germany it is very common; and, according to Blumenbach, oppresses sickly children with their numbers, occupying the intestinum rectum, the inferior part of the ileum, and also the jejunum. They are usually about two inches long, but that delineated in the annexed Engraving, at fig. 21, as given by M. Goeze, is very considerably magnified, in order to show its create conformation, probodics, &c. The stomach and intestines consist of a long greenish canal, which is continued in a straight tube from head to tail, where it terminates in the anus. The convoluted or zigzag vicus is the ovis, found to contain a limpid fluid, the accompaniment of the ovula. Besides the hominis, there are five other species of this worm, found in the intestines of the horse, boar, fox, mongoose, and lizard; for which see the article Trichocephalus.

There appears to be only one more worm, at present known, that inhabits the human intestines; though there is a great variety of others found in the internal animal. This is the well-known gourd-worm or fluke, found in rotten sheep. See the article Fasciola, vol. vii. p. 267. It is also found in the decayed...
Order of Vermes Intestinales. — Hydatids, Trichocephalus, Scolex, &c.
cayed liver of such persons as die in lingering consumptions, and greatly emaciated; though not always so. Leuwenhock was deceived when he attributed eyes to this intestinal worm. What he took for eyes, are the tubercles analogous to the lateral pores of this order of animals, which seem to be calculated partly for attaching the head during the act of swallowing, and partly for the work of generation, as noticed above in the tetania. At fig. 19, a correct delineation of this worm is given. Its elongated oval flat form occasioned it the popular name of flower; the upper extremity terminates in a narrow neck, having an orifice or opening at its end, which is the mouth. At the root of the neck appears the tubercle to convey to the interior of the hare. The head of one of these worms is the popular name of Filaria, (Filaria medi- nens, &c.) called also drankeworm; for particulars of which, see the article Filaria, vol. vii. p. 366, and the corresponding Engraving. The Solen is the most minute of all the intestinal worms, being an animalcule which, in its contracted state, eludes our observation without the help of the microscope. It is nevertheless a most vivacious little creature, possessing the faculty of assuming a number of different shapes and sizes, sometimes linear and elongated, as shown in the Engraving at fig. 14, greatly magnified; and sometimes wrinkled and short, but always broadened on the forepart, and pointed behind, as shown at e. They have been found only in the bodies of insects such as turbot, sole, plaice, &c. and are contained in a small gelatinous bag, in which they appear to the naked eye like so many obscure points, as shown in the Engraving at f; but when taken out of the mucous bag, they appear as at g.

The Echinorhynchi are among the most fertile of the vermes intestinales; but they have not yet been found to inhabit the bowels of man. The most common of these worms is the gige, so prevalent in the intestines of swine. A cluster of them is shown at fig. 17, attached to a piece of intestine dissected off by M. Goeze. The largest species is that found in the boar, generally a foot and a half long, cylindrical, and of a bluish cast, shown in the Engraving at fig. 18. They are armed with many circles of retractile prickles or holders, fet round the proboscis, correctly exhibited at h, as they appear under the magnifier. For other figures and particulars, see the article Echinorhynchus, vol. vi. p. 227.

Uncinaria, is a genus which contains two species of small filiform worms, of the nature of the Acanrides; found in the intestines of the hog and hog. The genus Ligula, also contains two species; one found in files, and the other in the guilemout, and merganer. This is about a foot long, exactly resembling a piece of tape. Strongylus, contains likewise two species, found in the stomach of hares, and of sheep; it is a long round worm, containing only one species, found in mice.

The genus Cestodes contains species which infest the intestines of many animals; but has never yet been found in man. They are mostly viviparous, spirally convoluted, and the head is furrowed with a kind of canal. The Taenia, commonly found in salmon, is delineated at fig. 20, as it appears on a side view imbedded in the liver; another section of the liver is exhibited at i, showing the head at rest, in its hood.

The Cercopithes, is a small round worm found in carp, tench, bream, &c. The Ligu/a, inhabits the intestines of the hare and rabbit; and the genus Phascolus contains a small gelatinous sea-worm, which, like the Filaria, burrows under the skin.

The genera clauded under this order, which never enter the bodies of other animals but by accidents, are, Gordius, the hair or water-worm. Hirudo, the leech, an inhabitant of moist countries, in ditches, ponds, rivulets, &c. Lambsda, the earth-worm, dew-worm, lob, &c. found in almost all soils over all the earth. Stentor, the tube-worm, an inhabitant of all the seas. Bicouna, a small gelatinous sea-worm, which appears to be the connecting link between this order and the next. For figures, with the natural history, of these worms, see under the respective names in this work.

MOLLUSCÆ, or GELATINOUS WORMS.

In contemplating this order of Vermes, one is at a loss which most to admire, the beautiful variety of their form—the brilliant transparency of their colours—the splendour of their phosphoric light—or the extensive gradation observable in their size, advancing from the minutest of a pepper-corn, to the unwieldy bulk of the Medusa, a creature the size of an elephant. The genus Echinus, of the Medusa genus, and the pulpy motion with which they fall through the water, have been deservedly celebrated by poets, and other writers. The Echinus, for the rich and numerous tints of its coriaceous covering, is scarcely to be equalled by the choicest of the insect tribes; as might likewise be said of some other genera, particularly the Acidia, Holothuria, Actina, Amphitrite, and Astéria; all which see under their respective names, with the Engravings corresponding to them. The substance of these animals, being mostly soft, and of the nature of jelly, becomes a nutritious as well as plentiful food for fish; as do some of the species for man.

To illustrate the construction of this order, we have, in the Helminthology Plate III. exhibited specimens of some of the smallest, contrasted with one of the largest, animals belonging to it. This is that curious and singular creature, the Sepia leghio, commonly called the great cuttle-fish, represented at fig. 1. It is furnished with eight braschi or arms, interposed on the interior side with little round serrated cups, acting as tentacula, by the contraction of which the animal lays fast hold of any thing that comes in its way. Besides these eight arms, it has two braschi longer than the other arms, and also pedunculated. The mouth is situated in the centre, and is horsey, and hooked like the bill of a parrot. The eyes are below and projecting, surrounded with several silvery rings; they are as large as the eyes of a calf. The body is fleshy and of a reddish and yellowish brown colour. With their arms and trunks they fatten themselves, to refist the motion of the waves. The females lay their eggs upon sea-weed and plants, in clusters like bunches of grapes. Immediately after they are laid they are white, and the males pass over them and impregnate them with a black liquor, after which they grow larger, and resemble black grapes, as shown in the Engravings at a. On opening the egg, the embryo cuttle is found alive. The noise of a cuttle-fish, on being dragged out of the water, resembles the grunting of a boar. When the male is pursu’d by the fea-
wolf or other ravenous fish, he thus the danger by atragem. He squirts out a black liquor, by which the water becomes black as ink, under shelter of which he baffles the pursuit of his enemy. This black liquor has been deemed to be produced by M. le Cat, but is elaborated in a particular gland. The Romans used it as ink; and it is said to be an ingredient in the composition of Indian ink. The back-bone of this animal is converted into that useful article of stationary called pounce. In hot climates these creatures are found of an enormous size. The Indians affirm, that some have been seen two fathoms broad over their centre, and each round the West-Indiay Islands; and with equal ease destroys the piles and timbers of wharfs. It is found in most seas.

Nais, is a small harmless worm, inhabiting flagrant waters, sea-weeds, &c.

Actinia, is a fixed cylindrical animal, with surpising retractile and expansive powers, furnished with a circular arrangement of tentacula placed round a central mouth in the form of beads, which from their form and colour have the exact resemblance of a flower. The various species of this genus furnish the flower-garden of the sea; and are named carnations, anemonies, marigolds, &c., according to the colour and form of their tentacula, either in an expanded or contracted state: the latter are often seen in the moonlight unveiling a central gold disk, surrounded by a circle of red globules, which are scarcely to be distinguished without the help of the microscope.

Fig. 2, in the preceding Engraving, represents the Medusa hemipheria, in its quiescent state, and of its natural size. Its appearance is that of a drop of transparent jelly, and 50 minute at the red globules of the tentacula which surround the disc, that they are scarcely to be distinguished without the help of the microscope. Yet has this little creature, when it falls in quest of food, the faculty of expanding its tentacula or arms to a size equal to that which is shown at fig. 3.

For figures of larger and more elegant species, see the Engraving adapted to the article Medusa.

The Sepia, or flag, is confidered the most simple as well as most humble of this order of vermes; and being universally known, affords a ready comprehenion of the limy nature and retractile quality of the flesh of these animals, which can expand or contract at pleasure.

Onchidium, is the flag of Bengal, of a greenish ash-colour, and with the mouth below, and each end of the tentacula which surround the disc, they are retractile; and it can expand or contract its body at pleasure.

Lepidella, is a very singular mishapen mafs, enveloped in a loose skin when touched it discharges a black sure.—See the curious engravings adapted to the article Holothuria.

Lobaria, is a worm rarely met with; and is thus named from having its tail composed of four lobes.

Triton, is a small worm, distinguished by a long spiral proboscis, and twelve ciliate tentacula.

Lernae, is a very curious genus, having a kind of oblong naked body; head defilute of eyes, but furnished with strong branched tentacula or horns, by which it inimicates itself between the gills of fish, and there robs its nourishment. Its ovaries are external, produced like two tails from the lower extremity, and it glues on the check of the fish whereto it adheres, and there the young are hatched. It is said to be extremely troublesome to most species of cod-fish.—See this worm correctly delineated in the Helminthology Plate III. fig. 6, with the ovaries in an advanced state of pregnancy.

The genus Clio forms a very curious little family in this order: they are quite small, being only met with from the size of a pea to about an inch in length. They are furnished with a kind of sheath, from which they protrude their body, and retract it again, as it beats itself out of its sheath. They possess a dilatable membrane on each side, in the shape of wings, which gives them the appearance of an insect, but which serves them as fans.
SCYLLA, is also very small, with a compressed body, and three retractile tentacula on each side: they are generally attached to sea-weed.

This genus, is an animal of calcifying a lump of jelly, without head or eyes; it however protrudes an arm from the angles of the body, each of which is furnished with from thirty to forty tentacula, retractile, and employed in catching its prey, which it turns into an office in the centre of its mass of body.

Physosphaera, is a very curious little creature, hanging pendant from an aerial vehicle, with feliee numerates at the sides, and radiated tentacula beneath, whereby it has the appearance of a full-blowed flower hanging downwards.

Clava, is a small fixed animal, with no other motion than what is afforded by its dilatate muscles, which enable it to erect its body; having a vertical mouth at the top, fed by a border of tentacula, which gives it the appearance of a flower.

Salpa, is a worm of an elongated form, inclosed in a tube, open at each extremity. They are of a gregarious nature, and swim in company with great facility; possessing the power of contracting or opening at pleasure the cavity of their extremities: they are very transpandable, with a few peculiar advantages in the shape of the tentacula, by which they are also called sea-flas, and are by that character instantly known to belong to this genus. We have described them at large under the article Asterias, vol. ii, p. 300-302; where the most curious species of them are engraved on the correspondent plates.

But of all the genera comprised in the order of Mollusks, the greatest variety of beautiful tints and curious forms is produced by the Echins, many of which are highly valuable in collections. We have described no less than one hundred and nine species, (all as yet known,) and given plates of the most rare and thriving individuals, in our sixth volume, p. 227-234, to which we beg to refer the reader. All the other genera are in like manner described under their several titles; and as in the former plates of shells, we have endeavored to give in this work, where engraving are given of the most interesting species belonging to each genus.

TESTACEOUS, OR SHELL WORMS.

This extensive order of Verms, gave birth to the elegant science of Conchology, or methodical arrangement of shells; and from one of its genera, the Argonaut, or nautilus, it is even said that navigation, or the art of steering a ship at sea, first took its rise; whence the allusion in Pope:

"Learn of the little Nautilus to sail."

The animals which form this order are of a simple structure, gelatinous, and soft, being no other than Mollusks, from the generation of a calcareous habitation, the rudiments of which being formed in their egg-bodies, they carry it with them throughout the whole of their lives. Some of them are distinguished by shells formed of several segments or valves, whence they are denominated multivalves. Others, whole habitation confits of two shells, as the mufcul, oyster, and cockle, kinds, are termed bivalves; and those which have only one shell, are called univalves. These three classes are subdivided into genera, which are formed upon characteristic distinctions, arising in the first class from the form and number of the valves; in the second from the number and kind of articulations in the hinge; and in the third from their spiral turn, form of the aperture or mouth, teeth, spiral, &c. See the article Conchology, vol. v. p. 14-51.

In the artificial arrangement of shells, it has been the custom of most conchologists to begin with the univalves, and to end with the multivalves; but Linnaeus, in the order of this order of the animals which inhabit the shells, has quite reversed the method, beginning with the multivalves and ending with the univalves. For this arbitrary deviation, as well as for mixing and incorporating so many shells of adverse shapes and different forms in the same genus, Linnaeus has been called a bad conchologist, and subjected to much cenere; but certainly with our reason, since his general characters hold firily throughout the whole, and hence afford unerring criterion of affinity and family connexion, the great object of his classification. And with respect to his being a bad conchologist, his own declaration on this point should be known, viz. "that he would leave the whole order of Testacea untouched, if he could not get at the animals, rather than content himself with describing their mere houses." Hence it is obvious that his enquiries, as a great naturalist, were directed to the habits and economy of the living animal, and not, as a conchologist, to dead matter, or the exterior of a shell. See Linnaean Transactions, vol. ii. p. 135.

His first genus, in the order of Testacea, is the Chiton, or confiting of many valves, and its inhabitant a doris. They are found in almost every sea; and consist of twenty-eight species; one of which, chiton magellanicus, is delineated in the Conchology Plate XV. fig. 4. vol. v.

Lepas, is a genus of multivalves, confiting of thirty-two species, divided into two classes, viz. balani, or barnacles, and anatifere, or barnacles. The balani, covered with many unequal effe valves, which produce a singular appearance. The most curious of them is the lepas anatifere, or barnacle goose, exhibited in the above-mentioned Conchology Plate, fig. 6, 7, and 19, which is the most rare variety. The balani, or barnacles, are of different species; as the Indian crown, (lepas mitella,) shown at fig. 5; and a bunch of barnacles at fig. 4. They are found plentifully on the British shores, and on the sea-coads of every country.

Pholas, is the third and last genus of the multi valves; in which there are twelve species. Linnaeus calls ita bivalve, with accessory valves at the hinges. The animal is an acidia, which has the singular property of infinuating itself, while young, into solid porous substances, as wood, and as it increases in size it enlarges its habitation within, and thus at length becomes imprisoned. These animals were formerly called piddocks; and are furnished with a phosphoric liquor of great brilliancy, which illuminates whatever it touches or happens to fall upon. A back and front view of the pholus dactylus is given in the above-mentioned engraving, at fig. 4, and 19. For the curious habits and natural history of this singular genus, see the article Pholas.

WITH BIVALVE SHELLS.

Of these there are fourteen genera, exhibiting a great variety of different forms, and splendid colours. The Mya, or pearl-oyster, is an acidia; and the species of this genus were ranked by Linnaeus in the first part of their kind. They refuse chiefly at the bottom of the waters they inhabit, burying themselves, like the mussels, in the sand, clay, or mud; and hence the fishing for them is attended with considerable difficulty. There are twenty-five species; the most valued of which is the mya margaritifera, or true pearl-oyster.

Solae, is a genus in which the inhabitant is also an acidia, commonly called the razors, or knife-handle, from the elongated form of its shell, many of which are very beautiful. There are twenty-three species; one of which, the solae radiatus, is correctly delineated in the Conchology Plate XV. fig. 5. The Linnaean folens are divided by foreign writers into three different genera, two of which comprehend the recent kinds; the third is established chiefly for the reception of some fossil shells, supposed
supposed to be of this family. These genera are folen, sanguinolaria, and corbula. The folens, according to those writers, have the shells truncaferve, with the upper margin of the flat corded, in a straight line; the two valves together furnishing either two or three teeth in the hinge. Sanguinolaria differs in having the upper margin curved, the extremities a little gaping, and two approximate teeth in each valve, which lock into each other when the shell is closed. Corbula has the valves unequal, subtruncaferve, and the upper margin flat; there is one curved tooth in each valve; the ligament of the hinge within, and the inside of the shell, marked with two muscular impressions.

Tellina, a numerous genus, containing ninety-four species, found universally. The animal is a tethys, with shells of an ovate compressed form; one of which, the tellina radiata, is shown in the above-mentioned engraving at fig. 4, and valued for its beautiful striated ornamented furrows and striares. Cardium, a genus which comprises the extensive family of cockles. There are fifty-two species now ascertained. The animal is a tethys; and its shell is longitudinally ribbed, many of them beautifully tinted, heart-shaped, and befit with spines. The cardium sanctum, is delineated in the Engraving above referred to, at fig. 7.

Mactra, is commonly known by the name of potelucid offer, from the thinness of its shell, which, in several of them, resembles paper. They consist of twenty-four species; the animal a tethys.

Donax, is a genus very nearly allied to the cockles, differing principally in the shell, which is truncated on one of its sides; whence the species, of which there are nineteen, got the name of flat-sided cockles; one of the most curious of these is referred to in the Conchology Plate XVI. fig. 14. The animal is a tethys.

Venus, is an extensive genus, containing some very curious individuals; the shells which are in great request with conchologists, and one of the most valued is Venus Dien, represented in the above-mentioned Engraving. at fig. 6; a shell that is very beautiful and rare. The inhabitant is a tethys; and there are no less than one hundred and fifty-four species.

Spondylus, is a genus distinguished by numerous rugged spines; hence known by the name of the thorny offer. The shell is a tethys; and there are four species; one of which, spondylus gafaropus, is shown in the above-named Engraving, fig. 3.

Chama, is a genus in which the species vary surpris-ingly in size; one being found remarkably small, while others, and particularly the chama gigas, is sometimes found of such an astonishing capacity as to weigh several hundred and thirty-two pounds, and the inhabitant, which is a tethys, is so large as to supply a dinner for one hundred and twenty people; and is strong enough to snap off a man's leg or arm by the closing of its shell, which it can open and shut with great celerity.

Pinna, is a genus distinguished by the articulation of the hinge; the generic character of which is not distinctly a bivalve, being thus connected, in both divisons the animal is a tethys; and there are eighty-four species, all of which produce a delicate kind of byllus, which is woven into a very fine silk, and highly prized by the Italian ladies. The finest specimen of this animal, the pinna nobilis, is given in the Conchology Plate XV. fig. 9. and they are found abundantly in the Asiatic, Mediterranean, and Indian seas; and also in the American Ocean.

With univalve shells. The Nautilus, we have placed at the head of this division, because it is confessedly the most magnificent
of all shells; the external and internal lamina of which, together with its beautiful arrangement of spiraled chambers, are correctly delineated in the Conchology Plates II. and III. This genus contains thirty-one species, several of which are found fossil, particularly the species called belonita; which in England received anciently the name of "thunderstone," from a notion that they are thunderbolts, and generally to be found after a shower of rain; but none of these peculiarities in natural history and mineralogy have completely removed these vulgar errors. Many small species of nautilis are found on the shores of Great Britain; but the pompilus, figured in the above-mentioned plate, is an inhabitant of the Indian and African seas.

The Argonauta, called also the paper nautilus, from its thin texture, is set down by conchologists as the primeval navigator; and indeed the fight of this shell when under sail, and the fragility of its conductor, attract equally our astonishment and admiration. See the article Conchology, vol. v. p. 24. There are only three species in this genus; the shell of which, argonauta argo, is given in the Conchology Plate V. fig. 1. The animal is a cephalopod, or a chiton.

Conus is a very extensive genus, comprising the families of univalve shells of an oblong conical figure, with truncate or gibbous base. Many rich and diversified colours, displayed with a regularity and beauty far beyond the ingenuity of man, have contributed to render some of these shells of incredible value in collections. They are chiefly inhabitants of the Asiatic and African seas. There are seventy-two species, besides many varieties; some of which have been dignified with splendid names by conchologists; such as cedo nulli, imperial crowns, tulips, admirals, &c. for their delineations of which, some of which have been highly prized. Amongst these are: buccinum, represented in the Conchology Plate XIII. fig. 2; flammeum, in Conchology Plate VIII. fig. 3; harpa, in the last mentioned plate at fig. 2; undatum, in the Helminthology Plate IV. fig. 11; fulvatatum, in Conchology Plate XII. the two figures in both corners at bottom; carioleum, in the same plate, figure in left hand corner at top. In all the species the animal is a limax.

Strombus, a genus of turrited or spiral-shelled worms, with the aperture considerably dilated; but the canal or gutter, contrary to the preceding genus, leans toward the left; which is its principal generic character in the Linnean classification. Among conchologists, however, the class of Strombi is chiefly confined to the slender and delicate forms exhibited in the Conchology Plate XII. under the title of Strombiformes; of which Linæus only takes in such as have, beaks or gutters projecting at top, or branching out into claws, as in Strombus pes pelicanus, in the Helminthology Plate IV. fig. 12. These constitute the first division in this order, and are distinguished thus: "A lip projecting into linear divisions or claws."—One of these shells, the most rare and valuable, is the Strombus chiragra, delineated in the Conchology Plate XIV. fig. 1. The dilatæ, or winged shells of conchologists, viz. such as have the right margin or lip expanded in a wing-like shape with age, are all included in this genus; as are a great number of the rocks or murices of the ancients. In this genus the animal is a limax; and there are fifty-three species.

Murex, a genus of very considerable extent, containing no less than one hundred and eighty-two species, divided into five families or genera as follow: 1. Those armed with thorns or spines, with the tail or beak produced: a specimen of which, murex tribulus, the thorny woodcock, is given in the Conchology Plate XIV. fig. 6. 2. Those whose futures are expanded into crispated foliations, with the beak abbreviated, called purpurea by conchologists: specimens of which are given in the last-mentioned plate at fig. 8. in the Conchology Plate XIV. fig. 2, murex ramose; and at fig. 4, in the same engraving, murex scopios. 3. Those with thick protuberant futures; as the murex nebris, exhibited in the Conchology Plate VIII. fig. 8. 4. Those without a manifett beak, and more or less spinous; as the murex melongera, represented in the last-mentioned Engraving, at fig. 7. 5. Those with an elongated clofed beak, unarmed with spines; as the murex Babyloniæ, delineated in the Conchology Plate XIV. fig. 6, a most valuable shell, called by conchologists the Tower of Babel: other examples of shells of this fifth division are also given in the Conchology Plate XIII. fig. 1, murex tritons, the trumpet of war; and at fig. 7, in the same Engraving, the beautiful species called by Linæus murex manilus. 6. Those with a very short beak or tail, the shell fulbute, long, and tapering; as represented in Plate IV. fig. 11, murex aluce. The animal, in all these six families of murices, is a limax, or beak.

Trochus is a very beautiful genus, containing one hundred and thirty-two species, divided into three classes...
clades or families, according to the form or character of their shells, viz. 1. Umbilical, erect, with the pillar perfect, as in trochus; 2. Umbilical, imperfect, as in conchology plate IX. the right hand corner at top; 3. Umbilical, in the Conchology Plate IX. the shell placed in the centre; 4. Umbilical, in the Helminthology Plate IV. 2. Imperforate, erect, with the umbilicus or navel closed; a specimen of which is given in the Conchology Plate IX. the right hand corner at top; 5. Imperforate, this is the trochus tuber. 6. Imperforate, with an exerted pillar, and falling on one side when set upon the base; exemplified in trochus telephogon, twelve beautiful varieties of which are exhibited in the Conchology Plate IX. placed all round; with the points towards the centre; these are named by some conchologists, pyramidea, or pyramidal shells. 7. The animal, in all three of the divisions, is a limax. 8. Utaho, is a very extensive genus; and some of the shells belonging to the animals of this clade are of prodigious value. Many of them appear to be closely allied to the buccinea genus; but are readily distinguished by attending to the Linnaean generic characters, viz. "spiral solid; aperture orbicular, and contracted."

These are united shells have been usually called terebellas. The animal is a limax; and the number of species amounts to one hundred and fifty-one, which are arranged in five distinct families, according to the similarity of their shells. 1. Those with the pillar-margin of the aperture dilated, and imperforate; as exemplified in turbo orbicularis, the common periwinkle shell. 2. Solid, and imperforate, as in turbo orbis, exhibited in the Conchology Plate X. fig. 13, 14; in that beautiful specimen in turbo sarmaticus, delineated in the same engraving at fig. 12; and in turbo eideris, shown at fig. 15, 16, in the same plate. 3. Solid, and umbilicate or perforated; as in turbo delphinus; twelve elegant varieties of which are given in the Conchology Plate XI. 4. Cancellate; as in that rare species turbo scalaris, the wentletrap; delineated from nature in the Conchology Plate X. fig. 17; it is a shell in great estimation. 5. Tapering; as exemplified in turbo terreus, Conchology Plate XIV. fig. 9; and in turbo inornatus; exhibited in the two circular arrangements of tapering shells, in the Conchology Plate XII. The wentletrap in this genus, and the cedo nullum among the cones, are the most valuable of all shells in collections. See Conchology, vol. v. p. 26, 27.

Helix, a most numerous genus, containing the whole tribe of terebellas, which amount to no less than two hundred and sixty-seven species, described in p. 327-354. 1. Helix, a genus of which the animal is a limax, and which are named navalis, utriculus, and sterca. The modem destructive of the genus is the terrapene. The most destructive of the same species, the terebellas, is the Sterca, and there are forty-eight species. Of the number of openings is invariably the same in different species. It has been doubted whether any of those described by writers are truly of this genus.

Patella, is the most extensive genus of all the tellucous tribes, comprehending no less than two hundred and forty species; the animal is a limax; and the shell is orbicular, and without spire. They are named limpets, from their resemblance to a little plate, (patella;) and are more or less conic without, and concave within. Some species have the apex or top entire; others perforated; the chambered limpets are distinguished by a peculiar kind of projecting process, or lip within; most have the margins entire, but some have an indented or irregular in that part; and other species are completely ciliated. The inner face of the shells have been usually called terebellas. The animal is a limax; and the number of species amounts to no less than two hundred and sixty-seven species, described in p. 327-354. 1. posed of particles of sand, broken pieces of shell, and sea-weed, united to a membrane by a kind of glutinous cement; whence it has very much the resemblance of a coraline. There are twenty-five species now ascertained, one of which, _fusella abortiva_, is correctly defined in the Helminthology Plate IV. fig. 29.

In this group, the history and economy of the teutaceous tribes, the annexed Helminthology Plate IV. has been constructed; from observations made on the living animals in their natural state. All those which inhabit the bivalve and bivalve shells, are endowed with the faculty of opening and shutting them at pleasure, for the purpose of obtaining their food, and for withstanding the adversary, by which they are perhaps by the fimbriae which skirt the shell; but the shell of a model, cockle, oyster, &c. directs them in all their haunts after prey and which, though blind, and imprisoned, yet unerring directs them in all their haunts after prey; and which, on the slightest touch or disturbance, warns them of danger, and excites the insatiable elosing of their valves, and thus foil ing an enemy. Their sense of touch must be extremely delicate, since the sense point communicated even to gently to the external part of the sea-weed, united to a membrane by a kind of glutinous substance. The fullness is divided in a circular direction in search of their food. In this figure the scalpelium is shown in its quiescent state, fixed by its tube, and its tentacu la or feelers retracted and at rest.

At fig. 5, the same animal is represented with its tentacu la projected, and the valves or feelers somewhat opened, to receive its nourishment. It is furnished with thirteen feelers, six on each side, and one at the back, curved, and inclining the others. The peduncle is beautifully annulated, soft, and flexible.

Fig. 6, represents the _mutia pholadis_, a very curious species of mussel, in the act of opening its valves to take the food, and of throwing out its subulate foot or pine, and the byssus or threads with which it adheres to extraneous bodies. Fig. 7, displays the same animal fully expanded; its foot or hook projected, and its byssus or beard of silky filaments crisp up, as it always appears when not attached or sticking to any foreign body. The trunk or foot of this animal is divided into two tubes or valves at its extremity, which are its mouth, of a bright red colour, and finely ciliated; the body is carnosous, of a whitish yellow colour, and when swollen out appears to be too large for its shell. It inhabits the North Seas.

Fig. 8, is the _ostra fucis_, or _peelen friarius_ of Muller, a small species of scallop, generally found among fuci or sea-weeds. It is here delineated in the act of affixing itself by its filaments or byssus to some extraneous body, its siphunculus exerted, and its siphon expanding for the purposes of nutrition. Fig. 9, shows the valves laid open, to demonstrate the internal structure of the animal, which is represented in a retractile quiescent state, the byssus crisp up, the carnous body, ligula, and filamen, contracted and at rest, and the byssus or beard of silky filaments crisp up, as it always appears when not attached or sticking to any foreign body. This animal is divided into two tubes or valves at its extremity, which are its mouth, of a bright red colour, and finely ciliated; the body is carnosous, of a whitish yellow colour, and when swollen out appears to be too large for its shell. It inhabits the North Seas.

The inhabitants of the univalve shells, possessing a less complex arrangement of parts, are more simple in their nature, as well as in the structure of their dwellings. The helix, or domestic snail, in its habits and economy, at once displays the manners and instincts of the whole univalve tribe. See the article _Helix_, p. 337. This class is certainly more exposed to a devouring enemy than the bivalves; because they can never perfectly close their shell, but only by a slight operation or lid at its mouth; and even this is not constant in all the genera. Besides the univalve animals are for the most part extremely slow in advancing from and returning into, their shells; whereas those of the bivalves are altogether as nimble and expert. In their mode of propagation, however, a strict similarity prevails, since they are in general oviparous, with very few instances of the viviparous kind. One of these, however, we shall illustrate, as being highly curious.
snail, (*Helix vivipara*), as given by Müller, in the act of parturition. The head of the parent snail is seen emerged from the shell, just far enough for the orifice in the side of its neck, (called, in all these vernacular tribes, the *lateral pore*,) to protrude the sexual organ charged with its yellow sperms, which is followed by the reproductive into life, completely formed; and, as soon as its young are delivered, the membrane or womb is redrawn within the shell. The shell is very white, with three brown bands shaded with yellow; the snail is red. In some varieties (particularly in that described by Linneus, *B*), the shell is more shining and glossy, and the included animal of a blackish colour.

Fig. 14, is a correct delineation of the *Buccinum undatum*, in its natural creeping posture, with the body wholly protruded, and the limax carrying its shell upon its back. The operculum is a fritate horny shell affixed to its tail; and when the animal retires to a quiescent state, the extremity of the tail laps over the head, and then the shell or operculum exactly closes the aperture of the shell. At 4, just above the canal or siphon, are shown three of its ovula or eggs. This is an inhabitant of the European seas, and is regarded as a fine specimen.

Fig. 12, exhibits curious univalve shell, called *Strombus phas pelcani*, the pelican's or corvorant's foot, with the valuable shell, or wreath, with which the hind-part of the snail is covered, and then the flied or opercule exadly closes the aperture of the shell. Fig. 15, is a correct delineation of the *Buccinum undatum*, a minute variety of the snail-shell, is said to be a limax; but this individual is here considerably magnified in order to distinguish its singular construction.

Fig. 17, the *Patella anoma*, or anomalous limpet. It is a very singular species. The animal possessing the limpet-shell, is said to be a limax; but this individual differs from all others, either of its own or of other genera. This animal is formed of two tough spiral-shaped bodies, which is followed by the reproductive into life; the fringes confiding of bluish rigid hairs or filaments, united to the lobes by a blue tendon: the ovaries consist of two vascular bodies, foliaceous or branched, and of an orange colour; the ovula are globular, and of a white grey while in the ovarium; purple when first excluded, and orange when the young are fit to emerge into life. The foliated ovaries, with three of the eggs, are correctly exhibited at 6. In its natural state it is about the size of a silver penny; but is here considerably magnified to distinguish its singular construction.

Fig. 18, the *Ferrula perforata*, much magnified, to show its beautiful structure. The shell is delicately white, and spirally contorted, growing leftwards towards the centre. The animal is a terebella, furnished with an elongated proboscis or sucker, enlarged at the extremity into a cup-shaped mouth, white externally, and deep red internally, which it can advance and withdraw at pleasure. The head is likewise furnished with six pinnated or branched tentacula, which it throws out to act as food-organs, having its own peculiar parts, to which is attached at the extremity of the proboscis, which then serves as an orbicular shield or operculum. Fig. 19, exhibits a group of these minute animals in their natural state and size, as found attached to the fronds of different species of fuc, which have the appearance of being ornamented with fillet, and with festoons, lying unprostrate, with the little animal in its quiescent posture. In form, it has the exact resemblance of a hydatid, its body a gelatinous or membranaceous vesicle, appended to a small neck and head, with transparent globules, filling the abdomen like young *Tetrahydra*.

This is evidently the ovarium, filled with ovula in an advanced state. The animal is a limax, generally found attached to sea-weed. It is of an ash-brown colour; its body is marked with brown channels, and truncated on the fore-part; it protrudes from a large gelatinous mass, as if coming out of a sheath. The fringes consisting of bluish rigid hairs or filaments, united to the lobes by a blue tendon: the ovaries consist of two vascular bodies, foliaceous or branched, and of an orange colour; the ovula are globular, and of a white grey while in the ovarium; purple when first excluded, and orange when the young are fit to emerge into life. The foliated ovaries, with three of the eggs, are correctly exhibited at 6. In its natural state it is about the size of a silver penny; but is here considerably magnified in order to distinguish its singular construction.

Fig. 17, the *Patella anoma*, or anomalous limpet. It is a very singular species. The animal possessing the limpet-shell, is said to be a limax; but this individual differs from all others, either of its own or of other genera. This animal is formed of two tough spiral-shaped bodies, which is followed by the reproductive into life; the fringes confiding of bluish rigid hairs or filaments, united to the lobes by a blue tendon: the ovaries consist of two vascular bodies, foliaceous or branched, and of an orange colour; the ovula are globular, and of a white grey while in the ovarium; purple when first excluded, and orange when the young are fit to emerge into life. The foliated ovaries, with three of the eggs, are correctly exhibited at 6. In its natural state it is about the size of a silver penny; but is here considerably magnified in order to distinguish its singular construction.

Fig. 18, the *Ferrula perforata*, very much magnified, to show its beautiful structure. The shell is delicately white, and spirally contorted, growing leftwards towards the centre. The animal is a terebella, furnished with an elongated proboscis or sucker, enlarged at the extremity into a cup-shaped mouth, white externally, and deep red internally, which it can advance and withdraw at pleasure. The head is likewise furnished with six pinnated or branched tentacula, which it throws out to act as food-organs, having its own peculiar parts, to which is attached at the extremity of the proboscis, which then serves as an orbicular shield or operculum. Fig. 19, exhibits a group of these minute animals in their natural state and size, as found attached to the fronds of different species of fuc, which have the appearance of being ornamented with fillet, and with festoons, lying unprostrate, with the little animal in its quiescent posture. In form, it has the exact resemblance of a hydatid, its body a gelatinous or membranaceous vesicle, appended to a small neck and head, with transparent globules, filling the abdomen like young *Tetrahydra*.

This is evidently the ovarium, filled with ovula in an advanced state. The animal is a limax, generally found attached to sea-weed. It is of an ash-brown colour; its body is marked with brown channels, and truncated on the fore-part; it protrudes from a large gelatinous mass, as if coming out of a sheath. The eyes are like two black points at a distance from each other in the fore-part of the body; and there is not the least indication of a head. The margin of the body is sometimes so bent as to have some resemblance to an ear. The gelatinous mass, with which the hind-part of the snail is covered, is shown three of its ovula or eggs. This is an inhabitant of the European and American seas; and the shell is valuable.

Fig. 13, represents that curious species called *Bulla labera*, of its natural size. It is shown, first standing on its back, and then lying prostrate, with the little animal in its quiescent posture. In form, it has the exact resemblance of a hydatid, its body a gelatinous or membranaceous vesicle, appended to a small neck and head, with transparent globules, filling the abdomen like young *Tetrahydra*.

This is evidently the ovarium, filled with ovula in an advanced state. The animal is a limax, generally found attached to sea-weed. It is of an ash-brown colour; its body is marked with brown channels, and truncated on the fore-part; it protrudes from a large gelatinous mass, as if coming out of a sheath. The eyes are like two black points at a distance from each other in the fore-part of the body; and there is not the least indication of a head. The margin of the body is sometimes so bent as to have some resemblance to an ear. The gelatinous mass, with which the hind-part of the snail is covered, is shown three of its ovula or eggs. This is an inhabitant of the European and American seas; and the shell is valuable.

Fig. 12, exhibits curious univalve shell, called *Strombus phas pelcani*, the pelican's or corvorant's foot, with the valuable shell, or wreath, with which the hind-part of the snail is covered, and then the flied or opercule exadly closes the aperture of the shell. Fig. 15, is a correct delineation of the *Buccinum undatum*, a minute variety of the snail-shell, is said to be a limax; but this individual is here considerably magnified in order to distinguish its singular construction.

Fig. 20, the *Ferrula perforata*, very much magnified, to show its beautiful structure. The shell is delicately white, and spirally contorted, growing leftwards towards the centre. The animal is a terebella, furnished with an elongated proboscis or sucker, enlarged at the extremity into a cup-shaped mouth, white externally, and deep red internally, which it can advance and withdraw at pleasure. The head is likewise furnished with six pinnated or branched tentacula, which it throws out to act as food-organs, having its own peculiar parts, to which is attached at the extremity of the proboscis, which then serves as an orbicular shield or operculum. Fig. 19, exhibits a group of these minute animals in their natural state and size, as found attached to the fronds of different species of fuc, which have the appearance of being ornamented with fillet, and with festoons, lying unprostrate, with the little animal in its quiescent posture. In form, it has six cirrhiated fins or feet, three on each side, whereby it moves itself forward in its tube; and as it advances, it forms to itself a new crust or shell. About the centre of the abdomen is placed a circular body, which is the matrix or ovarum, whence the eggs are excluded, adhering to the parent animal till they emerge into life, when they are excluded at the mouth of the tube to form new habitations or combs for themselves.—See all these genera more particularly described, and their natural history elucidated, under their respective titles in this work.

ZOOPHYTES, OR PLANT-LIKE WORMS.

This order seems defined by nature to connect the animal with the vegetable life; and hence the individuals classed under this arrangement, have been occasionally denominated the *left* of animals, and the *frail* of plants. Most of them take root, as it were, and grow up into plants; multiplying life in their branches and deciduous buds, and in the transformation of their animal and vegetative parts. These are therefore zoophytes, but are defective of animation, and the power of locomotion; and zoophytes are as it were plants, but furnished with sensitive, and the organs of spontaneous motion. Plants therefore resemble zoophytes, but are defective of animation, and the power of locomotion; and zoophytes are as it were plants, but furnished with sensitive, and the organs of spontaneous motion. Of these, some are soft and naked, properly called *zooplas*; others are covered with a hard shell, hence denominated *calciplas*. Of this last division the first
Helminthology.

Leophytes, or Plant-like Worms.
first class of corals consists, which forms several distinct genera; while the other produces softer corals, and corals, sponges, animal flowers, &c.

The genera are as follow:

1. Tubifera. This is a coral confiding of erect, hollow, cylindrical, branched tubes, in which the animal is a hydra or polype, growing in a branched form, and covered with turbinate pores. There are thirty-four species, some of which are very beautiful, of various colours, and of a large size, appearing in the form of round cells, some with thin, others with yellow or blue-grey. They inhabit the Indian and American seas, the West Indies, Mediterranean, and European seas. A specimen of the genus is delineated in the annexed engraving at fig. 4.
